In the same century in which the Cossacks thus signalized their victorious reaction to the pressure of the Nomads on the south-eastern borders of Russian Orthodox Christendom, another frontier became the principal recipient of external pressure upon Russia and concurrently the principal focus of Russian vitality. In the seventeenth century, Russia experienced, for the first time in her history, a formidable pressure from the Western World. A Polish army penetrated to Moscow and remained in occupation of the Kremlin for over two years (20th September, 1610, to 22nd October, 1612), and soon afterwards Sweden barred out Russia from the Baltic by making herself mistress of the whole eastern coastline of that sea from Finland southwards to the Dvina, where she marched with the United Kingdom of Poland-Lithuania.³ The century had barely closed when Peter the Great retorted to this Western pressure by founding Petersburg in A.D. 1703 and displaying the flag of a Russian Navy, in the Western style, on Baltic waters. As the capital of a Russian Empire which did not cease to expand towards the south and the east till it had pushed its frontiers across the Caucasus and on to the Pamirs, Petersburg was even more 'eccentric' in its situation than Antioch had been as the capital of the Seleucidae.⁴ Nevertheless, the capital of the Russian Empire was retained in this fantastic city—founded by a political genius in a frozen swamp on the extreme northern verge of the habitable world—by the exigency of a pressure from the West which ever

¹ i.e. the Ural River—a name under which the Yaik has been given a curious notoriety by the caprice of our modern Western geographers, who have made this artery of the Eurasian Steppe into the conventional boundary between Europe and Asia.

² For a fuller account of the Cossacks, see an article entitled 'Russia, Germany and Asia' in *The Round Table*, issue of June 1918.

³ Sweden conquered Livland from Poland-Lithuania in A.D. 1621-5, after having compelled Russia, in a peace-treaty concluded in A.D. 1617 at Stolbovo, to sign away her precious strip of coastline at the head of the Gulf of Finland.

⁴ See pp. 143-4, above.

continued to rise until the steam was blown off at last in the great explosion of 1914-18. After that catastrophe, which shattered the pre-existent political structure of Europe and interposed a broad barrier of debris—the East-European ‘successor-states’—between Russia and the surviving Great Powers of the Western World, the capital of the Russian Empire, in its latest metamorphosis the U.S.S.R., promptly swung back from the eccentric position on the Western March in which it had remained fixed for more than two centuries to the position of greatest administrative convenience in the interior: that is to say, from Leningrad to Moscow.¹

In Japan

If we now take a comparative view of this history of the offshoot of the Orthodox Christian Civilization in Russia and the history of the offshoot of the Far Eastern Civilization in Japan, we shall observe, in Japanese history, an outflow of vitality and power from the interior into a march which closely corresponds to the first of the three movements in Russian history which we have just been examining. We have seen that the centre of gravity of the Orthodox Christian Civilization in Russia was transferred from the upper basin of the Dniepr—the region in which the offshoot first took root—to the upper basin of the Volga when this latter region was added to the domain of Russian Orthodox Christendom by the prowess of the Russian backwoodsmen. We may now observe that the centre of gravity of the Far Eastern Civilization in Japan likewise shifted from the region in which the offshoot first took root in this case—that is, from Yamato—to a region in the backwoods which was subsequently added to the domain of the Japanese Far Eastern Civilization: shifted, that is to say, from Yamato to the Kwanto. In the historical geography of Japan, Nara and Kyoto are the analogues of the Russian Kiev, while Kamakura and Yedo-Tokyo are the analogues, respectively, of the Russian Vladímir and the Russian Moscow. The contrast between ‘the Kiev Period’ and ‘the Moscow Period’ of Russian history reappears, with an accentuated sharpness, in the contrast between ‘the Nara and

¹ By the time when the capital was retransferred from Leningrad to Moscow under the Russian Communist régime, Moscow, which had lain within the north-eastern marches of Russia from the thirteenth to the sixteenth century of the Christian Era, had long since been relegated to the interior by the eastward and southward expansion of the Russian Empire. In this retransfer, however, there was another force at work besides *vis inertiae*. If, in one aspect, the retransfer of the capital of the U.S.S.R. from Leningrad to Moscow by the Russian Communists was an almost automatic recoil, there was also another aspect in which this transfer, like the contemporary transfer of the capital of the Turkish Republic from Constantinople to Angora by the Turkish Nationalists, was a deliberate move in a systematic campaign of social revolution. This aspect is referred to again in Part III. C (i) (d), vol. iii, pp. 200-2, and is dealt with further in Part IX, apropos of contacts in the Space-dimension between different civilizations.

Kyoto Period' of Japanese history (sixth¹ to twelfth century of the Christian Era) on the one hand and 'the Kamakura and Ashikaga Period' (A.D. 1184-1597) on the other. The first precocious and sophisticated bloom of the Far Eastern Civilization on Japanese soil at Nara and Kyoto has that exotic air of a hot-house plant, keeping alive by a *tour de force* in an unfavourable climate, which is also characteristic, though in a less extreme degree, of the first bloom of the Orthodox Christian Civilization on Russian soil at Kiev. And the passing of the sceptre in the twelfth century of the Christian Era from sophisticated Kiev to rude Vladímir—the natural breakdown of an artificial state of affairs—is analogous to the more violent and dramatic revolution in Japan through which, in the course of the same century, the régime of 'the Cloistered Emperors' of Yamato was overthrown and was replaced by that of the feudal nobility of the Kwanto. The new masters of Japan, like those of Russia, were men of war who had acquired land and power and military spirit in the process of enlarging the borders at the expense of the primitive peoples of the north-eastern forests (the Ainu being the counterparts, in the Japanese hinterland, of the Finns in the Russian). Thus in Japan, as in Russia, vitality flowed away from the sheltered interior towards the exposed frontier until eventually power followed suit.²

In the Minoan and Hellenic Worlds

In the Minoan World, which we may consider next, the quarter in which the heaviest pressure was felt was the frontier over against the continental European barbarians; and, in the course of Minoan history, vitality and power duly passed from the maritime interior to the continental European marches. When 'the Thalassocracy of Minos' was in its hey-day, the cultivated inhabitants of the unvalled imperial capitals at Cnossos and Phaestus, on the island of Crete, doubtless looked down upon the wardens of the marches who had to live a ruder life—cribbed, cabined, and confined within the clumsily massive walls of Tiryns and Mycenae—for fear of the barbarians at their gates. How much more elegant and comfortable to be protected, as the Eteocretans were, by the shapely wooden

¹ Strictly, 'the Nara Period' did not begin till the laying out of the first fixed capital of the Japanese Empire at Nara in A.D. 710. From a broader point of view, however, this period may be taken as coeval with the introduction of the Far Eastern Civilization into Japan. In this process the two major events were the importation of Mahayanian Buddhism into the Japanese Archipelago, via Korea, during the second half of the sixth century of the Christian Era, and the reorganization of the Japanese Imperial Government on the Chinese model of the T'ang in A.D. 645.

² The breakdowns of the Far Eastern Civilization in Japan and of the Orthodox Christian Civilization in Russia, which accompanied these shifts of the centres of gravity in the course of the twelfth century of the Christian Era, are examined in IV. C (ii) (b) 2, vol. iv, pp. 95-6, below.

walls of an Imperial Navy which was in sole and complete command of the estranging sea! Yet, here again, pressure administered a stimulus which eventually gave Mycenae and Tiryns the mastery over Phaestus and Cnossos. The pioneers who had won for the Minoan Civilization a footing on the European mainland, in defiance of the continental barbarians, by building those gigantic fortifications, found energy and enterprise to spare, from their task of holding their own on land, to compete with their imperial cousins¹ in Crete for the control of the sea. While they kept the continental barbarians at bay with one hand, they launched a battle-fleet with the other; and our archaeologists conjecture that it was a Mycenaean Armada which put a sudden and catastrophic end to the Minoan Thalassocracy by breaking through the boasted wooden walls of Crete and sacking the open city of Cnossos towards the close of the fifteenth century B.C.

When we pass on to the history of the Hellenic Civilization which was 'affiliated' to the Minoan Civilization, we find that in the Hellenic World, likewise, the continental European marches were the zone of greatest external pressure and that the vitality and power of the Hellenic Society tended to concentrate themselves at different points in this zone successively as the incidence of the pressure shifted hither and thither in the course of Hellenic history.

In the Greek Peninsula, the hegemony which was first held by a city-state situated in 'the Island of Pelops' passed from Sparta to Athens, on the continental side of the Isthmus of Corinth, and then from both Athens and Sparta to Thebes, on the continental side of Mounts Cithaeron and Parnes, until it came to rest at the roots of the Peninsula in Macedonia: the frontier state of Greece over against the continental European barbarians.² Similarly, in the

¹ This language is not intended to imply that these Mycenaean pioneers of the Minoan Civilization were Eteocretan colonists, or even that they were akin to the Eteocretans in race or linked with them by the bond of a kindred language. It is possible and even probable that the majority of the exponents of the Minoan Civilization on the mainland of European Greece were not colonists but converts. (On this question, see II. C (i) (b), vol. i, p. 101, footnote 1, with Annex II.)

² The writer of this Study vividly remembers how the continental character of Macedonia impressed itself upon him at the first view. He first visited Macedonia in the summer of 1912, at the end of a visit to the Kingdom of Greece within the frontiers as they then stood. Since the standard-gauge railway which now links Athens with Salonica had not been completed at that date, he travelled from the Peiraeus to Salonica by sea. He had been looking forward with interest to observing the political aspect of the passage from territory under Greek to territory under Turkish rule; but, as the steamer entered Salonica harbour, his eye was caught, not by the Turkish flag flying above the custom house, but by Austrian and German railway-wagons standing along the quay, on rails which ran without a break from Salonica to Vienna and from Vienna to Berlin. He then realized in a flash that this economic solidarity with Central Europe was the distinctive and fundamental characteristic of Macedonia, and that the political connexion with Turkey-in-Asia, though picturesque, was accidental and superficial. (For the history of the question whether the Hellenic Great Power in Macedonia was to be a monarchy—as it actually came to be—or a confederacy of city-states of the kind that was built up in Italy by Rome, see III. C (ii) (b), Annex IV, in vol. iii, below.)

Italian Peninsula, the hegemony which had first been held by Syracuse in the island of Sicily (an island which, in terms of human geography, is only insular in the same degree as the Peloponnese) was afterwards contended for between two Powers which were both situated on the continental side of the Straits of Messina: Samnium and Rome. Moreover, this contest was won, not by Samnium, who had both hands free for fighting her duel with her Italian neighbour, but by Rome, who was constrained to fight Samnium with one hand while she was employing the other in keeping at arm's length the Celtic barbarians who were pressing upon Italy from the heart of Continental Europe. Yet Rome beat Samnium and won the hegemony of Italy, not in spite of, but because of, the fact that she had previously taken over the wardenship of the continental march of Italy when the Etruscans had shown themselves unequal to the task;¹ for the pressure which had thus fallen upon Rome acted as a stimulus and not as a handicap.

From the days of Camillus to the days of Caesar, during the four centuries which it took the Romans to build up their empire, the peril which was their bugbear—more trying to Roman nerves than Carthaginian galley-beaks or Macedonian pike-heads—was the barbarian avalanche: the 'Gallicus Tumultus'; and the genius of Hannibal showed itself in nothing so much as in his decision to attack Rome from the quarter from which, in Roman eyes, an aggressor ever appeared the most formidable. In making the passage of the Alps and bringing the Celtic avalanche down with him in full force in his descent of the Italian slope, Hannibal was seeking to reproduce artificially, for the undoing of the Romans, the natural catastrophe which, some two centuries earlier, had overwhelmed the Etruscans. He was seeking to bring upon the Romans the destruction which, in Mr. Kipling's story, Mowgli brought upon Shere Khan when he sent the herd of buffalo stampeding down from the head of the valley upon the tiger who stood trapped in the valley-bottom. But the strategy which succeeded so brilliantly in the hands of the fictitious Indian changeling failed in the hands of the historic Carthaginian man of genius, because Hannibal's human antagonists reacted, in this desperate situation, quite otherwise than Mowgli's bestial victim. Instead of losing nerve, like Shere Khan, and turning tail, the Romans refused to

¹ Before the collapse of the Etruscan Power, Rome had held the wardenship of the Etruscan marches of Latium and had finally reacted to Etruscan pressure by a victorious counter-attack in which she had conquered and incorporated the Etruscan city-state which had lain closest to the Latin border: that is, Veii. In virtue of this original wardenship of the Etruscan marches, Rome had captured the hegemony of Latium from Alba Longa—another example of the phenomenon of the frontier prevailing over the interior, since Alba, ensconced among the hills that bear her name, was shielded from Etruscan attack by the Roman watch on the Tiber.

'despair of the Republic' and turned at bay; and in defeating Hannibal and his Celtic allies they determined their own destinies. The general result of the victory of Rome in the Hannibalic War was that the Roman Empire grew—and merged—into a Hellenic universal state. One particular result was that Rome won—and lost—the hegemony over the whole Hellenic World by becoming the sole warden of the continental European marches.

This devolution upon Rome of the sole responsibility for the defence of Hellenism against the continental European barbarians was manifest to the World, and was acknowledged even by the Romans themselves, when Augustus organized the Roman frontier along the longest diameter of the Continent from the mouth of the Rhine to the mouth of the Danube; but this vast extension of Rome's commitments, as compared with the local wardenship of the Italian march which she had originally taken over from the Etruscans, had devolved upon the Romans against their will and had still been repudiated by them in theory long after it had become an accomplished fact. The advance of the Roman frontier from the line of the Po, where it had stood at the outbreak of the Hannibalic War, to the distant line of the Rhine was a direct, though long-delayed, consequence of the Hannibalic War itself, in which the western corner of Transalpine Europe had become both the prize of victory and the key to the retention of its fruits.¹ The parallel advance of the frontier from the Po to the Danube was a direct consequence of Rome's victory over Macedonia and therefore an indirect consequence of her victory over Hannibal, since it was the Hannibalic War that precipitated the collision between Rome and Macedonia and also predetermined the outcome.

In this trial of strength between the Power which had become the warden of the continental European marches of the Hellenic Civilization in Italy and the Power which was the warden of the corresponding marches in Greece, Macedonia did not succumb to Rome without a struggle;² for the Macedonians had been trained in the same school of border-warfare as the Romans, and they too were redoubtable frontiersmen and barbarian-fighters in their degree. The Hannibalic War, however, had been an unprecedented ordeal from which the Macedonians had held aloof, while the Romans had been made by their Punic adversaries to pass through the fire like the children offered to Molech;³ and the burning fiery furnace had tempered the Roman steel to a cutting edge which clove the Macedonian buckler at one stroke and mercilessly shore through the living flesh. This figurative manner of speech is

¹ On this point see I. B (iv), vol. i, p. 40, above.

² For the increase in the vigour and effectiveness of the Macedonian resistance as the struggle proceeded, see II. D (iv), pp. 103-4, above. ³ Lev. xviii. 21, xx. 2; Jer. xxxii. 35.

literally borne out by the following description¹ of the effect upon the Macedonians' *moral* when they first encountered a weapon which the Romans had just adopted, in the course of the Hannibalic War, from some of the European barbarians in Hannibal's service. The incident was the sequel to a cavalry skirmish in Illyria between the Roman and Macedonian outposts in the opening phase of the campaign of the year 200 B.C.

'Philip reckoned that it would conduce to his popularity with the troops, and would increase their readiness to risk their lives in his service, if he looked after the burial of the men who had fallen in this reconnaissance; so he gave orders for the bodies to be brought to camp and buried in the sight of the whole army with military honours. Nothing, however, is so uncertain and so unpredictable as the psychology of the crowd; for the spectacle which was to have fortified the troops' *moral* actually had the effect of shaking it. In hostilities with their usual Greek and Illyrian adversaries, the Macedonians were only familiar with spear-wounds and arrow-wounds and occasional lance-wounds. They now saw the execution done by the Spanish sword: mutilated trunks with the arms shorn away, heads severed from bodies by strokes that had cleft right through the neck, intestines laid bare, and other horrors; and this ocular demonstration of the type of weapon and type of fighting-man that they now had to face simply threw them into a panic. The King himself was terror-stricken at the thought that he had not yet faced the Romans in a pitched battle; and accordingly he recalled his son, with the garrison that was guarding the Pelagonian Pass, to reinforce his own army, and thus exposed Macedonia to invasion by Pleuratus and by the Dardanians.'

Thus the Macedonian frontiersman, when he came to grips with the Roman, found himself as hopelessly outmatched in armament as Hector when he faced Achilles in his last battle. Yet, in that legendary combat, it was not only Hector who was fey. It was Achilles' doom to meet his death from a Dardanian arrow when he had laid his Trojan rival low; and the drama of Achilles and Hector was re-enacted to the bitter end by Rome and Macedonia. The King of Macedonia, in the shock of his collision with the deadly power of Rome, had thrown up his wardenship of the continental European marches of the Hellenic World in that vital section, covering the Greek Peninsula, which Macedonia had guarded hitherto. By withdrawing the frontier guard, he had exposed not only his own Kingdom but the whole of Greece to invasion by the Dardanian barbarians of the Upper Vardar Valley and the Illyrian barbarians of Scodra. But the responsibility which King Philip had thrown off in his extremity, as he went out to meet defeat at Roman hands, could not be repudiated by Philip's conquerors.

¹ Livy, Book XXXI, ch. 34.

Inexorably, the burden of vanquished Macedonia became the burden of victorious Rome; and it was Philip's abandonment of the old Macedonian border in the Vardar Basin in the year 200 B.C. that compelled Augustus, two centuries later, to advance the Roman border up to the Danube, as well as up to the Rhine, from the Basin of the Po. Thus, in the event, the Illyrian and the Dardanian, as well as the Spaniard and the Gaul, were brought within the frontiers of the Hellenic universal state by Roman force of arms; and so it was that Rome, in winning the hegemony of the Hellenic World from Carthage and Macedon, set up a train of events which inevitably transferred the hegemony to other hands again in the fullness of time.

For Rome had no peculiar magic.

The same arts that did gain
A power, must it maintain—

and Rome was no more capable than her predecessors and victims of maintaining a hegemony which had been gained under the stimulus of barbarian pressure after she had deprived herself of that stimulus in obedience to the very necessities of her new situation. In the last phase of Hellenic history, power and vitality flowed away once more from the interior to the marches; and this time the current left Rome stranded. The stimulus which had once nerved Rome to overcome Syracuse and Samnium and Carthage and Macedon now nerved Illyria and Gaul, in their turn, to dominate Rome herself. Some three centuries after Augustus had organized the Danubian frontier, the dominion which the first Roman Emperor had gathered into his hands for transmission to Roman successors was being exercised by the Illyrian Diocletian¹ and by the Dardanian Constantine;² and the Roman Empire was being governed, not from the banks of the Tiber nor even from Milan beyond the farther bank of the Po, but from two cities in the immediate hinterlands of the two continental frontiers: from Constantinople behind the Lower Danube and from Trier behind the Middle Rhine. In the last agony, when the Empire broke up and the Old Rome opened her gates to the Goths and Vandals, New Rome remained an impregnable city of refuge—never to be swamped by the barbarian waves that broke upon its walls from beyond the old front line. As for the Rhineland, it played the same role in the break-up of the Roman Empire as Transoxania in the

¹ Diocletian came from Doclea, a village in the Basin of the Lake of Scodra which, in 200 B.C., had been the nucleus of the Illyrian principality of King Pleuratus.

² Constantine's father, Constantius Chlorus, came from Naissus (Nish) in the Morava Valley, which lay within the borders of Dardania; and the family traced their origin back to another Dardanian—Claudius Gothicus—who had anticipated Constantius Chlorus, by several generations, in attaining to the purple.

break-up of the 'Abbasid Caliphate. Under the Merovingian régime it became the seat of the least ineffective and least ephemeral of all the defunct empire's 'successor-states'.

In the break-up of the Hellenic universal state, we can observe the stimulus of exposure to external pressure at work, not only in its general social effect upon whole territories and populations, but also in its particular personal effect upon single individuals. On this plane, it produced, 'in real life', the astonishing results which Mr. G. K. Chesterton has imagined in his fantasy 'The Napoleon of Notting Hill'. It transformed pacific men of letters into warlike men of action. In order to perform this miracle, the stimulus had, of course, to be administered with extreme violence. Pausanias the antiquarian, for example, was not made a new man by the momentary appearance, in the Asopus Valley, of a stray band of trans-frontier barbarians. Pausanias was a contemporary of Marcus Aurelius, and in that generation, some two centuries after the establishment of the Danubian frontier, such mishaps as this passed off without stirring men's souls to the depths, because they were regarded as curiosities rather than as portents. Even so, the vagaries of the outlandish Costoboci caused at least one citizen of one city in Greece to take up arms and die in battle for hearth and home in the manner of the past which was also to be the manner of the future;¹ while the more formidable upheaval in the hinterland of the Danubian frontier—a wave in a new movement of barbarian unrest in which the Costobocan raid on Greece was a casual ripple—compelled the philosopher-emperor to devote his last years to the uncongenial business of punitive border warfare.

The emergency which gave a Mnêsibûlus or a Marcus the occasion for a noble gesture was felt in grim earnest in the days of Athenian Dexippus, and yet more in the days of Cyrenaean Synesius and Arvernian Sidonius Apollinaris. In those latter days, no man could blind himself to the fact that the barbarian enemy was now within the gates of the Hellenic World; and this challenge to the inner citadel of Hellenism transfigured the last custodians of the Hellenic cultural tradition. The Gothic threat to Athens nerved the historian Dexippus to take up the sword in order to resume the pen when the tyranny was overpast. The Gothic threat to Auvergne, and the Berber threat to Cyrenaica, which did not pass

¹ 'The marauding band of Costoboci which raided Greece in my lifetime appeared, in the course of their raid, before the walls of Elates; whereupon, an Elatean gentleman, Mnêsibûlus, raised an armed force under his own command and succeeded in inflicting heavy casualties on the barbarians, though he himself was killed in action.' (Pausanias: *Descriptio Graeciae*, Book X, ch. 34.)

These Elateans who died for their country in the second century of the Christian Era were worthy of the epitaph in which the self-sacrifice of the Tegyatan had been commemorated in the fifth century B.C. by Simonides.

away, changed the whole course of Synesius's and Sidonius's lives. It turned them from cultivated and lethargic country-gentlemen into energetic barbarian-fighters and devoted shepherds of souls. By the third generation, when the intrusive barbarism had become endemic, the *ci-devant* heirs of the Hellenic culture in a derelict world had adapted themselves so well to the monstrous conditions of their new environment that when the Arvernian nobility answered the summons of their Visigothic overlords to march against the Franks, they acquitted themselves better than their barbarian comrades-in-arms in this contest between two barbarian 'successor-states' for the residuary legateeship of Rome in Gaul. At the decisive Battle of Vouillé (A.D. 507), Sidonius's grandson died gallantly on the battle-field with King Alaric when Alaric's own Visigoths ran away.

In the Western World over against the Continental European Barbarians

When we pass on to the history of our own Western Civilization which is 'affiliated' to the Hellenic Civilization, we find on the one hand that, in the Western World, the heaviest external pressure was felt, at first, in the same quarter in which it had been felt from first to last in the Hellenic World and in the Minoan World—that is to say, on the frontier over against the continental European barbarians. On the other hand we find that the Western, unlike either the Hellenic or the Minoan, reaction to the barbarian pressure was in the end definitively victorious. The barbarian frontier of Western Christendom on the Continent of Europe eventually faded out; and thereafter our Western Society found itself in contact here, no longer with barbarians, but with alien civilizations. The incidence of these new pressures stimulated the vitality of our Western Society to new responses in new forms.

In the first phase of Western history on the European Continent, the stimulating effect of the pressure from the continental barbarians declared itself in the emergence of a fresh social structure for a nascent society out of the debris of one of the 'successor-states' of the defunct Roman Empire: the barbarian principality of the Franks. The Merovingian Frankish régime had been Epimethean: its face had been turned towards the Roman past. The succeeding Carolingian Frankish régime was Promethean; for, although it incidentally evoked a ghost of the Roman Empire, its face was turned towards the Western future, and the ghost was only evoked—in the spirit of the cry 'Debout les morts!'—in order to assist the living in carrying out an almost superhuman task.¹ This

¹ See Part X, below, for the phenomenon of the Evocation of Ghosts in general, and in particular for this Carolingian evocation of a ghost of the Roman Empire.

complete transformation of the social functions of the Frankish Power—this transubstantiation of the Frankish body politic—was nothing less than a fresh celebration of the perpetual mystery of Life. 'Out of the eater came forth meat, and out of the strong came forth sweetness.'¹ And in what part of the Frankish domain was this fresh act of creation accomplished? Not in the interior but on the continental European March; not in Neustria, on soil fertilized by ancient Roman culture and sheltered from fresh continental barbarian inroads, but in Austrasia,² in a territory which bestrode the ancient Roman frontier and which was still exposed to constant assaults from the Saxons of the North European forest and from the Avars of the Eurasian Steppe. The measure of the stimulus which was administered by this external pressure to the Franks in Austrasia is given by the achievements of Charlemagne. Charlemagne's eighteen Saxon campaigns and his extirpation of the Avars are not incomparable, as sheer military triumphs, to Timur Lenk's steppe campaigns in which he crushed the Nomads of Mughalistan and Qipchak;³ and Charlemagne's military and political achievements were followed by the first faint manifestations of intellectual energy in the Western World—a feeble counterpart to the outburst of intellectual energy in Transoxania and Khurasan under the Timurids.⁴

This Austrasian reaction to the stimulus of pressure from the continental European barbarians—the reaction which came to a head in the career of Charlemagne—was not conclusive. For reasons which are examined at later points in this Study,⁵ it came to a premature standstill and was followed by a relapse. Accordingly, we find the Austrasian reaction reduplicated in our Western history by the Saxon reaction which came to a head, rather less than two centuries later, in the career of Otto I. The enduring (though exhausting) achievement of Charlemagne's career had been the incorporation of the domain of the continental Saxon barbarians into Western Christendom; and by this very success he had prepared the way for a transfer of the kingdom, the power and the glory from

¹ Judges xiv. 14.

² The very nomenclature 'Austria-Neustria', which makes its appearance in the Lombard as well as in the Frankish 'successor-state' of the Roman Empire, tells its own tale. 'Austria' is a new name for a new living commonwealth which has sprung from the soil of the derelict 'successor-state' in its eastern—i.e. continental—marches. 'Neustria' simply means 'Non-Austria': that is to say, the leavings of the debris which still cumber the ground on the rest of the derelict site after the new growth in the marches has manifested itself.

³ See pp. 146-8, above. Charlemagne, like Timur, though in a lesser degree, succumbed to the malady of Militarism and was inveigled by it into misdirecting his military energies from the periphery to the interior of his world; and Charlemagne's error, like Timur's, resulted—though this, again, in a lesser degree—in the collapse of the structure which he had built up. For the malady of Militarism, as illustrated in both Charlemagne's career and Timur's, see further IV. C (iii) (c) 3 (x), vol. iv, pp. 488-501, below.

⁴ For this, see pp. 148-50, above.

⁵ In II. D (vii), pp. 344-5, and in IV. C (iii) (c) 3 (x), vol. iv, pp. 488-91, below.

his own victorious Austrasia to the homeland of the vanquished and forcibly converted barbarians by pushing forward the continental European march of Western Christendom from Austrasia into Saxony and thereby exposing Saxony, instead of Austrasia, to the stimulus of continental barbarian pressure from the hinterland. In Otto's day, the same stimulus evoked in Saxony the same reaction that had been evoked by it, in Charlemagne's day, in Austrasia; and this time the counter-offensive of the Western Civilization against the continental barbarians was sustained until it reached its final objective.

Otto smote the Wends as Charlemagne had smitten Otto's own Saxon ancestors; and thereafter the continental frontiers of Western Christendom were pushed steadily eastward, partly through the voluntary conversion of the barbarians to Christianity and partly through their subjection or extirpation by force of arms. The Magyars and the Poles and the Scandinavians were converted at the turn of the tenth and eleventh centuries of the Christian Era by the prestige of Western Christendom under the Ottonid régime, as the Bohemians had been converted, two centuries earlier, by the prestige of Western Christendom under the régime of Charlemagne. The barbarians along the continental coastline of the Baltic were more recalcitrant. On this sector of the frontier, the Saxon frontiersmen had to follow up Otto's counter-stroke against the Wends in a stubborn border warfare that lasted some two centuries before they succeeded in definitively advancing the bounds of Western Christendom from the line of the Elbe to the line of the Oder. This result was achieved by the conversion of the Wends in Mecklenburg in A.D. 1161, and by the contemporary extirpation of their kinsmen in Brandenburg and Meissen.

Thereafter, in the thirteenth and fourteenth centuries, the task of 'Westernizing' the last remaining continental barbarians was carried on by the Germans with still greater vigour and effect through the instrumentality of two new Western institutions: the city-state and the militant monastic order. The Hansa Towns and the Teutonic Knights, between them, advanced the bounds of Western Christendom from the line of the Oder to the line of the Dvina, while, farther north, the Scandinavian converts to Western Christianity were winning fresh ground for Western Christendom and for themselves—the Danes in Estonia and the Swedes in Finland. That was the last round in this secular conflict; for, before the close of the fourteenth century of the Christian Era, the continental European barbarians, who had been pressing upon the frontiers of three successive civilizations over a total span of some three thousand years, had been wiped off the face of the Earth. By

A.D. 1400, Western Christendom and Orthodox Christendom, which had been entirely isolated from one another on the Continent by intervening barbarians no longer than five hundred years before, had come to march with one another continuously along a line extending across the whole breadth of the Continent from the coast of the Adriatic Sea to the coast of the Arctic Ocean.

It is interesting to observe how, on this frontier between a youthful Western Christendom and a senile continental European barbarism, the reversal in the direction of the pressure, which became constant from the time when Otto I took up Charlemagne's work, was followed by a transference of stimulus as the Western counter-offensive proceeded.

For example, the original Duchy of Saxony, west of the Elbe, suffered the same eclipse as a result of Otto's victories over the Wends that Austrasia had suffered, two centuries earlier, as a result of Charlemagne's victories over the Saxons themselves. Like Austrasia, Saxony owed the hegemony over Western Christendom which she inherited from Austrasia to the *esprit de corps* that was instilled by pressure from barbarians at close quarters; and, again like Austrasia, she lost her *esprit de corps*, and with it her hegemony, when this pressure was removed. Saxony actually lost her hegemony over the Western World in A.D. 1024: that is, as soon as the Wends beyond the Elbe had been thrown upon the defensive. She broke into fragments in A.D. 1182-91: that is, as soon as the frontier of the Western World had been definitively advanced, on this sector, from the line of the Elbe to the line of the Oder. Thereafter, when, in a later age of Western history, a state bearing the name of Saxony once again became a power in the Western World, this latter-day Saxony arose in the March of Meissen: that is, on one portion of the new ground which had been won for Western Christendom at the expense of the Wends during the two centuries of border warfare along the old Saxon frontier which had followed the reign of Otto I.

Again, as the continental frontier of Western Christendom was pushed farther and farther forward into the barbarian hinterland, the seat of 'the Holy Roman Empire' receded deeper and deeper into the interior; and simultaneously, as the vigour of the Western counter-offensive against the continental barbarians increased, the authority of 'the Holy Roman Emperor' diminished. The similitude of the Imperial office, which had been revived at the end of the eighth century of the Christian Era for the benefit of an Austrasian prince and had then passed from Austrasia to Saxony, did not continue thereafter to follow the ever advancing frontier. When the office fell, in due course, from Saxon hands in A.D. 1024, it passed

this time, not to the makers of the new marches of the Western World beyond the Elbe, but to a dynasty whose homeland lay in Rhenish Franconia. Moreover, from the advent of the Salian Dynasty to the Imperial throne in this year 1024 down to the formal extinction of 'the Holy Roman Empire', nearly eight centuries later, in A.D. 1806, each successive dynasty that held the office had its roots in the Rhine Basin—that ancient continental march of the Roman Empire which had been relegated to the innermost interior of the expanding Western World. The Franconians came from the valley of the Main, the Hohenstaufen from the valley of the Neckar, the Luxemburgers from the valley of the Meuse, the Hapsburgs from the valley of the Aar. At each successive transfer, the office passed to a dynasty which sprang from soil more remote from the continental frontiers of the Western World than the native soil of its predecessors; and concurrently, at each successive transfer, the Imperial authority grew weaker. It was less effective in Salian hands than in Saxon and in Hohenstaufen hands than in Salian, until the downfall of the House of Hohenstaufen was followed by 'the Great Interregnum' (A.D. 1254-73).

It is noteworthy that, during this practical break in the continuity of the Imperial succession to Charlemagne and to Otto I, the work of reacting against the pressure of the continental barbarians—a work which Charlemagne had first set on foot and which Otto had taken up again—was being carried on, and this with unprecedented energy and success, by other agencies than the Imperial authority: such agencies as the Hansa towns and the Teutonic Knights and the crowns of Denmark and Sweden. It is also noteworthy that the Hohenstaufen, who were seeking to preserve 'the Holy Roman Empire' *in extremis*, and the Hapsburgs and Luxemburgers, who were seeking to re-establish it after it had fallen into practical abeyance, all alike sought to restore some real function and importance and power to an office which had in fact become superfluous by combining it, once more, as it had been combined in the great days of the Carolingians and the Ottonids, with something in the nature of a wardenship of the marches. The Hohenstaufens sought a new basis for their power in the Kingdom of the Two Sicilies, which was a march of Western Christendom against both the Orthodox Christian World and the Arabic World. The Luxemburgers mounted to the throne of the Empire by way of the throne of Bohemia, and justified their tenure of the highest office in Western Christendom by their service in bringing the full light of Western Civilization into a region which had previously lain in the penumbra. Rudolf of Hapsburg made the fortunes of his family not by his acquisition of the Imperial office but by his

seizure of the opportunity which this gave him for adding the Austrian March of the Empire to his ancestral possessions in Swabia.

It was thanks to this permanent addition to the Hapsburg family inheritance that the Imperial office, which Rudolf had held for his lifetime, was reacquired by his descendants not much less than two centuries later. Yet the office would assuredly not have remained in the hands of the Hapsburgs permanently the second time any more than the first, and would probably not have remained in existence at all now that the ancient pressure from the continental European barbarians had been completely removed by the complete extinction of the barbarians themselves, if the Western World had not suddenly been subjected at this juncture to a new and formidable continental pressure from an alien civilization. The life of 'the Holy Roman Empire' was unexpectedly prolonged for another three centuries, and was permanently vested during the whole of this period in the House of Hapsburg, in consequence of the impact of the Ottoman Power upon the Western World in the Basin of the Danube. 'The Great Interregnum' which virtually began at the death of Frederick II Hohenstaufen and was nominally brought to an end when Rudolf of Hapsburg assumed the Imperial office a quarter of a century later, really continued until A.D. 1526, when, on the morrow of the Battle of Mohacz, Rudolf's descendant Ferdinand added the crowns of Hungary and Bohemia to the wardenship of the Austrian and Styrian marches and thereby founded the Danubian Hapsburg Monarchy, with which the Imperial office thenceforth remained indissolubly associated until it was finally extinguished in 1806 by a formal merger of the shadow in the reality.¹

Thus the vitality of 'the Holy Roman Empire' varied, during the course of the Empire's existence, in the same degree as the intensity of the external pressure that was being exerted from time to time, by barbarians or by alien civilizations, upon the continental frontiers of Western Christendom. The Empire lost vitality as the pressure from the continental European barbarians relaxed, and then recovered vitality when a new pressure came to be exerted by the 'Osmanlis'. Conversely, we find that the vitality of the barbarians who had remained beyond the pale of the Western Civilization and the *ci-devant* barbarians who had been brought just within the pale by conversion tended to increase as the pressure

¹ In August 1806 the Holy Roman Emperor Francis II Hapsburg formally renounced the style and title of 'Roman Emperor' in order to style himself thenceforward 'Emperor of Austria'—a titular solecism which was at the same time a tardy recognition of long since accomplished historical facts. (See the passage quoted from Lord Bryce in Part I. B (iv), Annex, vol. I, on p. 343, above.)

exerted upon them by the Western counter-offensive came to be intensified.

The Lithuanians, for example, as the last surviving pagans in Europe, drew upon themselves, in the thirteenth and fourteenth centuries of the Christian Era, the last impetus of the Crusading spirit in the Western World that survived the decisive failure of the Crusading enterprise in Syria. The head-quarters of the Teutonic Knights, which had been established at Acre, on the Syrian coast, until the fall of this sole remaining stronghold of the Crusaders in the Holy Land in A.D. 1291, were transferred, in 1308, to Marienburg on the easternmost arm of the delta of the Vistula; and during the next hundred years the Teutonic Order pressed Lithuania hard. This formidable Western pressure upon the Lithuanians in their homeland had the effect of stimulating the Lithuanians themselves to achieve sweeping conquests at the expense of Russian Orthodox Christendom in the upper basin of the Dniepr, and at the expense of the Eurasian Nomads in the sector of the Qipchāq Steppe that lay between the lower courses of the Dniepr and the Dniestr; and, as their struggle with the Order approached its climax, the stimulus increased to such a pitch that in A.D. 1363, when the Lithuanians were being worsted in their resistance to the Order's strategy of barring them out from their ancestral seaboard on the Baltic, they actually acquired a new seaboard on the remote shores of the Black Sea. The social energy and the military technique in virtue of which the Lithuanians were able to establish this far-reaching ascendancy over their non-Western neighbours had been acquired in the process of reacting to the pressure of their Western adversaries; and eventually this reaction became so powerful that it enabled the Lithuanians to launch a counter-offensive against the Teutonic Knights themselves.

This explanation of Lithuania's temporary political greatness as a reaction to the Teutonic Knights' contemporary Crusade is aptly conveyed in the heraldic emblem of the Lithuanian State: a galloping horseman clad—man and horse—in the elaborate plate-armour which was brought to perfection by the technique of Western armourers in the fifteenth century. This horseman is the last of the barbarians in a new guise. It is the woodland warrior of Lithuania who has taken unto him the whole armour of his Western adversaries that he 'may be able to withstand in the evil day, and, having done all, to stand'.¹ To the astonishment and confusion of the Teutonic Knights, he is bearing down upon them in their own accoutrements in order to trample them under foot on the field of Tannenberg.

This *tour de force*, however, was only achieved by the Lithuanian

¹ Ephesians vi. 13.

barbarian after he had adopted the religion and the culture as well as the military technique of the Western Civilization from which he was under pressure; and this conversion—which was the true turning-point in his struggle with the Teutonic Order—was brought about on the initiative, and through the agency, of a Western Christian neighbour and ally who had likewise become a victim of the Order's aggression and was likewise being stimulated into unprecedented activity by the necessity of fighting for his life. The Lithuanian's ally was the Pole, who had been converted to Western Christianity himself before the close of the tenth century of the Christian Era and had actually called in the Teutonic Order in the thirteenth century in order to assist him in extending the bounds of Western Christendom, on this sector of the frontier, at the pagan Prussian's and Lithuanian's expense. The Polish prince of Cujavia who gave the Teutonic Knights their first footing on the Baltic unwittingly laid the foundations of Poland's subsequent greatness by exposing her to a new German pressure which was far more formidable than the old Prusso-Lithuanian pressure from which he had intended to bring her relief. For the Teutonic Knights treated their neophyte Christian Polish hosts in much the same fashion as they treated the unconverted pagans whom they had been called in to fight; and the Poles, who at this time were still only feebly illuminated by the penumbra of the Western Civilization, were at first little more competent than their pagan neighbours to withstand a militant power which emanated from the heart of the Western World and which had at its command the most highly developed technique and organization that the Western Society had yet evolved. Accordingly, in the thirteenth century, the Teutonic Knights unceremoniously deprived the Poles of their ancestral Baltic seaboard in Pomerania while they were religiously depriving the Lithuanians of theirs in Prussia and Samogitia; and thereafter, in the fourteenth century, this same pressure from the same quarter produced the same reaction in Poland as in Lithuania.

While the Polish principalities of Cujavia and Masovia were being devoured by the Order, the nucleus of a new Polish Kingdom was being formed by Casimir the Great (*regnabat* A.D. 1333-70), whose reign was contemporary with the south-eastward expansion of Lithuania. The ultimate object of Casimir's work was to bring the offensive of the Teutonic Knights to a standstill; but Casimir's successors realized that Poland was no match for the Teutonic Order by herself; and, before trying conclusions with their assailants, they cast about for possible comrades-in-arms. The first combination which was achieved by Polish diplomacy—the personal union of the crowns of Poland and Hungary from A.D. 1370 to A.D.

1382, in the person of the Angevin King of Hungary, Louis the Great—was ephemeral and abortive, since the interests of the two parties did not coincide. Hungary had no quarrel with Poland's enemies nor Poland with Hungary's. The master-stroke of Polish statesmanship was the personal union between the crowns of Poland and Lithuania, which was achieved in A.D. 1386 by the grant of the Polish Queen Jadwiga's hand to the Lithuanian King Jagellon in consideration of Jagellon's conversion from his primitive Lithuanian paganism to Western Christianity.

It was Jagellon who opened the counter-offensive against the Teutonic Order by leading the combined forces of Lithuania and Poland to victory over the Knights at Tannenberg in A.D. 1410; and the work thus begun was completed by Jagellon's second successor on the Polish-Lithuanian throne in A.D. 1466, when he imposed on the Teutonic Order the Second Peace of Thorn. The First Peace of Thorn, in the year following the Battle of Tannenberg, had secured the retrocession of Samogitia to Lithuania. The fruits of the Second Peace were the cession¹ to Poland of Eastern Pomerania and Ermeland and the reduction of the Teutonic Order's domain in Prussia to the position of a geographical enclave in Polish-Lithuanian territory and to the status of a political dependency of the Polish Crown. Thus, in little more than half a century, the situations of the combatants had been completely reversed as a result of the combined Polish-Lithuanian reaction to the Teutonic Order's pressure. Before the year 1410, the dominions of the Order had extended along the continental coastline of the Baltic in an unbroken belt from the eastern frontier of the Holy Roman Empire all the way to the southern shore of the Gulf of Finland; and both Poland and Lithuania had been excluded thereby from access to the Baltic altogether. After 1466, the ancestral seaboard of Poland and Lithuania on the Baltic were once again in the hands of their original owners, while the two remnants of the Teutonic Order's dominions were now both insulated—by the restored 'Lithuanian Corridor' from one another, and by the restored 'Polish Corridor' from the Empire.

In the Western World over against Muscovy

Why did not Poland and Lithuania fall apart again after the pressure from the Teutonic Knights, which had originally brought them together, had thus been effectually counteracted? The ques-

¹ 'Cession', not 'retrocession', since the Polish territories which were recovered from the Teutonic Order in A.D. 1466 had been lost to the Order originally, some two centuries earlier, not by the Kingdom of Poland but by the then independent Polish principalities of Cujavia and Masovia. Before the conclusion of the Second Peace of Thorn in A.D. 1466, the two Polish principalities—or, rather, the remnants of them which had escaped annexation by the Order—had been absorbed into the Polish Kingdom.

tion is suggested by the actual course of events in Scandinavia—a region which had first come within the pale of the Western Civilization, by conversion to Western Christianity, contemporaneously with Poland, and had then been subjected, again contemporaneously with Poland, to pressure from certain more progressive and more efficient members of the Western Society. During the thirteenth and fourteenth centuries, while Poland was under pressure from the Teutonic Order, Scandinavia was under pressure from the Hansa; and in Scandinavia, as in Poland, the backward members of the Western Society succeeded in holding their own against their progressive assailants by resorting to the expedient of political combination. The personal union of the three Scandinavian kingdoms under the Treaty of Calmar in A.D. 1397¹ was a retort to the aggression of the Hanseatic League, just as the personal union of Poland and Lithuania in 1386 was a retort to the aggression of the Teutonic Order. The two unions, however, had very different histories. The Scandinavian Union of Calmar dissolved in A.D. 1520, after the sinews of the Hansa had been cut by the diversion of trade from the Baltic and the North Sea to the Atlantic in consequence of the discovery of America. On the other hand, the crushing of the Teutonic Order in 1466 was not followed by any corresponding dissolution of the parallel union between Poland and Lithuania. On the contrary, the Polish-Lithuanian Union was drawn closer in 1501 and still closer, by the Treaty of Lublin, in 1569, and it only ceased with the complete extinction of the political independence of the united commonwealth in 1795.

Why was the life of the Polish-Lithuanian Union prolonged almost to the close of the eighteenth century? And why was it completely extinguished then? The answer to these two questions is to be found in the imposition and the subsequent remission of a fresh pressure upon Lithuania and Poland from a new quarter. The Poles and Lithuanians had no sooner won relief from the pressure of the Teutonic Knights than they began to feel the pressure of the rising power of Muscovy. The expansion of Lithuania at the expense of the offshoot of Orthodox Christendom in Russia reached its farthest limits about the middle of the fifteenth century. Within the next century, the multitude of mutually independent and hostile states, into which the remnant of the Russian Orthodox Christian World had previously been articulated, was consolidated, by Muscovite conquest, into a single Russian Orthodox Christian universal state;²

¹ The definitive union which was achieved in A.D. 1397 had been preceded by tentative experiments in the direction of an All-Scandinavian union in the course of the fourteenth century.

² This function of the Muscovite Empire as a Russian Orthodox Christian universal state is studied further in IV, C (ii) (b) 2, vol. iv, pp. 88–92, below.

and in 1563—that is, half a dozen years before the Polish-Lithuanian Union of Lublin—this newly formed Russian universal state impinged upon the Western World by pushing back the eastern frontier of Lithuania, which had once run east of Smolensk, to a line running west of Polotsk on the Dvina. Thus the united commonwealth of Poland-Lithuania acquired a new function—and, therewith, a new vitality—as one of the marches of the Western World against a new pressure from Orthodox Christendom in Russia.

Poland shared this new function with the Kingdom of Sweden, which had broken off from the Scandinavian Union in A.D. 1520;¹ and the reaction of the Western Society to the new Russian pressure took the form of simultaneous Polish and Swedish counter-offensives. The Poles recaptured Smolensk in 1582 and held Moscow itself from 1610 to 1612; while the terms of the peace-treaty which was concluded between Sweden and Muscovy at Stolbovo in 1617 excluded Russia, in her turn, from all access to the Baltic.² In pushing their counter-offensives thus far, however, the Poles and the Swedes were guilty of an excess of zeal which brought its own retribution. The temporary presence of a Polish garrison in Moscow and the permanent presence of Swedish garrisons on the banks of the Narev and the Neva produced a profound psychological effect in Russian souls; and this inward spiritual shock translated itself into an outward practical act of equivalent magnitude: the deliberate 'Westernization' of Russia by Peter the Great.³ Through this portentous revolution, the continental frontier of the Western World was advanced, at one bound, from the eastern borders of Poland and Sweden to the distant lines along which the newly initiated Russian proselytes to the Western Civilization already marched with the Nomad occupants of the Eurasian Steppe and with the Manchu conquerors of China. Therewith, the wardenship of the marches of the Western Society, which Russia's Western neighbours and adversaries had been exercising somewhat too zealously at Russia's expense, was suddenly snatched out of their hands, as a result of Peter's astonishing counter-stroke, by Russia herself. The Poles and Swedes thus found the ground cut from under their feet. Their function in the Western body social was taken from them; and the loss of the stimulus which the exercise of this function had formerly administered was followed by a swift decay. Within little more than a century—reckoning from the beginning of Peter's

¹ See p. 175, above.

² For the effect produced upon the internal economy of Russian Orthodox Christendom by the application of this pressure from the Western Civilization in the seventeenth century through the agencies of Poland and Sweden, see pp. 157-8, above.

³ This 'Westernization' of Russia is examined in greater detail in III. C (ii) (b), vol. ii, pp. 278-84, and in Part IX, below.

effective rule—Sweden had lost to Russia all her possessions east of the Baltic, including her ancient dominion of Finland, while Poland had been erased from the political map altogether.

In the Western World over against the Ottoman Empire

It will be seen that Polish and Swedish history, from the opening of the sixteenth century of the Christian Era until after the close of the eighteenth, is best expressed in terms of the history of a foreign body social: in terms, that is, of the history of Orthodox Christendom in Russia. Poland and Sweden both flourished so long as they fulfilled the functions of anti-Russian marches of the Western Society; they both began to decline towards their fall so soon as Russian Orthodox Christendom had achieved the *tour de force* of filching this function from them. Let us now turn our attention to the history of the Danubian Hapsburg Monarchy, which can be traced back to approximately the same date as the histories of modern Poland and modern Sweden. Sweden upset the Scandinavian union of 1397 by breaking away from Denmark and Norway in 1520; Poland consolidated the Polish-Lithuanian union of 1386 by entering into the closer unions of 1501 and 1569; the Danubian Hapsburg Monarchy was brought into existence by the union of the Hungarian and Bohemian crowns with the Austrian patrimony of the Hapsburgs in 1526. Thus the Danubian Hapsburg Monarchy was modern Poland's and modern Sweden's contemporary; and we shall find that its history, like their histories, is best expressed in foreign terms. Poland and Sweden had their *raison d'être* in serving as marches of the Western Society against an Orthodox Christian universal state which had been established in Russia by the Muscovites. Similarly, the Danubian Hapsburg Monarchy existed in order to serve as a march of the Western Society against another universal state into which the main body of Orthodox Christendom, in the Balkan Peninsula, had been welded by the Osmanlis.¹ It was called into existence at a moment when the Ottoman pressure upon the Western World had suddenly become really formidable; it remained in the first rank of the Great Powers of Europe as long as the Ottoman pressure remained at its height; it began to decline as soon as the Ottoman pressure began to relax; and it finally fell to pieces in the same general war—the War of 1914-18—in which the Ottoman Empire received its *coup de grâce*.

The impact of the Ottoman Power upon the Western World began

¹ This function of the Danubian Hapsburg Monarchy as a carapace evolved by the Western Society, in order to protect it against the Ottoman impact, has been noticed already, by anticipation, in I. C (iii) (b), vol. i, on p. 156, footnote 1, above. The function of the Ottoman Empire as the universal state of the main body of Orthodox Christendom is discussed further below in Part III. A, vol. iii, on pp. 26-7, below.

with the hundred years' war between the 'Osmanlis and Hungary which culminated in the Battle of Mohacz (A.D. 1526). Before the opening of this long duel in A.D. 1433/4, the 'Osmanlis and the Westerners had only crossed one another's paths occasionally—and these occasions had arisen through the desultory interference of this or that Western Power in the distracted affairs of the Orthodox Christian Society with a half-hearted intention of preventing the 'Osmanlis from accomplishing their work of welding the main body of Orthodox Christendom together under Ottoman rule. This work, however, was substantially complete before the end of the fourteenth century of the Christian Era; it was not undone by the blow which Timur dealt the 'Osmanlis at Angora in A.D. 1402;¹ and, after a momentary pause, it was easily rounded off by Mehmed the Conqueror (*imperabat* A.D. 1452–81). It was not the annexation of Constantinople and the Morea and Trebizond and Qaraman, but the offensive against Hungary, that made the greatest demands upon Ottoman military energies in the fifteenth century.

Hungary, standing at bay under the leadership of John Hunyadi and his son Matthias Corvinus (*regnabat* A.D. 1458–90), was the most stubborn opponent whom the 'Osmanlis had yet encountered; and she was stimulated culturally as well as militarily by the tremendous effort involved in withstanding the Ottoman pressure almost single-handed. The disparity, however, between the respective forces of the two combatants was so great that the maintenance of the effort eventually proved to be beyond Hungary's strength; and the ultimate break-down of Hungary and formation of the Danubian Hapsburg Monarchy—in order to carry on Hungary's work with greater resources—were both portended in a number of preliminary and abortive attempts at political union between Hungary and several of her Western neighbours while the hundred years' war between Hungary and the 'Osmanlis was in progress. For instance, the Hungarian crown was fitfully united with the Bohemian during the years 1436–9 and 1453–7 and 1490–1526; both crowns were united with part of the Austrian patrimony of the Hapsburgs in 1438–9 and again in 1453–7; and Hungary alone was united with Austria from 1485 to 1490. Moreover, the crowns of Hungary and Poland were temporarily united for a second time from 1440 to 1444—this time in the person of a Polish and not a Hungarian sovereign, and with the object, not of bringing Hungarian reinforcements to Poland in her struggle with the Teutonic Order (the purpose of the previous Hungarian-Polish union in A.D. 1370–82),² but of bringing Polish reinforcements to Hungary in her struggle with the 'Osmanlis. These loose and ephemeral

¹ See II. D (iv), p. 102, above.

² See pp. 173–4, above.

unions were not enough to give Hungary the strong permanent reinforcement which she needed. They perhaps postponed but did not ultimately avert the crushing blow which the 'Osmanlis finally dealt Hungary at Mohacz; and it was only a disaster of this magnitude that could produce a sufficient psychological effect to bring the remnant of Hungary together with Bohemia and Austria into a close and enduring union under the Hapsburg Dynasty. This result was immediate. The triple union was accomplished before the end of the calendar year (A.D. 1526) in which the Battle of Mohacz had been fought; and it endured for nearly four hundred years—only to dissolve in the same calendar year (A.D. 1918) that saw the final break-up of the Ottoman Power which had delivered the dynamic blow at Mohacz four centuries back.

Indeed, from the moment of the Danubian Hapsburg Monarchy's foundation, its fortunes followed those of the hostile Power, whose pressure had called it into existence, in each successive phase. The heroic age of the Danubian Monarchy coincided chronologically with the period during which the Ottoman pressure was felt by the Western World most severely. This heroic age may be taken as beginning with the first abortive Ottoman siege of Vienna in A.D. 1529 and as ending with the second in A.D. 1682-3. In these two supreme ordeals, the Austrian capital played the same role—psychological as well as strategic—in the desperate resistance of the Western World to the Ottoman assault that Verdun played in the French resistance to the German assault in the War of 1914-18.¹ The two sieges were both turning-points in Ottoman military history. The failure of the first brought to a standstill the tide of Ottoman conquest which had been flooding up the Danube Valley for a century past. The failure of the second siege was followed by an ebb which continued thereafter—in a secular movement that persisted through all pauses and fluctuations—until the European frontiers of Turkey, which stood at the outskirts of Vienna from 1529 to 1683, have fallen back in our time to the outskirts of Adrianople. The Ottoman Empire's loss, however, has not been the Danubian Hapsburg Monarchy's gain; for the heroic age of the Danubian Monarchy did not survive the beginning of the Ottoman decline. The collapse of the Ottoman Power, which threw open a field in South-Eastern Europe for other forces to occupy, simultaneously released the Danubian Monarchy from the pressure which had been stimulating it into heroic activity hitherto; and the withdrawal of the former stimulus inhibited the Danubian Monarchy from taking advantage of the new opportunity. So far

¹ For the part played by sieges in making the fortunes of cities, see further II. D (v), Annex, pp. 400-1, below.

from entering into the heritage of the Ottoman Empire in South-Eastern Europe, the Danubian Monarchy now followed into decline the Power that had originally called it into existence, and eventually shared the Ottoman Empire's fate.

In the counter-offensive which drove the 'Osmanlis back from the walls of Vienna in 1683, the Hapsburgs found themselves at the head of an anti-Ottoman coalition which included Venice, Poland, and Russia; yet they never avenged the sieges of Vienna by laying siege to Constantinople. The peace-treaty of Carlowitz in 1699 restored to the Hungarian Crown the greater part of the Hungarian territory which had been lost to the 'Osmanlis in 1526; the peace-treaty of Passarowitz in 1718 actually carried the frontier considerably beyond the line along which it had stood on the eve of the campaign of Mohacz, two centuries earlier. The peace-treaty of Belgrade in 1739, however, revised the frontier of 1718 in the 'Osmanlis' favour and to the Hapsburgs' disadvantage. The fortress of Belgrade itself, which Hungary had always held against the 'Osmanlis during the fifteenth century and which Prince Eugene had wrested from Ottoman hands in 1717, was retroceded in 1739 by the Hapsburg Monarchy to the Ottoman Empire; and though Austrian armies momentarily re-occupied Belgrade in the Austro-Turkish War of 1788-91 and again in the General War of 1914-18, Belgrade had another destiny. It finally passed out of Ottoman hands in 1866 to become the capital of the Serbian 'successor-state' of the Ottoman Empire; and it was recovered by the Serbs from the Austrians in 1918 in order to become the capital of Jugoslavia, which is a 'successor-state' of the Hapsburg Power as well as of the Ottoman. As for the south-eastern frontier of the Danubian Monarchy, it remained virtually stationary, at the line fixed in 1739, for the remainder of the Monarchy's existence. During the hundred and eighty years which elapsed between the conclusion of the Peace of Belgrade and the moment when the Hapsburg Monarchy signed its own death-warrant in the Armistice of 1918, the Monarchy made only two further acquisitions of Ottoman or ex-Ottoman territory, and these were of trivial dimensions.¹ Between 1683 and 1739, however, the Hapsburg frontier in this quarter had been advanced sufficiently far to relegate Vienna from the situation of a frontier-fortress to that of an imperial capital in the interior; and this change made itself felt in the city's fortunes and character. The glory which Vienna had gained by keeping the Turks at bay in 1529 and 1682-3 was tarnished by the humiliation

¹ The first of the two was the acquisition of the Bukovina in 1774-7; the second was the acquisition of Bosnia-Herzegovina, which was occupied by Austria-Hungary in 1878 and annexed in 1908.

of French occupations in 1805 and 1809; and the Viennese, who had first made their name as the heroic defenders of Western Christendom, eventually became a by-word for an attractive but decidedly unheroic combination of fecklessness with amiability and softness with elegance.¹

If we look more closely, we shall see that the fate of Austria-Hungary was analogous to that of Poland-Lithuania. Just as the Polish counter-offensive against Russia at the end of the first decade of the seventeenth century precipitated the 'Westernization' of Russian Orthodox Christendom and thereby rendered Poland's previous *raison d'être*, as an anti-Russian march of the Western Society, superfluous, so the Austrian counter-offensive against the 'Osmanlis' in the last two decades of the seventeenth century precipitated the 'Westernization' of the main body of Orthodox Christendom in the Balkan Peninsula and thereby deprived the Danubian Hapsburg Monarchy of its *raison d'être* likewise.

The parallel extends to details. For example, when the 'Westernization' of Russia was taken in hand by Peter the Great, the Russian imperial revolutionary did not obtain his Western inspiration through the medium of his backward and hostile Western neighbour Poland. He addressed himself, by preference, to Germany and Holland and England: countries which were then leading the van in the progress of the Western Civilization and which were not alienated from Russia by any unneighbourly tradition of hostility. Similarly, in the main body of Orthodox Christendom, when the process of 'Westernization' was initiated—in a less deliberate and systematic way than Peter's—by the 'Osmanlis and their subjects under the stimulus of the Austrian counter-offensive, the 'Westernizers' did not address themselves to the Hapsburgs. The 'Osmanlis turned to France, who was their natural Western ally inasmuch as she was the House of Austria's principal Western rival.² As for the Orthodox Christian peoples of the Ottoman Empire, they welcomed the Austrians at first as Christian liberators, only to find that the status of barely tolerated 'heretics' under a

¹ In the long run, this relaxing effect of an abnormal exemption from the pressure of the human environment has counted for more, in the evolution of the Austrian *ethos*, than the stimulating effect of the physical environment in the shape of an abnormally rough country. (For the latter aspect of Austria, see II. D (ii), pp. 58-60, above.) For Vienna, as the capital of the entire Danubian Hapsburg Monarchy over a span of four centuries, has outweighed the rural and highland remainder of Austria. It is the Viennese and not the Tyrolese who has set the tone of Austria in these latter days.

² Francis I of France actually co-operated with Suleymân the Magnificent in naval operations against the Hapsburg Power in the Mediterranean in 1543. France had been rewarded for her friendship already in 1535 by receiving 'capitulations' (i.e. a charter of trading rights) from the Ottoman Government in advance of any other Western Power apart from the Italian republics. These 'capitulations' were confirmed and improved in 1740 as a reward for diplomatic services which the French Government had rendered to the Ottoman Government during the negotiation of the Belgrade peace-treaty between Turkey and Austria in 1739.

Roman Catholic régime was less to their liking than that of explicitly licensed 'unbelievers' under the Islamic dispensation. Tantalized, and at the same time disillusioned, by their brief spells of Austrian and Venetian rule in the early years of the eighteenth century, the Serbs and Greeks turned eagerly towards their Russian co-religionists when these demonstrated the advantages of 'Westernization' by their decisive victory over the 'Osmanlis in the Russo-Turkish War of 1768-74.¹ Yet the Orthodox Christians of the Balkan Peninsula were not long content to derive their Western inspiration through this circuitous and stagnant Russian channel. They soon learnt to draw the living waters from the fountain-head. They eagerly imbibed the ideas of the American and the French Revolution; and they profited by a personal intercourse with the leading nations of the West when Napoleon burst into the Levant, with his British adversaries in his wake, in the course of the General War of 1792-1815. Before the close of the Napoleonic Wars, the main body of Orthodox Christendom was in ferment with the leaven of Romantic Nationalism which was the Western spirit of the age;² and this was the beginning of the end of the Hapsburg Monarchy.

It was in vain that the Monarchy, under the stimulus of Napoleon's repeated blows, played a decisive part in the overthrow of Napoleon by its military intervention in 1813³ and thereafter dominated the Congress of Vienna. While, to outward appearance, Metternich had skilfully taken advantage of the 'restoration' of the pre-revolutionary régime in Western Europe in order to secure for the Danubian Monarchy a European hegemony which it had never quite succeeded in exercising at any previous stage of its history, the underlying reality was something altogether different. In reality, the Danubian Monarchy, in the 'post-war' period which began in 1815, found itself encircled, for the first time in its history, by a single ubiquitous adversary in front and rear—in Western Europe on the one side and in South-Eastern Europe on the other⁴ - and this adversary was the *Zeitgeist* of that very Western Society

³ See II. D (iv), p. 105, above.

⁴ The Janus-like physiognomy of the Danubian Hapsburg Monarchy is aptly symbolized in the double-headed eagle (a heraldic perversion of the Roman eagle, which the Hapsburg Monarchy shared, as its official emblem, with Prussia and Russia). While one head of the Austrian eagle was keeping watch eastward towards the Ottoman Empire, the other head was ever craning back westward into the interior of the Western World; and the Ottoman pressure had no sooner begun to slacken than the Danubian Monarchy began to divert its attention and energy disastrously from Near Eastern to Western affairs. This tendency, which first declared itself in the Thirty Years' War, is examined further in V. C (i) c, vol. v, pp. 325-7, below.

in which the Monarchy itself inextricably lived and moved and had its being.

Thus the situation of the Monarchy had really changed, in the course of a century, most profoundly to the Monarchy's disadvantage. A hundred years earlier, on the morrow of the Western General War of 1672-1713, the Danubian Monarchy had still been secure in front and rear alike. On its front, *vis-à-vis* the Orthodox Christian World, it was then already more than holding its own against the slackening pressure of the 'Osmanlis, while in its rear, *vis-à-vis* its fellow-members in the Western Society to which the Monarchy itself belonged, it was still performing the service and fulfilling the function which was its *raison d'être*, in its original capacity as the carapace which the Western body social had evolved from its own living substance in order to protect it against Ottoman sabre-strokes. On the other hand, in 1815, though the Danubian Monarchy had once again emerged from a general war even more triumphantly, to outward appearance, than in 1714, its *raison d'être*, and therewith its security, existed no longer. The sabre against whose strokes the West had sought protection under the Austrian carapace had fallen, by this time, out of the 'Osmanli's decrepit hands; and the osseous growth of the Danubian Monarchy, which could not be re-absorbed into the living tissues of the Western body social now that its function had become obsolete, was simply cramping the internal growth of the society whose life it had once preserved against a deadly attack from an external enemy. Since the foundation of the Danubian Hapsburg Monarchy in A.D. 1526, the cumulative effect of the Dutch, English, American, and French revolutions had called into existence in the Western World a new political order—a comity of nations—in which a dynastic state like the Hapsburg Monarchy was an anachronism and an anomaly. In attempting to restore the pre-revolutionary régime in Europe on the basis of the principle of Dynastic Legitimacy and in defiance of the principle of Nationality, Metternich provocatively transformed the Monarchy from 'King Log' into 'King Stork', from a passive incubus upon the life of the Western Society into an active internal enemy of Western progress—an enemy more harmful, in its own fashion, than the now decrepit external Ottoman enemy which the Hapsburg Monarchy had formerly kept at bay.

The Monarchy spent the last century of its existence in attempts—all doomed to failure before they were made—at hindering the inevitable revision of the political map of Europe on national lines; and in this futile endeavour there are two points of interest for our present purpose. The first point is that, from 1815 onwards, the new Western leaven of Nationalism was fermenting just as

vigorously among the Orthodox Christian peoples within and beyond the south-eastern frontiers of the Danubian Monarchy as it was among the Western peoples within and beyond the frontiers of the Monarchy on the western side. The second point is that when the Monarchy reconciled itself at last, under the discipline of hard experience, to the necessity of making some concessions to the spirit of the age, it duly succeeded in arriving at an accommodation with the national aspirations of the Western peoples. By renouncing the hegemony over Germany and the possession of territory in Italy in 1866, the Hapsburg Monarchy rendered possible its own coexistence with the new German Empire and with the new Italian Kingdom; and by accepting the Austro-Hungarian Ausgleich of 1867 and its Austrian corollary in Galicia, the Hapsburg Dynasty succeeded in identifying its own interests with the national interests of the Polish and the Magyar as well as the German element in its dominions. The problem which the Hapsburg Monarchy never succeeded in solving was the problem of Nationalism in the Balkans; and it was its inability to arrive at an accommodation in this quarter that eventually brought the Monarchy to destruction. The Western weapons of Nationalism, which had not dealt the Hapsburg Monarchy any mortal blow when they were wielded by the Italian and German and Magyar hands that had forged them, proved deadly in the alien hands of the Serbs. The discarded Danubian carapace of the Western body social, which had withstood so many blows from the Ottoman sabre, was eventually pierced and shattered by Serbian bayonets.

Since 1918, the south-eastern frontier of the Danubian Hapsburg Monarchy—a frontier which for a hundred and eighty years was one of the abiding landmarks in the political landscape of Europe—has been effaced by the establishment of two new national states—Jugoslavia and Greater Rumania—which are symbolic of the triumph of the new order. Each of these new states is a 'successor-state' both of the *ci-devant* Hapsburg Monarchy and of the *ci-devant* Ottoman Empire; and each of them unites within its newly drawn frontiers not only territories acquired from two different dynastic states, but also—under the sign of the Western principle of nationality—populations that have been nurtured, hitherto, by two different civilizations. This audacious experiment in political chemistry may succeed or fail; these synthetically produced nations may become organic unions or may disintegrate into their constituent elements; but the mere fact that the experiment is being made is conclusive evidence that the Hapsburg Monarchy and the Ottoman Empire are both defunct and that they have been destroyed simultaneously by an identic hostile force.

It is curious in the present 'post-war' age, as one's train crosses the railway-bridge over the Save, between Semlin and Belgrade, to reread the opening passage of Kinglake's *Eothen*. When, less than a century ago, the English traveller was ferried across the frontier-river from the Hapsburg to the Ottoman bank, he felt as though he were passing out of one world into another; and the Austrian hussar who escorted him to the ferry-boat took leave of him as solemnly as though he were Hermes Psychopompus committing a soul to Charon's barque on the River of Hades. To the uninitiated English observer and to the unsophisticated Austrian soldier alike, the gulf there fixed between 'West' and 'East' seemed as great in the post-Napoleonic age as it had ever been; but this was not the view of the anxious-minded Rhenish statesman who at that moment, from his cabinet in Vienna, was pulling the strings of European diplomacy like a human spider spinning a political web. Metternich knew well enough, by that time, that the ancient gulf had been bridged and the ancient barriers thrown down; he knew that the spiritual leaven of Nationalism had already been carried from the 'West' into the 'East' across the obsolete dividing line; and he knew that the political miasma which was arising from the fermentation of this Western leaven in Orthodox Christian souls was more difficult to exclude from the sacrosanct dominions of his Imperial Master than the Plague itself.

Already, Metternich had taken alarm at the outbreak of the Greek insurrection against Ottoman rule in 1821. Clear-sighted as he was according to his own lights, he had divined at once that this repudiation of the Ottoman Pādishāh's authority by a handful of his Orthodox Christian subjects in the remote Morea was a menace to the authority of the Austrian Kaiser because the Greeks were claiming Western sympathy and assistance for their cause in the name of the Western principle of Nationality. Metternich represented to the Holy Alliance insistently, though without success, that if their own principle of Legitimacy was to be maintained intact, the Greek insurgents must be boycotted as outlaws and Sultan Mahmūd be supported, in maintaining his dynastic rights, as one of the Lord's Anointed. From the Legitimist standpoint, Metternich's attitude on this occasion was entirely justified by the event. For the triumphant success of the Greek insurgents—a success which they owed to the friendly intervention of France, Great Britain, and Russia as much as to their own exertions—was an event of far more than local importance. The erection of a sovereign independent national Greek State in 1829-31 made it inevitable that every people in South-Eastern Europe should insist upon attaining its own national independence and national unity sooner

or later; and thus the Greek insurrection of 1821 incidentally preordained the erection of Yugoslavia and Greater Rumania in 1918-20. Truly, Metternich's senses had not deceived him when he heard the death-knell of the Danubian Hapsburg Monarchy in those reverberations from the clash of arms in the Morea which fell upon his ears in Vienna.

It is curious, too, in this present 'post-war' age, to compare the situation and the *éthos* of Austria with those of contemporary Turkey on the one hand and Bavaria on the other.

Out of the destruction which overtook the Hapsburg and the Ottoman Empire simultaneously in the General War of 1914-18, there have emerged an Austrian and a Turkish Republic; and these two republics bear a superficial resemblance to one another inasmuch as they both conform outwardly to the conventional type of modern parliamentary national state with which the Hapsburg and Ottoman empires remained fundamentally incompatible to the end of their histories. This formal resemblance, however, between the new Austria and the new Turkey is of little significance in the light of their profound present difference in *éthos*. The Austrians are at once the hardest hit and the least recalcitrant of the five peoples that have emerged from the War of 1914-18 on the losing side. They have accepted the new order passively, with supreme resignation as well as with supreme regret. By contrast, the Turks are the only people among the five who have taken up arms again, after the Armistice, against the victorious Powers and have successfully insisted upon negotiating their own peace-treaty freely and on a footing of equality with their late opponents, instead of having the victors' peace-terms imposed upon them. More than that, the Turks have seized upon the catastrophe of the Ottoman Empire as an opportunity for renewing their youth and changing their destiny. So far from accepting the new order passively, they have welcomed it with open arms, and have plunged into the path of Westernization, at the heels of their former subjects the Greeks and Serbs and Rumanians and Bulgars, with the zeal of eleventh-hour converts who are taking the Kingdom of Heaven by storm.

How are we to explain these strangely diverse psychological phenomena? Examination shows that this *éthos* in Turkish souls is something quite new. For more than five centuries—from the close of their dynamic age at the beginning of the fifteenth century of the Christian Era down to A.D. 1919—the Turks, in all the vicissitudes of their history, invariably displayed the psychological reactions of Conservatism. In the days of their prosperity, they waxed fat and kicked, like Jeshurun;¹ and in the days of their ad-

¹ Deuteronomy xxxii. 15.

versity they either stood stock still or behaved like sullen, thick-skinned mules who will not move until they are belaboured, and then not more than one step at a time.

The former ruling minority of Turkish landlords, who found themselves left stranded among alien minorities and under alien rule by the ebb of the Ottoman tide in Europe between 1683 and 1913, used to accept their sudden and extreme reversal of fortune as passively as the Austrians have accepted theirs since 1918. They would either abandon their ancestral lands and migrate *en masse* to squat and flit and squat again within the ever contracting Ottoman frontiers; or if they were too phlegmatic to make even this negative response to the new human challenge confronting them, and were restrained from migrating by sheer inertia, then they would resign themselves to sinking from the top to the bottom of the social ladder in their old homes under the new conditions. As for their fellows who continued to rule the Ottoman Empire, they could only be induced to 'Westernize' their institutions under *force majeure*, and then always piecemeal and to the minimum degree that seemed necessary at the moment in order to keep the Empire just alive. This stricture fairly applies to all the Ottoman 'Westernizers' from Sultan Selim III and Sultan Mahmūd II down to the Committee of Union and Progress inclusive, with one notable exception to prove the rule in the person of Midhat Pasha.¹ How, then, are we to explain the revolutionary change in the Turkish state of mind, from an ultra-Austrian passivity to an ultra-Jacobin activity, which has come to pass since 1919? And how, for that matter, are we to explain the converse change in the Austrian state of mind from the heroism of the defence of Vienna in 1682-3 to the 'defeatism' of the present day?

The explanation of both changes is to be found in the normal operation of Challenge-and-Response. The Viennese are showing, now, the cumulative psychological effects of having lived for more than two centuries as an 'imperial people' in the interior of the Hapsburg Dominions instead of sustaining their historic role as wardens of the marches of Western Christendom against the 'Osmanlis'. In their unstimulating latter-day environment, they learnt to feed out of the Dynasty's hand; and when the Imperial Government's ultimatum to Serbia had precipitated the General War of 1914-18, they obeyed the mobilization order, like sheep who follow their shepherd to the slaughter-house, with a blind faith in their Emperor Francis Joseph's assurance that, in doing what he had done, he had foreseen, and made provision for, all the eventualities that might befall his

¹ The process of 'Westernization' in the Ottoman Empire is examined in greater detail in IV. C (ii) (b) 2, vol. iv, pp. 76-8, as well as in Part IX, below.

trusty and well-beloved subjects. On the other hand, the Turks have responded, at this eleventh hour, to the challenge from the West—a challenge first presented by the triumphant defenders of Vienna in A.D. 1683—because, in 1919, they were simply unable to evade the issue any longer.

On the morrow of the Armistice of 1918, the Turks found themselves standing with their backs to the wall, in a situation in which they must either conquer or die. In this supreme hour, they were betrayed by the Ottoman Dynasty—a dynasty which had created not only the Ottoman Empire but the 'Osmanli Turks themselves, who were stamped, in the very name which they bore, with their creator's own image and superscription.¹ The Turks were forced by this betrayal to rely upon themselves—and this in a struggle for their existence. For in 1919–22 the Turks were no longer fighting in order to preserve an Ottoman province for their Pādishāh or a fragment of Dār-al-Islām for their Caliph. They were fighting to preserve their own homelands. The battle-field of In Önü, on which the decisive action in the Graeco-Turkish War of 1919–22 was fought, lies in that original patrimony on the north-western edge of the Anatolian Plateau which had been assigned to the fathers of the 'Osmanlis by the last of the Saljūqs more than six centuries back.² On the day of this decisive battle, the tide of Ottoman history, whose mighty flood had once spread from the neighbourhood of In Önü to the neighbourhood of Vienna, at length completed its mighty ebb by returning to its source. In this situation, the Ottoman Turkish people was faced with the momentous choice between two, and only two, alternatives: annihilation or metamorphosis. It will be seen that the final urgency of the challenge to which the Turks have responded has been fully sufficient to account for the potency of their eleventh-hour response. It will also be seen that the reversal in the direction of the pressure between the Western World and the main body of Orthodox Christendom—a reversal which first manifested itself under the walls of Vienna in A.D. 1683—has been followed in due course by a corresponding transfer of stimulus, which has manifested itself, in turn, in the situation and in the *éthos* of the two communities by whom the brunt of the pressure has been given and taken.

So much for the comparison between Austria and Turkey. As for the other comparison of Austria with Bavaria, the interest of this lies in the fact that Bavaria and Austria were originally of one substance. By origin, Austria is simply Bavaria's 'eastern march'—

¹ For the creation of the 'Osmanlis, see further Part III. A, vol. iii, pp. 22–44, below.

² See pp. 151–2, above.

or, rather, a cluster of Bavarian marches: Upper Austria, Lower Austria, and Steiermark or Styria—which was first evolved by the Bavarian body politic in order to protect its eastern flank against assaults from the Avars and Slovenes, and which afterwards became differentiated and consolidated, by a series of historical accidents, into a separate political entity. When we formulate the history of Austria in these genetic terms, we find ourselves enabled to measure once again, from a new angle, the extent of the change which has been produced in the Austrian *êthos* by the successive imposition and removal of external pressures.

During the last ten or twelve centuries, the country which began life as the eastern march of Bavaria has passed through a long series of experiences in which the Bavarian interior has had no share. Austria has been first stimulated by recurring waves of attack from Avars and Magyars and 'Osmanlis and then debilitated by the paternal despotism of the Hapsburgs; she has performed in turn the strangely different functions of carapace to a society in jeopardy and metropolitan province to a Great Power; and each phase in this varied and distinguished history has left some mark upon her, until the sum total has effaced her original Bavarian identity and has transformed her character, as well as her name, into something that is now entirely her own. During all this time, while the transfigured eastern march of Bavaria has been playing her great part in the life of our Western Society and in the life of the World, the Bavarian interior has remained one of those small countries which are 'happy in having no history'—as is signified in the fact that it has retained the original Bavarian name which Austria has discarded. During the ten or twelve centuries that have elapsed since Bavaria and Austria first parted company and began to go their different ways, the Bavarian *êthos* has remained parochial and exuberant and sanguine, whereas the Austrian *êthos* has become oecumenical and fastidious and sceptical. The contrast between the temperaments respectively prevalent in these two South German Catholic countries to-day cannot fail to strike the traveller who passes from one into the other at almost any point on their long common frontier; and it is not a contrast that can possibly be explained by any difference of racial endowment. There is no reason to suppose that, in the population of the original Bavaria, there was any difference of race between the Bavarians of the eastern marches and the Bavarians of the interior, nor is there any record of substantial changes in the racial composition of either population since their subsequent segregation into separate communities. The only tenable explanation—and it is a wholly adequate explanation—of the difference between the Bavarian and the

Austrian *êthos* at the present day is to be found in the operation of the psychological force of Challenge-and-Response.

In the Western World over against the Far Western Christendom

Having now surveyed such illustrations of Challenge-and-Response as are offered by the various historic responses to external pressures upon the continental European frontiers of Western Christendom, let us glance at three other frontiers of the same society: its land-frontier *vis-à-vis* the now extinct Far Western Christendom¹ in the *alter orbis* of Britain; its maritime frontier, *vis-à-vis* the abortive Scandinavian Civilization,² along the sea-boards of England and France upon the North Sea and the Channel; and its land-frontier *vis-à-vis* the Syriac Civilization in the Iberian Peninsula.

What has been the genesis of the present British 'United Kingdom'? It is a union of the two kingdoms of England and Scotland in Great Britain, together with the English and Scottish conquests and plantations in Ireland;³ and these two kingdoms, which cover the whole area of Great Britain between them, are the products of a struggle for existence between half a dozen 'successor-states' of the Roman Empire which were established, during the post-Hellenic *Völkerwanderung*, by Anglian and Jutish barbarians who migrated across the North Sea from the western coast of the continent to the eastern and southern coasts of the Roman island.⁴ An inquiry into the genesis of the United Kingdom thus resolves itself into the prior question: How is it that the struggle for existence between the primitive and ephemeral barbarian principalities of the so-called 'Heptarchy' in Great Britain has resulted in the emergence of these two progressive and enduring states-members of our Western Society? If we now glance at the historical process by which the two kingdoms of England and Scotland have eventually replaced 'the Heptarchy' on the political map, we shall find that the determining factor at every stage has been a response to some challenge which has been presented by the incidence of an external pressure.

The genesis of the Kingdom of Scotland can be traced back to

¹ This abortive Far Western Christian Civilization has been referred to, by anticipation, in I. B (iii), vol. 3, p. 29, above, and is dealt with further in II. D (vii), on pp. 322-40, below.

² See II. D (iii), pp. 86-100, above, and II. D (vii), pp. 340-60, below.

³ At the time of writing, some twelve years after the establishment of the Irish Free State, the United Kingdom still included an enclave of territory in Northern Ireland, where the Scottish plantations of the seventeenth century were most thickly sown, as a memorial of the fact that it once embraced the whole of the British Isles save for the Isle of Man, whose special status was a legacy from its Norwegian past.

⁴ This migration has been touched upon already, on pp. 86-100, above, apropos of the stimulus of migrations across the sea.

a challenge which was presented, some nine or ten centuries ago, to the outlying Anglian kingdom of Northumbria by the Picts and Scots, who were the representatives of the abortive Far Western Christian Civilization in an adjoining section of 'the Celtic Fringe'. The present capital of Scotland, Edinburgh, was founded by the Northumbrian prince whose name it bears¹ as the frontier-fortress of Northumbria over against the Picts; the political and cultural nucleus of medieval and modern Scotland has been the district called Lothian; and Lothian was originally the march of Northumbria against both the Picts beyond the Firth of Forth and the Britons in Strathclyde. The challenge was presented when the Picts and Scots conquered Edinburgh in A.D. 954 and thereafter compelled the principality of Northumbria to cede the whole of Lothian to them round about the turn of the tenth and eleventh centuries. This cession raised the following issue: Was this lost march of Northumbria, which had likewise been a march of Western Christendom, to retain its Western Christian culture in spite of the local change of political régime, or was it to succumb to the alien Far Western Christian culture of its Celtic conquerors? So far from succumbing, Lothian responded to the challenge by 'taking its conquerors captive'.

The culture of the conquered territory exercised such an attraction upon the Scottish kings that they made it the seat of their kingdom and came to feel and to behave as though Lothian were their ancestral homeland and as though their native Highlands were an outlying and alien part of their dominions. In consequence, by an historical paradox, the eastern seaboard of Scotland, from the northern shore of the Firth of Forth to the southern shore of the Moray Firth, was colonized, and 'the Highland Line' was pushed back steadily farther towards the north-west, by settlers of Anglian origin from Lothian under the auspices of rulers of Celtic origin and at the expense of a Celtic population who were the Scottish kings' original kinsmen and who had once conquered the Lowlanders under the leadership of these very kings' forefathers. By a consequential and not less paradoxical transference of nomenclature, 'the Scottish language' came to mean the Teutonic dialect spoken in Lothian, the *ci-devant* march of the Anglian principality of Northumbria, instead of meaning the Gaelic dialect spoken by the original Scots who had first brought the Scottish name into Britain in a migration from the north-west corner of Ireland to Argyll during the post-Hellenic Völkerwanderung.

Thus the ultimate result of the conquest of Lothian by the Scots

¹ This traditional etymology is challenged by J. A. Duke in *The Columban Church* (Oxford 1932, University Press), p. 13.

and Picts was not to set back the north-western boundary of Western Christendom from the Forth to the Tweed but to push the boundary forward until it embraced the whole north-western corner of the mainland of Britain. The new Kingdom of Scotland, which was brought into existence by the union of Lothian with the domain of the Scots and Picts in the Highlands, took the impress of the Western Christian culture which Lothian contributed to the common stock of the new Scottish body politic. Scotland became a member of the Western instead of the Far Western Christian Society; so that the conquest of Lothian by the Scots and Picts, which had first had all the appearance of being a redistribution of territory between Western and Far Western Christendom to the advantage of the latter at the former's expense, was actually turned to the advantage of Western Christendom by the triumphant response which Lothian made to the challenge thus presented to her. In virtue of this response, her transfer from Anglian to Scottish rule ultimately caused Western Christendom to increase and Far Western Christendom to decrease on this sector of their frontier in the British Isles.¹

Thus a conquered fragment of one of the principalities of the English 'Heptarchy' actually became the nucleus of one of the two commonwealths which have now come to divide between them the whole of Britain and to constitute by their union the present United Kingdom. This was an extraordinary feat; and it is pertinent to observe, once again, that the fragment of Northumbria

¹ The political union which brought the medieval and modern Kingdom of Scotland into existence towards the beginning of the eleventh century of the Christian Era has several points of symmetry with the union which brought into existence the Danubian Hapsburg Monarchy five centuries later. In the Scottish instance, Lothian plays the part that is played in the Danubian instance by Austria. Though it is the smallest of the component members of the union in mere territorial extent, it manages to dominate the rest by its superiority in culture and in political ability. Again, Edinburgh corresponds to Vienna. Either city finds its destiny in being the capital of a union between two states after having started life as the frontier-fortress of one of the two states against the other: Vienna as the frontier-fortress of Austria (or rather Bavaria) against Hungary, Edinburgh as the frontier-fortress of Lothian (or rather Northumbria) against the Picts. The symmetry extends even further; for the Danubian Hapsburg Monarchy sprang from the union not of two states but of three, and so did the Kingdom of Scotland likewise. If Lothian is the analogue of Austria and if the country of the Picts and Scots, north of the Forth-Clyde line, is the analogue of Hungary, we find that Bohemia has its counterpart in Strathclyde. By comparison with these substantial correspondences, it is not a material point of difference that the dynasty which brought about the Danubian union originated in Austria, whereas the dynasty which brought about the North British union originated not in Lothian—the analogue of Austria—but in the domain of the Picts and Scots, which is the analogue of Hungary. It was only an accident that the Danubian Monarchy was not brought into existence by the Hungarian conquest of Austria in A.D. 1485. If Matthias Corvinus's anticipation of Ferdinand Hapsburg's achievement had lasted not merely half a dozen years but four centuries—as it well might have lasted—and had so precluded an Austrian ruler from performing the achievement with enduring success forty years later, as it was actually performed by Ferdinand, then the Danubian Monarchy would have come to be known as 'the Hungarian Empire' and not as 'the Austrian Empire'. In that event, the symmetry between the political structures of the Danubian Monarchy and the Kingdom of Scotland would have been complete down to the very nomenclature.

which performed this feat was the march between Forth and Tweed and not the interior between Tweed or Tyne or Tees and Humber.

If some enlightened traveller from Constantinople or Cordova had visited Northumbria in the tenth or eleventh century of the Christian Era, on the eve of the cession of Lothian to the Scots and Picts, he would assuredly have pronounced that Lothian had no future, and that, if any Northumbrian town was to become the capital of a great country, the town marked out for this destiny was not Edinburgh but York. Here was a city situated at the mid-point of the largest and richest arable plain that was to be found in the whole northern half of the island of Britain; a city which had once been a *point d'appui* of the Roman Empire and had now become a *point d'appui* of the Roman Church. Already, for a moment at the turn of the ninth and tenth centuries, York had bade fair to become the capital of a great kingdom—not indeed, as a state-member of Western Christendom, but as an important structural element in the rising edifice of the Scandinavian World which was then threatening to drive Western Christendom to the wall and to usurp its place.¹ Yet this Scandinavian Kingdom of York rose and fell as swiftly as some solid-seeming mountain of thick-piled cloud which dissolves into wisps before the eyes of the astonished gazer. By the year A.D. 920, the Danish Kingdom of York, as well as the surviving remnant of English Northumbria north of Tees, had submitted to the suzerainty of the English King of Wessex; and, through all the subsequent vicissitudes of Danish and Norman conquest, Yorkshire came to be welded more and more closely into the fabric of the new Kingdom of England. Nothing but the abnormal size of Yorkshire among the counties of England and Scotland to-day remains to recall the fact that York once aspired to be the capital not of a county but of a kingdom. This aspiration came to naught in the collapse of the abortive Scandinavian Civilization which had momentarily translated it into a reality. In A.D. 920, when King Ragnvald of York acknowledged the suzerainty of King Edward of Wessex, York lost her prospect of becoming the capital of a kingdom thirty-five years before Edinburgh was assured of this prospect through being conquered from her Northumbrian founders by the Picts and Scots in A.D. 955.

The Northumbrian city which came nearest to emulating Edinburgh's political eminence was not York but Durham; and Durham became eminent by inheriting from Lothian the role of northern march against the Scots after the incorporation of Lothian

¹ For the conflict between Western Christendom and the abortive Scandinavian Civilization, see II. D (vii), pp. 340-60, below.

itself into Scotland. As the county palatine of the medieval Kingdom of England *vis-à-vis* the medieval Kingdom of Scotland, Durham acquired something of the status of an independent state and her prince-bishop some of the attributes of a sovereign.

In the Western World over against Scandinavia

In the foregoing analysis of the differentiation between the respective fortunes of several parts of the early English principality of Northumbria, we have just had occasion to notice certain incidents in the Scandinavian impact upon Western Christendom. This Scandinavian impact was the other external pressure, over and above the pressure from the Far Western Christians of 'the Celtic fringe', which went to the making of the Kingdom of Scotland; and it also went to the making of the kingdoms of England and France likewise.

In the making of Scotland, the union between Lothian and the domain of the Picts and Scots was not the first stage. By the time when the Picts and Scots conquered Lothian, they were already united with one another; but this union was not of old standing. Before the *Völkerwanderung* that followed the break-up of the Roman Empire, the Picts had had the northern extremity of Britain to themselves. During the *Völkerwanderung* the Scots had migrated across the sea from Ireland and had settled in Argyll as hostile intruders on Pictish ground.¹ The hostility between the two peoples had only given place to a friendly political union between them in A.D. 843. What was the cause of this remarkable change in their relations? The date speaks for itself. The Picto-Scottish union was effected one year after the first Viking raid on London and two years before the first Viking raid on Paris; and while some of the Scandinavian sea-raiders were sailing down the North Sea into the English Channel, others had been finding their way round the north-west coasts of Britain into Ireland. Thus the date of the Picto-Scottish union seems to tell its own tale; and we may hazard the conjecture that the two peoples who before the advent of the Vikings had been contending with one another for possession of the northern extremity of Britain, now brought themselves to compose their feud and unite their forces in response to the challenge of this formidable new pressure which had suddenly descended upon both alike from Scandinavia.

If this conjecture is right, the genesis of the Kingdom of Scotland may be expressed in terms of the responses to two successive challenges: first, a Picto-Scottish response to a Scandinavian challenge, and, second, a response on the part of the Northumbrian

¹ See II. D (iii), p. 86, above, and II. D (vii), pp. 323-4, below.

frontiersmen in the march of Lothian to a challenge from the united Picts and Scots.

In the genesis of the Kingdom of England we can discern the operation of responses to the same two challenges, but we find that the challenges were delivered here in the inverse chronological order. In this case, the first pressure—corresponding chronologically to the impact of the Scandinavians upon the Picts and Scots—was the pressure of certain sections of 'the Celtic Fringe' upon the English principalities of 'the Heptarchy'; the second pressure—corresponding chronologically to the Picto-Scottish conquest of Lothian—was the impact of the Scandinavians upon the two English principalities which had previously marked themselves out as the two alternative candidates for the hegemony of Southern Britain by their respective responses to the challenge of Celtic pressure upon the western borders of the English settlements in the island.

Just as, in North Britain, it was not Yorkshire in the interior of the principality of Northumbria but Lothian on the local border of 'the Celtic Fringe' that became the nucleus of an enduring kingdom, so, in South Britain, this destiny did not await the principality of Kent, in the corner of the island which lay nearest to the focus of the Western Christian Civilization on the Continent, nor again the principality of Essex, just across the estuary of the Thames. Thanks to its geographical situation, Kent did indeed become the first *point d'appui* of the Roman Church in Britain, as York became the second. Yet the very geographical circumstances which told in favour of Canterbury and York becoming archbishops' sees at the same time militated against their becoming the capitals of kingdoms. On the political plane, Canterbury never rose to be anything more than the capital of the principality of Kent. Political power in South Britain accrued not to Kent and Essex in the interior, at the point of junction between the insular outpost of Western Christendom and its continental main body, but to Mercia and Wessex, the two English principalities which were 'up against' the two southerly sectors of 'the Celtic Fringe' on the main island of the British Archipelago.

Moreover, the relative strength of Mercia and Wessex, in the first phase of their histories, showed itself proportionate to the relative strength of the external pressure from 'the Celtic Fringe' to which these two English principalities were subject. The pressure exerted upon Mercia from Wales was stronger than that exerted upon Wessex from the Welsh communities south of the Bristol Channel. Though the resistance of these 'West Welsh' to the English invaders has left an undying echo in the legend of King

Arthur, this resistance seems nevertheless to have been overcome with comparative ease and rapidity. The Arthurian legend ends on a note of heroic disaster; and the front line of the 'West Welsh' defences, which the legend locates in the neighbourhood of Glastonbury, was driven back by the founders of the English border principality of Wessex, advancing up the Valley of the River Thames, from the western watershed of the Thames to the distant line of the River Tamar which now constitutes the boundary between the counties of Devon and Cornwall. Confined, as they thus were, to a by no means impregnable patch of territory in the extreme south-western corner of the island, the 'West Welsh' ceased to be formidable to the English principality of Wessex, whereas the Welsh of Wales, from their relatively extensive and defensible mountain fastnesses, continued to press upon the western frontier of the adjoining English principality of Mercia.

The severity of this pressure is attested philologically by the name Mercia itself ('The March' *par excellence*) and archaeologically by the vestiges of the great earthwork called 'Offa's Dyke' which once covered the Welsh frontier of Mercia from the estuary of the Severn to the estuary of the Dee; and the military and political energy generated in Mercia, in response to this external pressure, enabled this same Mercian King Offa, when he turned his arms from the frontier towards the interior, to come within an ace of establishing a Mercian hegemony over South Britain. At the time when Mercia was stimulated, by her reaction to the pressure from Wales, into indulging these great ambitions, Wessex was prompted, by the less powerful stimulus from her 'West Welsh' frontier, to achieve, in the interior, the less ambitious feat of absorbing Kent and Essex into her body politic. Thus, in the eighth century of the Christian Era, it looked as though Mercia rather than Wessex were marked out, by the greater energy of her response to the pressure from 'the Celtic Fringe', as the destined nucleus of a future Kingdom of England. In the ninth century, however, when the challenge from 'the Celtic Fringe' was eclipsed by the challenge from Scandinavia, these prospects were falsified. In face of this new challenge, Mercia forfeited her prospects of greatness by failing to respond this time,¹ while Wessex, under the leadership and inspiration of Alfred, responded triumphantly and thereby became the nucleus of the historic Kingdom of England as it exists at the present day.

The Scandinavian pressure upon the Oceanic (as contrasted with the Mediterranean) seaboard of Western Christendom evoked

¹ Before the close of the eighth century, Mercia had sapped her own strength by succumbing to the malady of Militarism (see IV. C (iii) (c) 3 (α), vol. iv, p. 501, below).

responses which resulted not only in the coalescence of the Kingdom of England out of the insular 'Heptarchy', but also in the articulation of the Kingdom of France out of the continental mass of Western Christendom which had once been embraced in Charlemagne's Empire.

We have already observed that, in the tenth century, 'the Holy Roman Empire' passed from the Carolingian Dynasty to the Ottonids; and we have explained¹ this transfer of power by the circumstance that, as a result of Charlemagne's conquest of Saxony, the stimulus of serving as the march of Western Christendom against the continental European barbarians had been inherited by conquered Saxony from her conqueror Austrasia. We may now consider the notorious historical fact that, when the Ottonids succeeded the Carolingians in the Imperial office, they did not enter into the whole of the Carolingian territorial inheritance. Of the three portions into which the Carolingian dominions had been partitioned in A.D. 843,² only the eastern and the central portion were reunited, rather more than a century later, under the rule of Otto I (*imperator* A.D. 962-73).³ In the western portion, the Carolingians were succeeded, not by the Ottonids but by the Capetians (in A.D. 987);⁴ and this change of dynasty was the outward visible sign of an inward psychological change which was the genesis of 'France' in the present meaning of the name. The West Frankish crown became the French crown when it was transferred from the head of the last Carolingian at Laon to Hugh Capet's head at Rheims. Out of the old undifferentiated substance of the Carolingian Empire there had emerged, in the west, a new kingdom which thenceforward was not only recognized juridically as being independent of 'the Holy Roman Empire' but was also felt to be a distinct body politic, within the larger but more rudimentary body social of Western Christendom, in the consciousness of the French people themselves. In fact, the birth of France in the tenth century of the Christian Era was the first—and has ever remained one of the most definite—of those inner geographical articulations of our Western Society which in our day have been carried to extremes in the name of 'the principle of nationality'.

Why was it that, when 'the Holy Roman Empire' was rescued from disintegration by the Ottonids, it failed to reunite the western portion of the Carolingian Empire with the central and the eastern

¹ See pp. 167-8, above.

² See I. B (iv), vol. i, p. 37, above.

³ Otto became German king (i.e. ruler of the easternmost of the three portions into which the heritage of Charlemagne had been partitioned in A.D. 843) in A.D. 936, twenty-six years before he assumed the Imperial title. The claim, implicit in this assumption, to sovereignty over the entire Carolingian heritage was never, of course, made good either by Otto or by his successors.

⁴ The date of Hugh Capet's coronation at Rheims.

portion under its aegis? We have remarked above that the defence and extension of the continental European frontiers of Western Christendom was the original function of 'the Holy Roman Empire' and continued to be its function—in face of diverse pressures from barbarians and from alien civilizations—through all its subsequent metamorphoses. Thus the secession of France from 'the Empire' was not due to any failure, on 'the Empire's' part, to perform its own special duty. The emergence of the Kingdom of France, like that of the Kingdom of England, in the tenth century is rather to be explained as the response to a new external pressure upon a different frontier of Western Christendom: the Scandinavian pressure upon the Atlantic seaboard. From the continental pressures which it was 'the Holy Roman Empire's' task to meet, Britain was exempt by nature and Gaul by circumstance after Charlemagne had carried the continental frontier of Western Christendom forward from the right bank of the Rhine to the left bank of the Elbe. On the other hand, the impact of the Vikings subjected Western Christendom to a maritime pressure from which the central and eastern portions of the Carolingian dominions were exempt, but which fell with its full weight upon the western portion—that is, upon Western Gaul—together with Britain. The line of the original frontier between France and 'the Empire'—a frontier which bisected ancient Gaul longitudinally from the mouth of the Scheldt to the mouth of the Rhône—is explicable as the line along which, in the ninth and tenth centuries of the Christian Era, there was a substantial equilibrium between two simultaneous external pressures. East of this line, the continental pressure from Slavs and Nomads was still felt more severely than any other, while west of the same line this continental pressure was exceeded by the maritime pressure from the Vikings—a pressure which overbore all others in its zone of heaviest incidence within range of the Atlantic coast and up the navigable channels of the rivers which gave the Viking ships an entry from the coast into the interior.

The local responses to the maritime challenge from Scandinavia which were made by the Western Christian Society on the Atlantic slope of the European Continent and in the British Archipelago were literally the making of France and England as we know them to-day.¹ These responses not only brought the two kingdoms into

¹ In the subsequent course of Western history, the making of France and England was completed by the mutual pressure which the two kingdoms exerted in turn upon one another. In particular, the grinding pressure to which France was subjected by England in the last phase of 'the Hundred Years' War' evoked the tremendous French response which was inspired by and incarnated in Joan of Arc. The military energy generated by this French reaction against English aggression was so powerful that, after it had driven the English into the sea, sufficient impetus remained to carry French arms—in the opposite direction—right over the Alps and down the Italian Peninsula before the close of the fifteenth century. The work which the Vikings had begun and the

existence but determined their centres of gravity and assigned them their historic capitals. The Kingdom of England coalesced, not round Mercia, which failed to respond to the Scandinavian challenge, but round Wessex, which rose to the occasion. The old capital of Wessex, however, did not become the capital of the new English Kingdom; for Winchester, which had once lain within range of the frontier of Wessex over against the 'West Welsh', did not lie in the principal danger-zone in the struggle between the English and the Danes. In the Danish ordeal, Winchester enjoyed a comparative security for which it had afterwards to pay by an irreparable loss of prestige and power. When Wessex had mastered the Danes and had grown into England in the process of performing the feat, the capital of the new kingdom soon passed from Winchester, in the inglorious interior, to London, the city which had borne the heat and burden of the day and which had perhaps given the long battle its decisive turn in A.D. 895 by repelling the attempt of a Danish Armada to ascend the Thames. Similarly, the Kingdom of France found its centre of gravity, not in Provence or Languedoc, whose Mediterranean coastline was rarely visited by Viking raiders, but in the *Langue d'Oil*, which felt the full force of the storm from Scandinavia. Again, within the area of the *Langue d'Oil*, the capital passed away from Carolingian Laon—a city set safely on a hill overlooking the sources of the Oise, far above the highest point up to which the river was navigable for Viking craft. The inevitable capital of the new French Kingdom was Paris in the *Île de France*, a city which had stood in the breach and had brought the Vikings to a halt in their ascent of the Seine as London had brought them to a halt in their ascent of the Thames.¹

Thus the response of Western Christendom to the Scandinavian maritime challenge manifested itself in a new Kingdom of France with its capital at Paris, as well as in a new Kingdom of England with its capital at London; and at the same time it is to be observed that these manifestations of new creative power on the face of the political map, imposing though they are, do not reveal the actual vigour and versatility of the response in its full measure. In order to take its measure, we must add that, in the process of gaining the upper hand over their Scandinavian adversaries, the French and English peoples forged the potent military and social instrument of the Feudal System, and that they also gave aesthetic expression to the emotional experience of the ordeal in national epics.

English King Henry V continued was consummated by all the neighbours of France in unison when they fell upon Revolutionary France in 1792, and provoked an eruption of national energy which astonished the World.

¹ For details of the rise of Paris and London through their heroic responses to the Scandinavian challenge, see the Annex to the present chapter, pp. 400-1, below.

The English national Epic is represented by one notable work of art: the *Lay of the Battle of Maldon*. The French Epic, which is represented by the *Chanson de Roland* and the other *Chansons de Geste*, is the stem from which has sprung the mighty tree of our Western vernacular literature: a literature which has branched into an infinite variety of *genres* and which has learnt to operate with as many tongues as there are living languages in Western Christendom.¹

With regard to the origins of the Feudal System, it will suffice to quote the following account of its emergence in England, before the Norman Conquest, from the work of a scholar who is one of the acknowledged masters of the subject:

'It became impossible to perform the ordinary *fyrð* service, in frequent expeditions and in proper equipment, on the basis of a tenement of one hide, without help from outside. The coat of mail and the horse acquired more and more value from a military point of view—one as a means of defence in the hard struggles with the Danes, the other as a means of quick locomotion. Well-forged helmets and swords were scarce and very expensive. Altogether, the difference between a well-armed warrior and a militiaman grew more and more important. This led ultimately to the formation of a professional force of knights and sergeants-at-arms. . . .

'The outfit of 1066 was more elaborate and costly than that of 800. Although horses were employed in Charlemagne's armies, especially in his *scaræ* or picked troops, the decisive turn towards horsemanship was taken in the Danish wars, when the "horsed" Vikings had to be caught up and pursued by riding divisions, and the five-hide unit probably included provision for one or two horses. . . . The social foundation of the old army establishment—the status of the small free householder, provided on the average with a hide—was entirely inadequate to meet the altered requirements of the art of war and of military organisation. A unit five times as large grew up as the natural basis for the man-at-arms in the national array of the tenth and eleventh centuries. One might say—using political expressions with some caution—that the more ancient democratic arrangement had to be replaced by an aristocratic one.'²

¹ The author of the *Lay of Maldon* has derived his technique and style from the tradition of *Beowulf*, but his inspiration has quite a different source and character. The older epic poetry in the English tongue was inspired by the experience of barbarians who were overrunning the Roman Empire in the *Völkerwanderung* which occupied the interregnum between the submergence of the Hellenic Civilization and the emergence of the 'affiliated' Western Civilization. The *Lay of Maldon* is part of a response which was made by this Western Civilization, after its emergence, to one of the first great challenges with which it was confronted. Whereas *Beowulf* is an expression of barbarism on the war-path, the *Lay of Maldon* is the expression of a civilization fighting for its life. Thus, genetically, the true affinity of the *Lay of Maldon* is not with the previous English epic poetry but with the contemporary French epic poetry which was evoked in an adjoining province of Western Christendom by the same ordeal of the impact of the Vikings. The *Lay of Maldon* and the *Chansons de Geste*, between them, are the outcome, in the artistic sphere, of the collision between Western Christendom and the abortive Scandinavian Civilization in one of the two opposing camps. In the other camp, the outcome in the same sphere is the Icelandic Saga. (For the part played in the genesis of the Icelandic Saga by the stimulus of transmarine migration, see II. D (iii), pp. 86–100, above.)

² Vinogradoff, Paul: *English Society in the Eleventh Century* (Oxford 1908, Clarendon Press), pp. 30 and 34.

Thus the Feudal System, like the *Lay of Maldon* and the *Chanson de Roland*, and like the kingdoms of England and France with their new capitals in London and Paris, was an outcome of the reaction of Western Christendom to Scandinavian pressure upon her Atlantic seaboard; and these manifold creations testify to the versatility and the vigour of the Western response which the Scandinavian challenge evoked. The most cogent testimony of all is afforded by the actual outcome of the collision between Western Christendom and its Scandinavian adversaries. Western Christendom successfully defended herself, by force of arms, against the first fury of the Scandinavian onslaught which had threatened to overwhelm her; she then passed over to the offensive by rapidly converting to her religion and culture the invaders who had made a forcible lodgement on her soil in the Danelaw and in Normandy; and she reaped the fruits of this moral victory when she sent forth the converted Normans, as her knights errant, to fight in her service not less valiantly, and at the same time far more effectively, than their pagan ancestors had fought against her.

Little more than a century after Rollo and his companions had made with Charles the Simple the pact which secured them a permanent settlement on the Atlantic seaboard of France as newly initiated members of the Western Christian fraternity, their descendants were extending the bounds of Western Christendom in the Mediterranean at the expense of Orthodox Christendom and Islam, and were spreading the full light of the Western Civilization, as it now shone on the Continent in France, into the insular kingdoms of England and Scotland which still lay in the penumbra. Physiologically, the Norman Conquest of England might perhaps be regarded as the final achievement of an enterprise which adventurers of Scandinavian blood had been perpetually striving to accomplish for more than two centuries. From the cultural standpoint, however, this interpretation of the Norman Conquest makes nonsense; for the Normans came to England in the eleventh century on a mission which was the very contrary of the Danish mission in the ninth century. The Normans repudiated their Scandinavian pagan past by coming, not to destroy the law of Western Christendom in England, but to fulfil it. On the field of Senlac, when the Norman warrior-minstrel Taillefer rode singing into battle in the van of the Norman knights, the language on his lips was not Norse but French, and the matter of which he was inditing was not the tale of Sigurd but the tale of Roland. When the Western Christian Civilization had thus captivated the Scandinavian invaders of its own domain, it is no wonder that it was able to set the seal upon its victory by supplanting the abortive Scandinavian Civilization in

Scandinavia itself and in the uttermost parts of the Earth to which Scandinavian seafarers had penetrated. We shall have occasion to examine this impact of the Western Christian Civilization upon Scandinavia and Iceland and Greenland at a later point in this volume, when we shall be considering the collision between Christendom and the abortive Scandinavian Civilization from the Scandinavian standpoint.¹

In the Western World over against the Syriac World in the Iberian Peninsula

The last frontier of Western Christendom that calls for consideration here is the land-frontier in the Iberian Peninsula *vis-à-vis* the Syriac Society in its latest phase—a phase which began when the Arabs reintegrated the Syriac universal state in the seventh century of the Christian Era. In the history of this frontier there are two outstanding features. In the first place, Western Christendom came under pressure from an alien civilization at a far earlier stage in this quarter than in any other. In the second place, the Powers which came into being, in response to this pressure, on the Iberian marches of Western Christendom eventually came to play a leading role, which was all their own, in the propagation of the Western Civilization.

As regards the first of these two points, we have seen that on the North European continental land-frontier Western Christendom was confronted at the outset solely by barbarians. In that quarter, the Western World did not become subject to pressure from the main body of Orthodox Christendom before the Ottoman impact upon Hungary in the fifteenth century of the Christian Era,² while it was not until the sixteenth century that the Russian offshoot of Orthodox Christendom exerted pressure upon the West in the form of a Muscovite impact upon Lithuania.³ On the other hand, on the Iberian land-frontier, Western Christendom found itself under pressure from the Syriac Civilization at the dawn of Western history. Indeed, this Syriac menace to the existence of Western Christendom in its infancy was still more formidable than the contemporary menace from the North European barbarians;⁴ and our Western Society was awakened to its first glimmer of self-consciousness by the ordeal of wrestling simultaneously with these two deadly foes—like the infant Hēraklēs when he rose in his cradle to wrestle with the two serpents that had been sent by a malevolent

¹ See II. D (vii), pp. 340–60, below.

² See pp. 177–9, above.

³ See pp. 175–6, above.

⁴ See the passage cited in I. B (iii), vol. i, p. 30, footnote 1, above, from Edward Gibbon: *The History of the Decline and Fall of the Roman Empire*, ch. xlii.

goddess to take his life, and saved himself alive by strangling both monsters, each single-handed.

The Arab onslaught upon the infant civilization of the West was an incident in the final Syriac reaction against the long Hellenic intrusion upon the Syriac domain; for when the Arabs, in the strength of Islam, took up and completed the task which had proved to be beyond the strength of Zoroastrians and Jews and Nestorians and Monophysites, they did not rest until they had recovered for the Syriac Society the whole of its former domain at its widest extension. Not content with reconstituting as an Arab Empire the Syriac universal state which had originally been embodied in the Persian Empire of the Achaemenidae, the Arabs went on to reconquer the ancient Phoenician colonial domain in the Western Mediterranean which, in the Achaemenian age, had been welded into a unity of its own—an overseas counterpart of the Persian Empire—under the hegemony of Carthage. For a moment in the eighth century of the Christian Era an Arab Caliph fulfilled the ambition which a Persian King of Kings had found himself unable to fulfil in the sixth century B.C.¹ The last Umayyad who reigned at Damascus was at least nominally master of the whole compass of the Syriac World, from the farthest limits ever attained by the Achaemenian Empire in the east to the farthest attained by the Carthaginian Empire in the west.² In the latter direction, the Arab commanders had crossed not only the straits of Gibraltar but the Pyrenees in the footsteps of Hannibal in A.D. 713; and thereafter, though they had not emulated their great Carthaginian predecessor's passage of the Rhône and the Alps, they had broken ground which Hannibal never trod when they carried their arms to the Loire in A.D. 732. At the Battle of Tours, the Arabs were attacking Western Christendom in its cradle.

The discomfiture of the Arabs by the Franks on this occasion has assuredly been one of the decisive events in history; for the Western

¹ According to Herodotus, Cambyses, after his conquest of Egypt, aspired to round off the Achaemenian Empire in North Africa by conquering the Napatan Kingdom up the Nile and the oases of the Libyan Desert and the Carthaginian Empire beyond the Syrtes. Operations against Napata and the Oasis of Ammon were actually attempted with disastrous results. Simultaneously, Cambyses 'ordered the fleet to sail against Carthage; but the Phoenicians declined to carry the order out. They explained that they were bound to the Carthaginians by solemn pledges, and that they would be committing an atrocity if they made war upon their own colonists. The Phoenicians' refusal was decisive, since the remainder of the fleet by itself was no match for the Carthaginian forces. Accordingly, the Carthaginians escaped the Persian yoke; for Cambyses shrank from coercing the Phoenicians, who had become members of the Persian Empire of their own free will and were the mainstay of the Persian Navy.' (Herodotus: Book III, ch. 19.)

² On the eastern front, the Oxus-Jaxartes Basin was definitively incorporated into the Arab Empire in the years A.D. 737-41 (see p. 141, with footnote 3, above) by Nasr, while on the western front Musa had completed the Arab conquest of the Visigothic 'successor-state' of the Roman Empire as early as A.D. 713 by occupying the Transpyrenean province of Septimania along the Gallic coast between the Pyrenees and the Rhône.

reaction to Syriac pressure which declared itself on the battle-field of Tours in A.D. 732 continued in force and increased in momentum on this front until, some eight centuries later, its impetus was carrying the Portuguese vanguard of Western Christendom right out of the Iberian Peninsula and onward overseas round Africa to Goa and Malacca and Macao, and the Castilian vanguard onward across the Atlantic to Mexico and thence across the Pacific to Manila.¹ These Iberian pioneers of Western Christendom performed an unparalleled service for the civilization which they represented. They expanded the horizon, and thereby potentially the domain, of our Western Society from an obscure corner of the Old World until it came to embrace all the habitable lands and navigable seas on the surface of the planet. It is owing to this Iberian energy and enterprise that Western Christendom has grown, like the grain of mustard seed in the parable,² until it has become 'the Great Society': a tree in whose branches all the nations of the Earth have come and lodged. This latter-day Westernized World is the peculiar achievement of Western Christendom's Iberian pioneers; and the Western energy which performed this feat was evoked and sustained and wrought up to its high intensity by the challenge of Syriac pressure on the Iberian front.

The Portuguese and Castilian seafarers who made their presence felt throughout the World in the first century of our modern age (*circa* A.D. 1475-1575) were the heirs of frontiersmen whose spirit had been tempered by thirty generations of strenuous border warfare against the Moors on the Iberian marches. On this frontier, the Franks first turned back the tide of Arab conquest from the heart of Gaul; thereafter, under Charlemagne's leadership, they carried their counter-offensive to the Iberian side of the Pyrenees, where they joined forces with the remnant of the Visigoths in the fastness of Asturia; and eventually, during the post-Syriac interregnum (*circa* A.D. 975-1275), when the Umayyad Caliphate in Andalusia broke up,³ these Christian barbarians of the Pyrenaean hinterland contended victoriously for the possession of the Umayyads' Peninsular heritage with the Muslim Berbers from the opposite hinterlands in Africa: the wild Murābit Nomads from the Sahara and the still wilder Muwāhhid highlanders from the Atlas.

The dependence of Iberian Christian energy upon the stimulus administered by pressure from the Moors is demonstrated by the fact that this energy gave out as soon as the Moorish pressure

¹ The expansion of Frankdom in this direction has been mentioned by anticipation in I. B (iv), vol. i, p. 38, above.

² Matthew xiii. 31-2; Mark iv. 31-2; Luke xiii. 19.

³ When the Umayyad Caliphs who had ruled the whole Syriac World from Damascus were overthrown in A.D. 750 by the 'Abbasids, a branch of the Umayyad House succeeded in establishing itself in Andalusia, where it ruled at Cordova from A.D. 755 to 1028.

ceased to be exerted. In the seventeenth century of the Christian Era the Portuguese and Castilians were supplanted in the new world which they had called into existence overseas by interlopers from the Transpyrenaeen parts of Western Christendom—the Dutch and the English and the French—and this discomfiture overseas coincided in date with the removal of the historic stimulus at home through the extirpation (by massacre, expulsion, or forcible conversion) of the remaining 'Moriscos' in the Peninsula.

Again, if we look farther back, we shall observe that Portugal and Castile were only two out of the three Christian 'successor-states' of the Umayyad Caliphate which had divided the Iberian Peninsula between them. Why did not Aragon take her part, side by side with Castile and Portugal, in the vaster enterprises of discovery and commerce and conquest on which the two sister kingdoms embarked at the turn of the fifteenth and the sixteenth century? In the immediate past, during the later 'Middle Ages', Aragon had played a more brilliant role than either Castile or Portugal in the life of the Western Society. She had shared in the brilliance of the North Italian city-states and had made certain original contributions of her own—in the fields of cartography and of international law—to the North Italian medieval culture. Why was it, then, that, just when Portugal and Castile both entered upon the brilliant phase of their careers, Aragon allowed herself to be dominated and effaced by her Castilian neighbour?¹ The explanation perhaps lies in the fact that the stimulus of Moorish pressure had been lost by Aragon several centuries before it was lost by either of the other two Peninsular kingdoms. In the days of da Gama and Columbus, both Portugal and Castile were still serving as marches of Western Christendom against the Moors. Castile then still marched in the Peninsula with the surviving Moorish kingdom of Granada, while Portugal marched with Morocco in her Tangerine province on the African side of the Straits of Gibraltar; and the Portuguese and Castilian exploits overseas, which began in that age, were simply diversions, to a new and wider field, of energies which had hitherto been employed assiduously against the Moors at home. On the

¹ The Aragonese themselves submitted passively to 'Castilianization'; the Catalans, who had been the active and progressive element in the medieval Kingdom of Aragon, kicked against the pricks. Yet this Catalan resistance to Castilian domination has been feeble and ineffective compared with the Portuguese. The Crown of Portugal was united with the Crown of Castile in A.D. 1581, only 102 years after the Catalans had been yoked with the Castilians by the union of the Crowns of Castile and Aragon which came about in 1479 through the marriage of Ferdinand and Isabella ten years earlier. The sequels to these two unions were very different. The Portuguese revolted against the Castilian yoke in 1640 and compelled the Government at Madrid to recognize the independence of Portugal in 1663. On the other hand, the Catalans failed in their belated attempt to recover their independence from Madrid during the War of the Spanish Succession, with the result that Catalonia disappeared altogether off the political map from the fall of Barcelona in 1714 down to the Spanish Revolution of 1931.

other hand, Aragon had been relegated to the interior of Western Christendom since A.D. 1235, when the overthrow of the Muwahhid Berbers by the Iberian Christians at the Battle of Las Navas had confined the Moors in the Peninsula to the Granadan enclave. Since that time, Aragon had been insulated from the Moors on land by the intervening Castilian province of Murcia, while in the Mediterranean her Moorish warfare had been brought to an end in A.D. 1229-32 by her conquest of the Balearic Islands.¹ Thus the stimulus which was the common source of Iberian Christian energies had ceased to play upon the Aragonese at least two-and-a-half centuries before it ceased to play upon their Castilian and Portuguese neighbours; and this may partly² explain why it was that Aragon fell out of the running before the great opportunity of overseas expansion offered itself to the Peninsular Powers, while Castile and Portugal did not finally succeed in cutting off the source of their own energies by extirpating the 'Moriscos' in their midst until the stimulus of Moorish pressure at home had carried the Portuguese and Castilian pioneers to the four corners of the World.

It will be seen that the relation of the Iberian marches of Western Christendom to the Moors resembles the relation of the Danubian Hapsburg Monarchy to the 'Osmanlis'.³ The Peninsular Powers, likewise, had their *raison d'être* in serving as marches of the Western Society against an alien civilization; and their energies were responses to the pressure of this alien force. They were vigorous just so long as this pressure was formidable, and as soon as the pressure slackened they petered out.

In the Andean and Central American Worlds

We may conclude our present survey of the stimulus of pressures by making the historic passage from the Iberian Peninsula to 'the New World'. When the Spaniards broke in upon the Andean and Central American worlds in the sixteenth century of the Christian Era, they found the Andean Society already in a universal state and the Mexic Society on the point of falling into one. The Andean universal state had been established by the Incas of Cuzco;

¹ This conquest was not, of course, the end of Aragonese enterprise in the Mediterranean; for the Balearic Islands were stepping-stones to Sardinia and the Two Sicilies, and these to Greece; and, by the beginning of the fourteenth century, Catalan adventurers were harrying both their Latin predecessors and these predecessors' Greek victims on the shores of the Aegean. Yet these latter-day Catalan filibustering expeditions into the Levant were no substitute for the ancient border warfare with the Moors at close quarters. The Catalan victories in the fourteenth century over Greek East Roman Emperors and Burgundian Dukes of Athens were as facile, and therefore as barren of stimulus, as the Castilian victories in the sixteenth century over Aztecs and Incas.

² Some part of the explanation evidently lies in the fact that Aragon, alone of the three fifteenth-century Peninsular kingdoms, possessed no seaboard on the Atlantic, and was thus at the same disadvantage as Columbus's native city of Genoa for participating in the exploitation of a Transatlantic New World.

³ For this relation, see pp. 177-90, above.

the Central American universal state was being established by the Aztecs of Tenochtitlan. To what did Cuzco and Tenochtitlan owe their imperial greatness? Or, to ask the same question, in regard to the Andean World, in other terms: Why was it that the Andean universal state found its nucleus on a previously obscure corner of the Andean Plateau, in the upper valley of the River Urubamba, and not in the Basin of Lake Titicaca, where the earliest and greatest development of civilization on the plateau has left its monument in the ruins of Tiahuanaco? Or, for that matter, why did not the Andean universal state find its nucleus somewhere within the original home of the Andean Civilization among the oases of the Pacific coast-land?

In the light of our foregoing survey, the answer to these questions becomes apparent when we notice the geographical fact that Cuzco in the Andean and Tenochtitlan in the Central American World were situated, like Rome and Macedonia in the Hellenic World,¹ in marches which were exposed to external pressure from formidable barbarians. Cuzco guarded the gate of the Andean World against the wild tribes of the Amazonian tropical forest; Tenochtitlan similarly guarded the gate of the Central American World against the Chichimecs: the vagrant hunting tribes of the North American arid zone, whence the Aztecs themselves were recent immigrants. Tenochtitlan always remained within close range of the northern frontier of the Central American Society over against the Chichimecs, and Cuzco within close range of the north-eastern frontier of the Andean Society over against the Amazonian savages, even when the conquests of the Aztecs in the interior of the Central American World and the conquests of the Incas in the interior of the Andean World had reached their greatest respective extents. This extreme difference in the range of Aztec and Inca expansion towards the outer darkness in the one direction and towards the interior of their own worlds in the other might seem at first sight to call for explanation; but reflexion shows that, on the contrary, this permanent proximity of both the Inca and the Aztec capital to a dangerous barbarian frontier, so far from requiring to be explained, itself explains why it was that the Andean and the Central American universal state actually grew out of precisely these two nuclei. It was the stimulus of perpetual reaction to external pressure that evoked in the Aztecs and in the Incas alike the energy which was required in order to perform a great feat of political construction at home.

Why did not either Tlaxcala or Cholula, rather than Tenochtitlan, become the nucleus of the incipient Central American universal

¹ See pp. 160-1, above.

state? Because these cities of the interior lacked the stimulus of external pressure from the Chichimecs of the outer darkness—a stimulus which never ceased to act upon Tenochtitlan on the frontier. And why did the Collas of the Titicaca Basin go down before the Incas of the Urubamba Valley in that trial of strength between two neighbouring Andean highland confederacies which was the beginning of the Incas' imperial career? The answer to this latter question may be given in terms of physical geography. 'Cuzco, the ancient capital of Ttahu-ntin-suyu, the Land of the Four Sections, otherwise the Inca Empire, lies in the drainage of the Amazon river-system. . . . The small torrential streams that flow through Cuzco pour themselves into the Urubamba, which is a tributary of the Ucayali, which in turn empties into the Marañon, just as that does into the Amazon.'¹ In other words, the physiography of the Inca section of the frontier between the Andean Civilization and an Amazonian barbarism facilitated and even invited barbarian incursions into the Andean domain and therefore kept the Andean wardens of the marches in this sector for ever on the *qui vive*. On the other hand, the Collao, in the Basin of Lake Titicaca, was safely insulated from the Amazonian savages by those 'snow-clad peaks of the Eastern Cordillera—Sorata, Huayna Potosi, and Illampu'—which 'bite into the sky with glittering white teeth'² on the horizon that unfolds itself before the gaze of the visitor to Tiahuanaco. The grimness of the physical environment in this rough country, from which the ancient builders of Tiahuanaco had perhaps derived their stimulus,³ may have been the undoing of their latter-day successors the Collas—not because it presented the Collas, any more than their local predecessors, with a physical challenge beyond their strength, but, on the contrary, because it shielded them from a stimulating human pressure to which their neighbours and contemporaries, the Incas, were exposed. The absence of this potent human stimulus in the Collao may have been the handicap which brought defeat upon the Collas when they had to meet the Incas in battle.

VI. THE STIMULUS OF PENALIZATIONS

The Nature of the Stimulus

We have now concluded our survey of the stimulus of the human environment when it takes the form of continuous external pressure. Let us next examine its effect when it takes the form of social penalization.

¹ Means, P. A.: *Ancient Civilisations of the Andes* (New York 1931, Scribner), p. 17.

² Means, *op. cit.*, p. 130.

³ See the fuller quotation from Means, *op. cit.*, *loc. cit.*, in II. C (ii) (b) 2, vol. i p. 322, above.

The nature of this effect may be indicated by an analogy between social phenomena and physical. It is a well-known fact that when a living organism is penalized, by comparison with other representatives of its species, through losing the use of a particular organ or faculty, it is apt to respond to this challenge by specializing in the use of some other organ or faculty until it has secured an advantage over its fellows in this second field of activity to offset its handicap in the first. The blind, for example, are apt to develop a more delicate sense of touch than is usually possessed by people who have not been deprived of the normal human sense of sight; and this enhancement of one faculty to offset the atrophy of another seems to occur in some degree universally and as it were spontaneously, apart from the special cases in which individuals of eminent character—a Henry Fawcett or a Helen Keller—are stimulated by their personal physical handicap into making some deliberate and sustained effort of will and ingenuity.¹ Somewhat similarly, we find that, in a body social, any section or group or class which is socially penalized—either by accident or by its own act or by the act of other members of the society in which it lives—is apt to respond to the challenge of being handicapped in, or altogether excluded from, certain fields of social activity by concentrating its social energies upon other fields and excelling in these.

We may remind ourselves, once again, of our simile of 'the pollarded willow'.² The more ruthless the execution that is done by the pruner among the shoots that he finds sprouting in spring-time out of the willow's head, the more abundant will be the vitality that the tree will concentrate into the shoots which are spared, and the more vigorous, therefore, will be the growth of these surviving shoots in the course of the season.

We may find an alternative simile, within the social sphere, in a famous incident in the history of the Hellenic Society. When the rising religion of the internal proletariat of the Hellenic World in its universal state was persecuted by the dominant minority, the Roman Imperial authorities were able to suppress the public practice of Christianity, but they failed to suppress Christianity itself: they merely drove it underground. The prohibition of Christian worship on the surface of pagan Rome stimulated the Christians to create for themselves a new Christian Rome in the Catacombs below the surface of the Campagna; and the City of the Catacombs

¹ Such purposive efforts are apt to carry those who make them to greater achievements than are accomplished by ordinary people who are in full possession of all their faculties, and perhaps even to greater achievements than the afflicted persons themselves would actually have accomplished if the challenge of physical penalization had not evoked in them a spiritual response that made the utmost demands upon their moral and intellectual as well as their physical energies.

² See I. C (iii) (b), vol. i, p. 168, above.

eventually triumphed over the City of the Seven Hills. The Church rose again from the bowels of the earth in order to raise in the City of the Vatican a dome which towers at this day above the Capitol;¹ and the early Latin peasant, who responded to the challenge of his physical environment by breaking in the intractable surface of the Campagna with his plough,² was emulated by the latter-day Christian denizen of the Roman slums, who responded to the challenge from his human environment by visiting the Campagna in the secrecy of the night-watches in order to carve a labyrinthine subterranean world of his own out of the solid tufa. The monument of the Latin peasant's feat is the Roman Empire; the monument of the Christian proletarian's feat is the Roman Catholic Church.

In surveying the effects of the stimulus of social penalizations, it may be convenient to start with the simplest case: a situation in which certain physical handicaps inhibit the individuals who are subject to them from following the ordinary avocations of the society in which they live. Let us remind ourselves, for example, of the predicament in which a blind man or a lame man finds himself in a barbarian society when the ordinary male member of society is a warrior—a situation which is apt to arise in 'the external proletariat' on the fringe of a decadent civilization on the eve of a *Völkerwanderung*.³ How does the lame barbarian react? Though his feet cannot carry him into battle in the company of his fellows, his hands can forge weapons and armour for other men to wield and wear; and therefore, since he cannot use all his limbs to good effect in the normal activities of Man in the human environment into which he has been born, he counteracts his handicap by using those limbs in which he is sound to better effect than his fellows know how to use them—in a sleight of hand that is all his own. So he becomes the skilled artificer who is the workaday prototype of lame Hephaestus and lame Weland in the World of Mythology. And how does the blind barbarian react? His predicament is still worse than his lame brother's, for he cannot use his hands in the smithy to any better purpose than on the battle-field; yet he can use them to strike the harp in harmony with a voice that rings as clear and sweet as any other man's, and he can use his mind to make poetry out of the human life in which he cannot take an active part.

¹ Gibbon, sitting among the ruins of Ancient Rome on the Palatine, and listening to the friars singing Vespers among the ruins of Ancient Rome on the Capitol, was inspired to write *The History of the Decline and Fall of the Roman Empire*. (See Part XIII, below.)

² See II. D (i), pp. 16-17, above.

³ This predicament has been touched upon in II. B, vol. i, p. 190, above, apropos of the phenomenon of the Division of Labour. For the blind bard as an institution, see the survey of examples that is given by Subotić, D., in *Yugoslav Popular Ballads* (Cambridge 1932, University Press), pp. 22-3.

Nor seeks nor finds he mortal blisses,
But feeds on the ærial kisses
Of shapes that haunt thought's wildernesses.

But from these create he can
Forms more real than living man,
Nurslings of Immortality.¹

The deeds of god-like Achilles and Agamemnon only live on in the verses of 'blind Thamyras and blind Maeonides'. The fame which the barbarian warrior desires above all things, and in quest of which he wanders over the face of the Earth 'like as a lion that is greedy of his prey',² is in the barbarian poet's hand and voice and mind to give or to withhold.

Vixere fortes ante Agamemnona
Multi, sed omnes illacrimabiles
Urgentur ignotique longa
Nocte, carent quia vate sacro.³

In the barbarian's universe, the blind bard, who cannot wield either warrior's sword or blacksmith's hammer, is yet as potent as the Galilaean fisherman who ranks as a proletarian in the Roman census but as Prince of the Apostles in the Christian dispensation. Homer, like Peter, is an arbiter of human destinies.⁴ 'So the last shall be first and the first last.'⁵

So much for the stimulus of social penalizations when these are the automatic consequence of physical disabilities. When we pass on to the penalization which is imposed by poverty, we may observe, for example, in an English 'public school', that the 'commoners', who have been born in well-to-do homes and have come to be where they are, without exertions of their own, by reason of their parents' capacity to pass muster and to pay the school fees, are less apt to do hard work at school than their schoolfellows of the same social class and social—but not personal—background who are 'scholars'. The 'scholars' know that their parents could not have afforded to send them to a school of this kind if the boys themselves had not won 'scholarships' by their own endeavours; and they realize that, as it has been in their childhood, so it will continue to be when they are grown up. They will have to make their way by their own efforts; they will have to set off the handicap of starting life with smaller material means than the average of their class by rising above the average in intelligence and efficiency and application.

¹ Shelley: *Prometheus Unbound*.

² Horace: *Carmine*, Bk. IV, Ode 9, vv. 25-8.

³ Psalm xvii. 12.

⁴ 'And I say unto thee that thou art Peter, and upon this rock I will build my Church; and the gates of Hell shall not prevail against it. And I will give unto thee the keys of the Kingdom of Heaven; and whatsoever thou shalt bind on Earth shall be bound in Heaven; and whatsoever thou shalt loose on Earth shall be loosed in Heaven.' Matthew xvi. 18-19.

⁵ Matthew xx. 16.

Thus the penalization of poverty gives the 'scholar' a perpetual stimulus which the 'commoner' lacks except in the rare cases in which the soporific effect of 'independent means' is counteracted by personal ambition or by public spirit or by intellectual curiosity—and these are rare gifts of the Gods. Again, in an English university, we may observe that the County Council scholar, who is penalized not only by poverty but by a certain inferiority in social class, is apt to exert himself still more than the scholar from a 'public school', whose social, if not his economic, position is assured. And in general we may observe—not only in contemporary England but in every society in every age—that each class on the social ladder is apt to maintain its numerical strength, not by natural increase, but by recruitment from the classes below it, and that the topmost class, which cannot go up higher, is always making room for its recruits from below by a perpetual process of extinction in the third and fourth generation. In fact, the climber who reaches the topmost rung of the social ladder has arrived at the edge of a social abyss and has condemned his descendants—unintentionally and unwittingly—to 'walk the plank'. This social phenomenon is so manifest and so notorious that it has become proverbial. The Maghribī philosopher Ibn Khaldūn's generalization that the average duration of a dynasty is three generations¹ is an exact equivalent of the North American saying that 'It's three generations from shirt-sleeves to shirt-sleeves.'

Migration

An aptitude for rising in the social scale may also be observed among immigrants who have been impelled by the stimulus of poverty or persecution at home to seek their fortunes in a foreign country. The social handicap of finding himself in a new human environment, where he is unfamiliar with the prevailing manners and customs and language and where he has to contend with the instinctive prejudice of the native-born citizen against the immigrant alien, commonly stimulates the new-comer to put forth his energies and to keep a sharp look-out for opportunities of advancement until he has 'made good' in the country of his adoption. This is the common history of the Scotsman in modern England (and the Scottish engineer all over the World); the Flemish weaver in medieval England; the German miner in medieval Hungary; the French-Canadian factory-hand and farmer² and the Polish market-

¹ Ibn Khaldūn: *Muqaddamāt* (Prolegomena): translation by de Slane, Baron McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. i, pp. 343-59. Compare the same volume, pp. 286-90, where Ibn Khaldūn suggests that it takes four generations for a family to reach its zenith.

² See II. D (ii), pp. 71-2, above.

gardener¹ in New England; the Huguenot silk-weaver in Spital-fields and his fellow exiles whose descendants have distinguished themselves in every walk and circumstance of life in almost every Protestant country: England, Württemberg, Prussia, South Africa.² In the Arabic World, it is the history of the Hadramī trader in Java.

Slavery

Perhaps the most extraordinary illustration on record of the immigrant's aptitude for social efficiency is the history of the vast concourse of immigrants from all the countries round the Mediterranean who were brought to Italy as slaves during those two terrible centuries between the outbreak of the Hannibalic War and the establishment of the Augustan Peace which were the climax of the Hellenic 'Time of Troubles'.

The handicap under which these slave-immigrants began their new life is almost beyond imagination. Some of them were heirs to the cultural heritage of the Hellenic Civilization; and these had seen their whole spiritual and material universe tumble about their ears when their beautiful cities, which Gods had guarded and men respected from of old, had been put to the sack and the citizens sold into slavery against all laws human and divine and all precedents in Hellenic history. The Coronean captives on the Delian slave-market in the year 171 B.C. might have cried out to their Haliartian companions in misfortune³ in the words of the last messenger who brought tidings of evil to Job: 'Behold, there came a great wind from the wilderness and smote the four corners of the house, and it fell upon the young men and they are dead; and I only am escaped alone to tell thee.'⁴ Indeed, the calamity was overwhelming, even for those slave-immigrants to Italy who had been taken, not from the dominant Hellenic minority in the Hellenic

¹ The writer of this Study once drove through a string of villages in the Connecticut Valley in which all the houses were the handiwork of eighteenth-century colonists of English origin, while all the present inhabitants (in A.D. 1925) were immigrant Poles who were making a good living by growing onions on land which had ceased to yield a profit in native-born American hands. The Polish immigrant prospered here because he worked longer hours than his native-born American predecessor and because every member of the Pole's large family laboured in the fields side by side with the head of the household. The children of the original Polish immigrants were already beginning to attend the local American high schools, and it was evident that the third generation would win their way into the universities with the ultimate result that the fourth generation would cease to benefit by the stimulus which had impelled their elders to climb towards the top of the social tree!

² 'One drop of Huguenot blood in the veins is worth a thousand a year' is a saying that is attributed to T. H. Huxley. The observation is acute; but of course the Huguenot's money-making power is not an attribute of his race. In race, the Huguenot is no different from his kinsmen who still remain in France. And, if it is true that the Huguenot shows a greater aptitude for making money than the Catholic or agnostic Frenchman who has stayed at home, his eminent business ability is to be interpreted as a response to the challenge of having been driven into exile without resources—a challenge to which the majority of the French nation has not been exposed.

³ See Livy xlii. 63, and xliii. 4.

⁴ Job i. 19.

World, but from the Oriental 'internal proletariat' which had lost its social heritage already, or from the barbarian 'external proletariat' which had none to lose; for there were other grievous losses of a personal kind that were inherent in enslavement. All these slave-immigrants alike had lost their personal liberty; they had been branded as human chattels instead of human beings with human rights; they had been uprooted from their homes and separated for ever from their families; and they had been subjected to new conditions of life which were almost beyond bearing. Their Roman masters, who had purchased their bodies wholesale as a speculative investment, thought only of wringing the utmost possible profit from their labour. The Roman law treated slaves with a harshness that reflected the apprehensions of a Roman governing class which was ever conscious of the volcanic stirrings of a servile under-world. Some of the recruits to the Roman servile labour-force had to spend their days working in chain-gangs on the plantations and their nights in semi-subterranean prisons; others were condemned to mines and quarries in which no worker's life was worth more than a few years' purchase. The minority whose lot was the relative independence of the slave-herdsman or the relative amenity of domestic service were fortunate; and it might have seemed that even this fortunate minority had no future. There was an ancient Greek saying that 'The day of enslavement deprives Man of half of his Manhood';¹ and this saying was terribly fulfilled in the debasement of the slave-descended urban proletariat of Rome which lived—not by bread alone, but by 'bread and shows'²—from the second century B.C. to the sixth century of the Christian Era until the flesh pots failed and the people perished off the face of the Earth. This long-drawn-out life-in-death was the penalty of failure to respond to the challenge of enslavement; and no doubt that broad path of destruction was trodden by a majority of those human beings of many different origins and antecedents who were enslaved *en masse* in the most evil age of Hellenic history. Yet some there were, nevertheless, who did respond to the challenge and did succeed in 'making good' in one fashion or another.

Some rose in their Roman masters' service until they became the responsible administrators of great estates; and Caesar's estate itself, when it had grown into the universal state of the Hellenic World, continued to be administered by Caesar's freedmen. Others,

¹ The lines are placed in the mouth of the slave-swineherd Eumaeus in the *Odyssey*:

ἡμῶν γὰρ τ' ἀρετῆς ἀποαίνονται εὐρύσσεια Ζεὺς
ἀνὴρ, εὖτ' ἂν μιν κατὰ δούλιον ἡμᾶρ ἔλθῃσιν. (*Od.* XVII, ll. 322-3.)

² 'Panem et circenses' (Juvenal, *Satire* x, l. 81).

whom their masters established in petty business, succeeded in purchasing their freedom out of savings which they made on the share of the profits that their masters allowed them; and some of these afterwards rose to eminence and affluence in the Roman business-world. Others remained slaves in this world to become philosopher-kings or fathers of churches in another; and of such was the Kingdom of Heaven. The true-born Roman who might justly and sincerely condemn the illegitimate power of a Narcissus or the ostentatious wealth of a Trimalchio would delight to honour the wisdom and serenity of the lame slave Epictetus; and he could not but admire—though he might not approve—the enthusiasm of that nameless multitude of slaves and freedmen whose faith was moving mountains.¹ During the five centuries which intervened between the Hannibalic War and the Conversion of Constantine, the Roman authorities saw this miracle of servile faith being performed under their eyes and being repeated—in defiance of their utmost efforts to arrest it by physical force—until eventually they themselves succumbed to it. For the slave-immigrants who had lost their homes and their families and their property still kept their religion and handed it down to their descendants in Italy. The Greeks brought the Bacchanalia, the Anatolians the worship of Cybele (a goddess who long outlived the Hittite Society in whose womb she had been conceived); the Egyptians brought the worship of Isis, the Babylonians the worship of the Stars, the Iranians the worship of Mithra, the Syrians Christianity. *Syrus in Tiberim defluxit Orontes*;² and the confluence of these waters raised a social issue which revealed the limitations of a slave's subjection to his master.

The issue was whether an immigrant religion of the internal proletariat was to swamp the indigenous religion of the dominant minority of the Hellenic Society. For, when once the waters had met, it was impossible that they should not mingle; and, when once they had mingled, there was little doubt as to which current would prevail if Nature were not counteracted by Art or by Force. The tutelary Gods of the Hellenic World—Attic Athene the Keeper of the City and Spartan Athana of the Brazen House; Tyche of the Antiochenes and Fortuna Praenestina; and even the omnipotent Dea Roma and the Saviour Divus Caesar³—had already withdrawn

¹ Marcus Aurelius was impressed by the readiness of the Christians at any moment to die for their faith, though he disapproved of its psychological basis, which he describes as *παράφαις* (? 'mass suggestion' or 'esprit de corps') in contrast to what seems to the philosopher the right basis: that is to say, rational judgement (Marcus Aurelius: *Meditations*, xi. 3).

² Juvenal: *Satire* iii, l. 62. It was at Antioch-on-Orontes that the followers of Jesus were first called Christians (Acts xi. 26).

³ See I. C (iii) (e), Annex, vol. i, p. 443, above.

from the intimate life-giving communion in which they had once lived with their worshippers.

Excessere omnes, adytis arisque relictis,
Di quibus imperium hoc steterat.¹

On the other hand, the Gods of the internal proletariat had proved themselves to be in truth their worshippers' 'refuge and strength, a very present help in trouble'.² If these Gods and those, who now divided the allegiance of Society between them, were left to contend with one another for the allegiance of the whole, the battle would assuredly go as it had gone in Israel when Elijah had challenged the prophets of Baal;³ and in face of this prospect the Roman authorities halted for five centuries between two opinions. Should they take the offensive against these foreign religions which were making their way, by peaceful penetration, into Roman hearts? Should they attempt to stamp them out by pitting against their uncanny other-worldly power the Roman World-State's irresistible concentration of mundane force? Or should they rather welcome these new Gods who were offering to fill a spiritual void—unacknowledged but not unfelt—that had been left in the Roman universe by the old Gods' departure? Every one of the new Gods appealed to some section of the Roman governing class. Mithra appealed to the soldiers, Isis to the women, the Heavenly Bodies to the intellectuals, Dionysus to the Philhellenes, Cybele to the fetish-worshippers. In the year 205 B.C., in the crisis of the Hannibalic War, the Roman Senate anticipated Constantine's reception of Christianity by receiving, with official honours, the magic stone, fallen from Heaven and charged with the divinity of Cybele, which was the talisman of Anatolian Pessinus.⁴ In the year 186 B.C., during the brief breathing-space between the Hannibalic affliction and the Gracchan, they anticipated Diocletian's persecution by suppressing the Bacchanalia.⁵ The long Battle of the Gods, which thus began and ended, was the counterpart of an earthly contest between the slave-immigrants and their Roman masters; and, in this dual conflict, the slaves and the slaves' Gods won.

Caste

The same stimulus of penalization which is administered by poverty and by class-inferiority and by slavery is also administered by racial discrimination in a state of society in which two or more

¹ Virgil: *Aeneid*, Bk. II, ll. 351-2 (already quoted in I. C (i) (a), vol. i, on p. 57, in footnote 2, above).

² Psalm xlv. 1.

³ 1 Kings xviii.

⁴ See the account of the translation of Cybele from Pessinus to Rome which is given by Livy in Book XXIX, chs. 10-14.

⁵ See the account of this persecution which is given by Livy in Book XXXIX, chs. 8-19.

racess live intermingled without merging into one. Such states of society are apt to arise by immigration in two alternative ways. An indigenous population may be conquered by invaders who forbear to exterminate it and disdain to coalesce with it and are therefore constrained to tolerate it in the status of a depressed caste.¹ Alternatively, an indigenous population may admit peaceful immigrants to live on sufferance as perpetual strangers in its midst on more or less disadvantageous and humiliating conditions. In both these varieties of what is ultimately the same situation, the dominant race is apt to reserve certain statuses and certain avocations as its own exclusive preserves, and to impose upon the penalized race the necessity of cultivating other fields of social activity if it is to find a living at all. The 'reserved' occupations usually include all those which have high social prestige—the priesthood, the business of government, the ownership of land, the bearing of arms, and the civilian 'liberal professions'—as well as the fundamental economic activity of Society, which has usually been agriculture in the social economies of societies in process of civilization down to recent times. By a process of exhaustion the penalized race is apt to find itself virtually confined to the field of trade and handicraft; and, just because the field is narrow, the penalized race is stimulated to make this field all its own and to conjure out of it, by a *tour de force* which fills the dominant race with astonishment and resentment, a harvest of wealth and power which this Naboth's vineyard would hardly have yielded to hands not debarred from other handiwork.

The classic example of this effect of racial discrimination is the strongly marked tendency in the Hindu Society for castes to become coincident with occupations; but this tendency in India is not without parallels elsewhere. In Europe, tinkering and fortune-telling have been monopolized by the Gipsies,² and in Arabia metal-working by the Sunnā;³ and other examples are to be found in the New World which has been called into existence, since the close of the fifteenth century of the Christian Era, by the expansion of Western Christendom over all the habitable lands and navigable seas of the planet. Round the shores of the Pacific—an ocean which has been transformed from an insulator into a medium of communication by Western maritime enterprise within the last century—the Chinese immigrant who has been admitted on sufferance

¹ The three possible alternative outcomes of the impact of one society upon another—that is, extermination, assimilation, and caste—are examined further in Parts VIII and IX, below.

² Strictly, perhaps, the occupational specialization of the Gipsies in Europe is not so much a parallel to, as a derivative from, the convergence between caste and occupation in India, since the Gipsies are by origin a vagrant Hindu caste which has happened to spread beyond the boundaries of the Hindu World.

³ For this metal-working caste in Arabia, see The British Admiralty: *Handbook of Arabia*, vol. i (London, no date, H.M. Stationery Office), pp. 92, 94, and 610.

into countries under Western control has succeeded, as coolie and laundryman and shopkeeper, in making his fortune out of those meagre patches of the economic field which have been grudgingly thrown open to him. In British Malaya and Netherlands India to-day, there are Chinese millionaires who emulate Trimachio's wealth without displaying his vulgarity; and if Petronius Arbiter's fictitious portrait of the penalized proletarian immigrant who has 'made good' in this world is reproduced in these authentic Chinese counterparts in 'the real life' of our modern society, we can also detect a counterpart to the historic figure of the ancient slave-philosopher in Harriet Beecher Stowe's fictitious portrait of 'Uncle Tom': a character who emulates the serenity of Epictetus without aspiring to his mental power.

The Negro slave-immigrant into modern North America has been subject to the twofold penalization of legal servitude and racial discrimination; and at this day, some seventy years after the first of these two handicaps has been removed, the second still weighs as heavily as ever upon the coloured freedman. From first to last, the Negro's sufferings at the hands of the English-speaking peoples of the Western World have probably been still greater in the aggregate than those of the Greeks and Orientals and barbarians who were enslaved by the Romans. The horrors of the Delian slave-market in the second century B.C. are hardly to be compared with those of 'the middle passage' on a Transatlantic slave-ship in the eighteenth century of the Christian Era; and even if we allow that, in the next stage of the slave's career, the conditions of servile life and labour on the plantations of modern America may not have been so bad as they were on those of ancient Italy, we must add that the Roman slave who had once landed alive on Italian soil saw his horizon faintly yet distinctly illuminated by a gleam of light which has never been vouchsafed to the Negro survivor of the Transatlantic voyage nor to any of his descendants even in the third or fourth generation.

The harshness of the Roman Law in its treatment of the slave, so long as he remained in servitude, was mitigated by its facility in the procedure of manumission and by its liberality in making the personal act of manumission carry with it automatically the political consequence of enfranchisement; and these legal provisions for the mitigation of the Roman slave's lot were implemented by social custom. The Roman masters who were merciless in exploiting their slaves were generous in granting them their freedom; and when once the legal formality had been accomplished, the social stigma of servile origin was extinguished in a few generations. In the third generation the poet Horace could afford to remind his readers that

he was *libertino patre natus*¹ in order to point the contrast between what he had once been and what he had since become in virtue of his own genius and his intimacy with Maecenas. How different from the agony with which a modern American citizen who knows that there is a tincture of Negro blood in his veins² keeps watch and ward over his secret when he has surreptitiously violated 'the colour bar' by 'passing' from the black to the white side of the caste-line. The Roman freedman was wholly free from the doom of perpetual racial ostracism to which the American Negro freedman has been condemned without any prospect of reprieve even for his remotest posterity; and it is not surprising to observe that the Negro, finding the scales thus permanently and overwhelmingly weighted against him in this world, has turned to another world for consolation.

The Negro appears to be answering our tremendous challenge with a religious response which may prove in the event, when it can be seen in retrospect, to bear comparison with the ancient Oriental's response to the challenge from his Roman masters. The Negro has not indeed brought any ancestral religion of his own from Africa to captivate the hearts of his White fellow citizens on the American Continent. His primitive social heritage was of so frail a texture that every shred of it was scattered to the winds at the first impact of our Western Civilization. Thus he came to America spiritually as well as physically naked; and he has met the emergency by covering his nakedness with his enslaver's cast-off clothes. The Negro has been adapting himself to the rigours of his new social environment by rediscovering, in Christianity, certain original meanings and values which Western Christendom has long ignored. Opening a simple and impressionable mind to the Gospels, he has divined the true nature of Jesus's mission. He has understood that this was a prophet who came into the World not to confirm the mighty in their seat but to exalt the meek and the humble.³ 'At that time Jesus answered and said: "I thank thee, O Father, Lord of Heaven and Earth, because thou hast hid these things from the wise and prudent and hast revealed them unto babes."⁴ The Syrian slave-immigrants who once brought Christianity into Roman Italy performed the miracle of establishing a new religion which was alive in the place of an old religion which was already dead. It is possible that the Negro slave-immigrants who have found Christianity in America may perform the greater miracle of raising the dead to life. With their childlike spiritual intuition and their genius for

⁴ Matthew xi. 25; cp. Psalm viii. 2.

giving spontaneous aesthetic expression to emotional religious experience, they may perhaps be capable of rekindling the cold grey ashes of Christianity which have been transmitted to them by us, until in their hearts the divine fire glows again. It is thus, perhaps, if at all, that Christianity may conceivably become the living faith of a dying civilization for the second time. If this miracle were indeed to be performed by an American Negro Church, that would be the most dynamic response to the challenge of social penalization that had yet been made by Man.

Religious Discrimination

When we pass from racial to religious discrimination, we find that, *mutatis mutandis*, the phenomena are the same. A religious denomination which is penalized on account of its persuasion by being debarred from engaging in agriculture or in 'the liberal professions', is apt to respond, like a penalized caste, by developing an exceptional proficiency in trade or handicraft. The Hindu Banya has his analogue in the Jew; the Arabian Sunnā' have theirs in the otherwise obscure North American religious fraternity at Oneida, in New York State, whose members have made a name for themselves in the business-world as the manufacturers of 'Community Plate'.

The results of religious discrimination may be studied in three different situations: first, where the adherents of the penalized denomination are members of the same society and heirs of the same civilization as the adherents of the privileged denomination among whom they live; second, where the respective adherents of the penalized and of the privileged denomination belong to two different civilizations which are both still 'going concerns'; third, where the adherents of the privileged denomination belong to a civilization which is still a 'going concern', while the adherents of the penalized denomination represent a civilization which only survives as a 'fossil'.¹

The first of these situations may be illustrated from the history of the English-speaking peoples of the Western World. In England, the re-establishment of the Anglican Church and the galling but not intolerable penalization of other Protestant religious denominations after the Restoration of A.D. 1660—a penalization which did not altogether cease at the Revolution of A.D. 1688—had the effect of stimulating the members of the Society of Friends to distinguish themselves in industry and banking,² and other Protestant Dis-

¹ For a list of the still extant 'fossils' of extinct civilizations, see above, I. B (iii), vol. i, pp. 34-5, and I. C (i) (b), vol. i, pp. 90-2. The psychological phenomena of the contact between 'fossils' and living societies are examined in Part IX, below.

² The Quakers, who appear to have been largely recruited from the agricultural population, found themselves in a more difficult position than the Nonconformists, owing to their conscientious objection to the payment of tithes.

senters and Nonconformists to prosper in various forms of retail trade.¹ *A fortiori*, the positive persecution to which the Puritans were exposed in England in the earlier decades of the seventeenth century, before the English Civil War, and again the Mormons in the United States some two centuries later, stimulated each of these persecuted sects into reacting with proportionate vigour. While the Quakers and the Nonconformists in eighteenth-century England were able to exist and even to prosper in that state of life to which it had pleased the Establishment to confine them, both the Puritans in early seventeenth-century England and the Latter-Day Saints in early nineteenth-century America made up their minds that there was no room in the same country for themselves and for their persecutors; and accordingly they each, in their day, went out into the wilderness in order to found ideal commonwealths, after their own heart, on virgin soil where they had only to contend with Physical Nature and not with stronger human powers.

The achievement of the Pilgrim Fathers in breaking-in the rough country of New England has been reviewed in this Study already.² It was fully equalled, in its own kind, by the achievement of the Latter-Day Saints. In the early nineteenth century, it needed no less courage to venture out in wagons into the unexplored hinterland of the North American Continent than it had needed in the early seventeenth century to set sail from the shores of Europe in the *Mayflower* for an uncharted American coast. Moreover, at the journey's end, the desert basin of Utah, with the Salt Lake at its core, offered an even more forbidding landscape for a Promised Land than the site of Town Hill, Connecticut. Indeed, it may be doubted whether the Mormons would ever have 'made good' in Utah if they had not been governed by the practical genius of Brigham Young. Happily for Joseph Smith's disciples, the first khalifah of the Mormon prophet³ played Joshua's as well as Moses' part in this latter-day American exodus. Brigham Young had the vision to perceive that the salt desert could be fertilized by the sweet waters descending from its mountain rim, and he also had the power of organization and command to carry through a great co-operative scheme of irrigation. These daring and romantic foundations of new commonwealths in the virgin wildernesses of Utah and New England have their place, beside the more passive and prosaic performance of the English Nonconformists in adapting themselves to their disabilities at home, as examples of the response which the

¹ For the movement in which the English Protestant Nonconformists withdrew from public life in the seventeenth century and returned in the nineteenth, see further III. C (ii) (b), vol. iii, p. 334, below.

² See II. D (i), pp. 15-16, above.

³ For the analogy between the histories of Mormonism and of Islam, see Meyer, Eduard: *Ursprung und Geschichte der Mormonen* (Halle 1912, Niemeyer).

challenge of religious discrimination is apt to evoke from those who are exposed to it in diverse degrees.¹

The Mormon response in the United States has a parallel in Russia in the history of the Old Believers and other dissenters from the established practice of Russian Orthodox Christendom. These Russian Orthodox Christian sectaries have won freedom to follow the devices of their own hearts by going out, beyond the advancing borders of the Russian Empire, into the wildernesses of Siberia and the Caucasus and the Eurasian Steppe. These sectarian pioneer settlements in no-man's-land have eventually been incorporated into the Russian body politic, as Utah has been incorporated into the United States; but the latter-day Czarism, in its treatment of schismatics, exercised a politic form of discrimination which was already customary in Western monarchies in the seventeenth century. While penalizing its Nonconformists in the interior, it tolerated and even encouraged them in the marches as unorthodox messengers of Holy Russia who could serve to prepare her way before her, just because they were officially beyond her pale.

The Phanariots

The situation arising when the respective adherents of the penalized and the privileged denomination belong to two different civilizations which are both 'going concerns' may be illustrated from the *ancien régime* of the Ottoman Empire as it existed down to the Revolution of A.D. 1908. In the Ottoman Empire, the main body of Orthodox Christendom had been endowed, by intruders of alien faith and culture, with a universal state which the Orthodox Christian Society could not do without yet was unable to establish for itself;² and the Orthodox Christians had paid for their social incompetence by ceasing to be masters in their own house. The Muslim conquerors who established and maintained the *Pax Ottomanica* in the Orthodox Christian World exacted payment, in the form of religious discrimination, for the services which they were rendering to their Christian subjects willy-nilly; and here, as elsewhere, the adherents of the penalized denomination responded to

¹ We may observe that while the sedentary Nonconformists of England learnt the lesson of toleration and eventually imparted it to their Anglican fellow countrymen, the Pilgrim Fathers and the Mormons both justified their persecutors in retrospect by persecuting others as soon as they had the power and the occasion. The ideal commonwealth which they went forth to found in the wilderness was not to be a place where every sect and every individual would be free to worship according to private conscience, but a place in which the pioneers would be able to do unto others what their persecutors had done unto them. The Quakers discovered this to their cost when they came out to Massachusetts at the Pilgrim Fathers' heels. An honourable and remarkable exception to the general spirit and practice of early New England was to be found in the State of Rhode Island, which from the outset granted freedom of conscience to all who settled on its diminutive territory.

² On this point, see further, Part III. A, vol. iii, pp. 26-7, below.

the challenge of discrimination by becoming past-masters in those pursuits to which their activities were now confined.

In the old Ottoman Empire, none who were not 'Osmanlis might govern or bear arms; and in large tracts of the Empire even the ownership and cultivation of the land passed out of the hands of the subject Christians into those of their Muslim masters. In these circumstances, the several Orthodox Christian peoples who found themselves forcibly united under a common Ottoman rule now came—for the first and last time in their histories—to a tacit but effective mutual understanding. They were inhibited by the 'Osmanlis' monopoly of sovereign power from carrying on their habitual internecine warfare with one another for the local mastery of cities and provinces. They were stimulated, by the 'Osmanlis' monopoly of 'the liberal professions', into parcelling out among themselves the humbler trades, which remained open for Christian practitioners, and learning each to excel in some special occupation of their own. By this road, the Orthodox Christian subjects of the Ottoman Pādishāh gradually regained a footing within the walls of the Imperial capital, from which they had been deliberately evicted wholesale by Mehmed the Conqueror. The Turkish-speaking Orthodox Christian Qaramanlis from the interior of Anatolia and the Romance-speaking Orthodox Christian Vlachs from the highlands of the Balkan Peninsula succeeded in establishing themselves in Constantinople as grocers; their Greek-speaking co-religionists from the islands of the Aegean Archipelago set up in business on a more ambitious scale; the Orthodox Christian Albanians came to Constantinople as masons; the Orthodox Christian Montenegrins as hall-porters and commissionaires. Even the bucolic Bulgars, who had managed to keep a firmer grip upon the land than the Greeks, came to find a livelihood in the suburbs of Constantinople as grooms and market-gardeners. In Ottoman Syria, likewise, the Arabic-speaking Orthodox Christians gravitated towards the towns and tended to specialize in trades and handicrafts, while the Arabic-speaking Muslims remained cultivators of the soil in the countryside.

Among the Orthodox Christian re-occupants of Constantinople, there was one coterie—the so-called Phanariots—who were stimulated by the challenge of penalization to such a degree that they actually rose to be the virtual partners and potential supplanters of the 'Osmanlis themselves in the political administration and control of the Ottoman Empire. The Phanar, from which the Phanariots derived their name,¹ was the extreme north-western corner of

¹ The word Phanar itself is the modern Greek for 'lighthouse'—the quarter being called after a lighthouse which stood here in the angle between the land-walls of Constantinople and the south shore of the Golden Horn.

Stamboul, which the Ottoman Government had grudgingly abandoned to its Orthodox Christian subjects as the equivalent of a ghetto. The Oecumenical Patriarchate made its new head-quarters here after the Church of the Holy Wisdom had been converted into the Mosque of Aya Sofia and the Church of the Apostles demolished to make way for the Mosque of the Conqueror. In this apparently unpromising retreat, the Patriarchate became the rallying-point and the preserve of the Greek-speaking Orthodox Christians from the Aegean Archipelago who had found their way to Constantinople and had prospered there in trade; and these 'Phanariots' developed two special accomplishments. As merchants on the grand scale, they entered into commercial relations with the Western World and acquired a first-hand knowledge of Western manners and customs and Western languages. As managers of the Oecumenical Patriarchate's affairs, they acquired a wide practice and close understanding of Ottoman administration, since, under the old Ottoman régime, the Oecumenical Patriarch was the official intermediary between the Pādishāh and his Orthodox Christian subjects throughout the Empire and was invested, in this capacity, by delegation, with many of the functions of sovereignty over his co-religionists. These two accomplishments, together, made the fortunes of the Phanariots when, in the secular conflict between the Ottoman Empire and the Western World, the tide definitely turned against the 'Osmanlis after their second unsuccessful siege of Vienna in A.D. 1682-3.¹

The change introduced certain formidable complications into Ottoman affairs of state. Before the reverse of 1683, the 'Osmanlis had always been able to count upon settling their relations with their Western Christian adversaries and with their Orthodox Christian subjects to their own satisfaction by the simple application of force. Their military decline confronted them with two new problems. They had now to negotiate at the conference-table with Western Powers whom they could no longer defeat in the field; and they had to consider the feelings of Orthodox Christian subjects whom they could no longer be sure of holding down. In other words, the Ottoman Empire could no longer dispense with skilled diplomatists and skilled administrators; and the necessary fund of experience, of which the 'Osmanlis found themselves destitute in their hour of need, was opportunely placed at their disposal by the Phanariots. In consequence, the 'Osmanlis were constrained to disregard the precedents and tamper with the principles of their own régime by conferring upon the Phanariots

¹ For this turn of the tide and its eventual effects upon the Turkish and the Austrian *éthos*, see II. D (v), pp. 179-88, above.

the monopoly of four high offices of state which were key-positions in the new political situation of the Ottoman Empire.¹ In the course of the eighteenth century of the Christian Era, the political power of the Phanariots was steadily enhanced by the specific influence and patronage which these offices carried with them, and still more potently by the general effect of the steady increase in the political pressure from the West—an increase which was inevitably accompanied by a corresponding appreciation in the political value of the one element inside the Ottoman Empire which was capable, at the time, of coping with 'the Western Question'. A hundred years after the turn of the tide under the walls of Vienna in 1683, it looked as though the result of Western pressure might be to endow the old Ottoman Empire with a new governing class by first forcing the 'Osmanlis to take the Phanariots into partnership and then enabling the Phanariots to make themselves, in effect, the senior partners in the Ottoman firm.²

¹ These four offices were the Dragomanship of the Porte, the Dragomanship of the Fleet, and the hospodarships of the autonomous principalities of Wallachia and Moldavia. The two dragomanships were new creations; the two hospodarships were existing offices which were now placed in Phanariot hands.

The importance of the dragomanships is not to be measured by the literal meaning of the title. The 'Osmanlis sought to 'save their faces' by giving the modest title of 'interpreters' ('dragoman' = *terjümen*) to Phanariot officials who, in effect, discharged the functions of a Secretary of State for Foreign Affairs and a Secretary of State for the Navy and whose power and patronage, *ex officio*, were not much less extensive than they would have been in any Western monarchy of the day.

As for the principalities of Wallachia and Moldavia, these had been founded by Orthodox Christian pioneers of Rumanian nationality who had descended from the Transylvanian highlands in the fourteenth century of the Christian Era and had wrested the extreme south-western corner of the great Eurasian Steppe from the Nomads. The two principalities had recognized the suzerainty of a paramount Power from the beginning of their existence, but their original suzerain had been the King of Hungary, from whose dominions their founders had come. The transference of their allegiance to the Ottoman Padişah had been one of the incidents in the long duel between Hungary and the Ottoman Power which ended on the field of Mohacz; and since the political orientation of these principalities was one of the factors on which the issue of the struggle between Hungary and Turkey depended, the Wallachian and Moldavian Rumanians had been able to come to far more favourable terms with the 'Osmanlis than any of their co-religionists on the south side of the Danube. They had secured from the Padişah a pledge that, under his suzerainty, they should always be governed by princes of their own faith, and that no Muslim places of worship and no Turkish military fiefs or colonies should ever be established on their territories. The Ottoman Government faithfully observed these undertakings and implemented the first of them, to begin with, by placing the two Ruman principalities under local Ruman princes. This practice was abandoned after the turn of the tide in A.D. 1683, when the principalities acquired a new strategic and political importance as marches of the Ottoman Empire over against the Danubian Hapsburg Monarchy on the one hand and the Russian Empire on the other. When Peter the Great invaded Moldavia in 1711, the reigning prince, Demetrius Cantemir, went over to his side; and this danger-signal moved the Ottoman Government to strengthen its control over the principalities, without violating the letter of its bond, by thenceforth appointing Orthodox Christian princes who were not of Rumanian nationality and who had no hereditary local influence or attachments. Accordingly, from A.D. 1711 to 1821, the incumbencies of the two principalities became a perquisite of the Phanariots—an arrangement which safeguarded Ottoman interests and lined Phanariot pockets at the local Rumanian population's expense.

² It was in this expectation that the Empress Catherine II of Russia played with the idea of re-establishing the East Roman Empire after the great Russian victory over the 'Osmanlis in the Russo-Turkish War of A.D. 1768-74.

In the event, the Phanariots failed to achieve their 'manifest destiny' because, towards the end of the eighteenth century, the Western pressure attained a degree of intensity at which its nature underwent a sudden transformation. The purely external pressure, of a military and diplomatic kind, which began to be exerted upon the Ottoman Empire by the great Powers of the Western World after the Second Siege of Vienna, was reinforced, after the American and French revolutions, by a far more penetrating and pervasive and disruptive pressure which was exerted, from within, by the Ottoman peoples themselves through that process of cultural fermentation and social metabolism, for which we have coined the name 'Westernization'. The general operation of this process in the Ottoman Empire has been touched upon already;¹ and in this place we need only recall the two facts that the political gospel of 'Westernization' was Nationalism and that the Greeks, being the first of the Ottoman peoples to enter into intimate relations with the West, were also the first whom the virus of Western Nationalism infected. Between the outbreak of the French Revolution and the outbreak of the Greek War of Independence, the Greeks were under the spell of two incompatible aspirations. They had not given up the Phanariot ambition of entering into the whole heritage of the 'Osmanlis and keeping the Ottoman Empire intact as a 'going concern' under Greek instead of Turkish management; and at the same time they had conceived the new ambition of establishing a sovereign independent national state of their own—a Greece which should be as Greek as France was French—in order that the Greeks 'also' might 'be like all the nations'² of the Western World.

In their quest for this 'pound of flesh' the Greek nationalists eventually overreached themselves; but their miscalculation was not the same as Shylock's. The legendary Jew desired his victim's death, but forgot to stipulate for shedding his blood; the Greeks failed to foresee that the death of the Ottoman Empire must result from the bloodshed which they contemplated, and that therefore the new Greece of their dreams could be nothing but a goblet of the old Empire's dismembered carcass. Their discomfiture was even more ironic than their Shakespearian prototype's; for fate permitted them to draw and use the knife in order to expose their miscalculation by an experiment which could never be undone. The incompatibility of the two Greek aspirations was demonstrated conclusively in 1821 when the Greeks attempted to realize both of them simultaneously.

When the Phanariot Prince Hypsilanti crossed the Pruth, from his 'jumping-off ground' in Russia, in order to make himself master

¹ See II. D (v), pp. 181-6, above.

² I Samuel viii. 20.

of the Ottoman Empire, and the Maniot chieftain Petro Bey Mavromikhális descended from his mountain-fastness in the Morea in order to carve out an independent Greece, the outcome of both enterprises was a foregone conclusion. The resort to arms, in itself, spelt the ruin of Phanariot aspirations, since the Phanariot ascendancy in the Ottoman Empire could only have been consummated by an uninterrupted process of 'peaceful penetration'. Prince Hypsilanti's armed incursion into the Danubian Principalities produced an electric effect upon the 'Osmanlis. The reed on which they had been leaning for more than a century had pierced their hand;¹ and their fury at this betrayal nerved them to break the treacherous staff in pieces and to stand again at all costs on their own feet. In 1821, the 'Osmanlis retorted to Prince Hypsilanti's act of war by destroying at one blow the fabric of power which the Phanariots had been peacefully building up for themselves since 1683; and this was the first step in a process of eradicating all non-Turkish elements from the remnant of the 'Osmanlis' heritage—a process which reached its climax in the eviction of the Orthodox Christian minority from Anatolia in 1922.

Thus the first explosion of Greek nationalism kindled the first spark of Turkish nationalism; but the effect of Prince Hypsilanti's act upon the non-Greek Christian peoples of the Ottoman Empire was, if possible, still more untoward, from the Greek standpoint, than its effect upon the Turks. The Greek Prince's appearance in the Danubian Principalities at the head of an armed force of Greek filibusters made the local Rumanian population realize that they were in imminent danger of exchanging 'King Log' for 'King Stork'. If the Muslim 'Osmanlis had chastised their Christian subjects with whips, the Christian Phanariots showed every intention of chastising their co-religionists with scorpions. The Rumans turned Hypsilanti's raid into a fiasco by passively but effectively taking the Turkish side; and not only the Rumans but the Bulgars and the Serbs and all the other Orthodox Christian peoples of the Ottoman Empire made up their minds forthwith that it was expedient for them to remain under Turkish rule until they could be sure of exchanging it for their own national independence. Therewith, it was decided that the Ottoman Empire should not have its unity maintained and its life prolonged by a peaceful transference of control from the 'Osmanlis to the Phanariots, but should be broken up by violence into a mosaic of sovereign independent national states on the Western pattern. This procrustean operation, by which an association of occupational castes was cruelly rough-hewn into a congeries of territorial nations, began with the

extermination of the Turkish Muslim landowners in the Morea in 1821 by massacre or eviction at the hands of the local Greek insurgents, and was carried on—by the same ‘methods of barbarism’—to the bitter end, until it reached its term, a hundred years later, in the massacre or eviction of the Greek and other Christian tradesmen and artisans in Anatolia in 1922 at the hands of the Turkish nationalists.

The Qāzānlīs

Thus, after all, the Phanariots just failed to secure that ‘senior partnership’ in the Ottoman Empire which had seemed, in the eighteenth century, to be their ‘manifest destiny’. Yet the fact that they came within an ace of success is sufficient evidence of the vigour with which they had responded to the challenge of penalization. Indeed, the history of their relations with the ‘Osmanlis is an excellent illustration of the general social ‘law’ of Challenge-and-Response; and the antithesis between Greek and Turk, which has attracted so much interest and excited so much animus,¹ is explicable only in these terms and not in the racial and religious terms which have been in fashion on both sides in the popular polemics. Turcophils and Graecophils agree in attributing the historical differences in *êthos* between Greek Christians and Turkish Muslims to some ineradicable quality of race or indelible imprint of religion. They disagree simply in inverting the social values which they assign to these unknown quantities in the two cases. The Graecophil postulates an inherent virtue in Greek blood and in Orthodox Christianity and an inherent vice in Turkish blood and in Islam to make the Greek the angel and the Turk the devil that he alleges them to be. The Turcophil transposes his postulates and thereby proves the Turk an angel and the Greek a devil to his own satisfaction. Actually, the common assumption which underlies both these special pleadings is contradicted by unquestionable matters of fact.

It is unquestionable, for instance, in the matter of physical race, that the blood of Ertoghrol’s Central Asian Turkish followers which flows in the veins of the Ottoman Turkish people to-day is no more than an infinitesimal tincture. The Ottoman Turkish people has grown into a nation out of a handful of refugees, not by natural increase, but by assimilating the Orthodox Christian population² in whose midst the ‘Osmanlis have been living ever since the original settlement in Sultan Özü.³ The process was in full swing in the second generation, under Ertoghrol’s son ‘Osmān,

¹ It is perhaps worth remarking that the animus of the Greeks and Turks against one another has been surpassed by that of their respective partisans in the Western World, who have shown still greater fanaticism than their protégés.

² For the method of assimilation, see Part III. A, vol. iii, pp. 28–44, below.

³ For the challenge presented to the fathers of the ‘Osmanlis by the geographical location of this settlement, see II. D (v), pp. 151–2, above.

whom the new community adopted as its eponymous hero when it had to coin itself a new name. There is every reason to believe that the blood of the indigenous Greek and other Orthodox Christian recruits had swamped the blood of the immigrant Turkish Muslim nucleus in the racial composition of the 'Osmanlis well before the end of the first century of their existence as a distinctive community with a name of its own. If this sufficiently refutes the *a priori* racial explanation of the Graeco-Turkish antithesis, we may refute the *a priori* religious explanation by citing the following description of one of the other Turkish Muslim peoples that are in existence, side by side with the Ottoman Turks, at the present day:¹

'The Volga Turks are, on the whole, distinguished by their sobriety, honesty, thrift, and industry. By their assiduity they often acquire considerable wealth. They live on the best of terms with their Russian peasant neighbours. The chief occupation of the Qāzān Turk is trade, to which he turns at once when he has acquired a small capital by agriculture. On his commercial journeys he is always a propagandist of Islam. His chief industries are soap-boiling, spinning, and weaving. He is sometimes a worker in gold. He makes a good shoemaker and coachman. . . . These Turks are more cleanly in their houses than the Russian peasantry. . . .

'Till the end of the sixteenth century, no mosques were tolerated in Qāzān, and the Tatars were compelled to live in a separate quarter. But the predominance of the Muslims gradually prevailed, so that in the second half of the eighteenth century there were as many as 250 mosques in the Government of Qāzān. A ukase of tolerance promulgated in 1773² helped the cause of Islam among these Turks. Far from being won by Russian tolerance, the Muslims of the Volga have in modern times become more closely united than ever with the Muhammadan world. . . .

'There has been a rapid increase in the number of mosques and a steady improvement in the status of Muslim schools in the Government of Qāzān. . . . These schools have not been affected in the least by the Russian educational system. . . .

'In consequence of the attention paid to education, the percentage of Qāzān Turks who cannot read and write is extremely low. The production of printed books has also been considerable among these Muslims. . . .

'Thus, during a period of 360 years of Russian rule, the Asiatic conservatism of these Qāzān Muslims has in no way been weakened or influenced by Russian culture. . . . No conversion except among their ruling families takes place, and only the quite uneducated element is liable to be absorbed in the Russian population. . . .'³

¹ At the present day there are approximately twice as many Turkish Muslims within the frontiers of the U.S.S.R. as there are in Turkey.

² In the same year, the Ottoman Government granted its charter to the Greek Orthodox Christian community at Ayvalıq (see II. D (ii), footnote 1 on p. 40, above). The Russian and Ottoman Empires, being engaged at the time in a formidable war with one another, each found it advisable to make concessions to subject minorities which were of the same civilization as the enemy Power.—A. J. T.

³ The British Admiralty: *Manual on the Turanians and Pan-Turanism* (London, no date, H.M. Stationery Office), ch. vi (iii), 1, pp. 181-4.

It will be seen that, if the proper names in the foregoing passage were left blank, the text might serve, as it stands, to describe the Orthodox Christian Greeks of Constantinople under the old Ottoman régime just as well as the Muslim Turks of Qāzān under the Russian Czarism. This coincidence defies explanation on the hypothesis that Turks and Greeks or Muslims and Christians are what they are by reason of certain absolute racial characteristics or indelible religious hall-marks. On the other hand, it is just what we should expect on the hypothesis of Challenge-and-Response. For what has been the history of the Qāzānli Turks? Qāzān was a Muslim city which was conquered by the Orthodox Christian Muscovites within a century of the conquest of Christian Constantinople by the 'Osmanlis; and under Muscovite rule the Qāzānli Turks have had to adapt themselves, like the Stambouli Greeks under Ottoman rule, to a régime of religious discrimination. So far from being surprising, it is eminently natural that the Greek in Turkey and the Turk in Russia should have met the same challenge of religious discrimination with the same response. Both communities have concentrated their energies with success upon trade and handicraft because both have been debarred from following other walks of life as a penalty for their nonconformity with the religion of the Power under whose ascendancy they have each respectively had to live. In this connexion, the incidental fact that the Greeks in Turkey happen to have been penalized for being Christians and the Turks in Russia for being Muslims has made no difference. The common experience of being penalized on account of religion has been the governing factor in the development of both communities; and in the course of four or five centuries their identical reaction to this common experience has bred them into a 'family likeness' with each other which has quite effaced the diversity between the original imprints of Orthodox Christianity and Islam.

The Levantines

This 'family likeness' is shared by adherents of certain other religious denominations who have likewise been penalized on account of their religious allegiance and who have responded in the same way. Without extending our survey beyond the bounds of the old Ottoman Empire and the old Russian Czarism, we may observe that the distinctive characteristics of the Orthodox Christian Phanariots and the Muslim Qāzānli reappear unmistakably both in the Roman Catholic 'Levantines' and in the Protestant inhabitants of the seventeenth-century suburb of Moscow which was known as 'the Svoboda'.

These Catholics and Protestants were immigrants from Western

Christendom who were permitted to reside in the Ottoman and Russian Empires on sufferance, under certain disabilities, as in our day the Chinese are permitted to reside in countries under Western control round the shores of the Pacific.¹ These Western residents in a bygone Russia and a bygone Turkey were, indeed, in a less unfortunate position than that of the Chinese residents in California or Australia at the present time, since the Chinese are the victims of a racial discrimination from which they cannot escape by any action which it lies with them to take, whereas the Levantines could, and sometimes did, escape from the religious discrimination to which they were subject by becoming 'renegades'—a step which not only raised them from the degradation of being treated as pariahs, but threw open to them the highest positions in the Ottoman State. The same avenue of escape was open to the 'Osmanlis' Orthodox Christian subjects; and the Ottoman governing class was actually recruited, by preference and on principle, from Christian 'renegades', Christian prisoners-of-war and Christian 'tribute children' from the time of 'Osmān himself down to the turn of the tide in A.D. 1682-3.² In this respect, the Levantines were in the same position as the Phanariots; but in both communities religious apostasy, notwithstanding the strength of the inducements to it, remained the exception and did not become the rule; and the Levantine Catholics who were unwilling to renounce their religion were subject to the same disabilities under the old Ottoman régime as the indigenous Orthodox Christians. In Galata on the north shore of the Golden Horn, and in the Frankish quarters in the other 'Échelles du Levant', the Catholic *ra'iyyeh*³ lived a ghetto-life which was not very different from the life of the Orthodox Christian *ra'iyyeh* in the Phanar or the life of the Jews in the West down to the time of the French Revolution; and the Levantines duly developed the specific virtues and vices which the ghetto demands.⁴ It made no difference that they happened to be descended, in physical race, from some of the most warlike and imperious and high-spirited peoples of Western Christendom: from the medieval Venetians and Genoese and the modern French and Dutch and English. In the stifling atmosphere of their Ottoman ghetto, they must either respond to the challenge of religious penalization in the

¹ See pp. 217-18, above.

² See further Part III. A, vol. iii, pp. 28-44, below.

³ *Ra'iyyeh* means literally 'the flock' of which the Ottoman Pādīshāh was the shepherd. The term was not applied exclusively to his non-Muslim subjects. The Muslim peasantry of Anatolia were called *ra'iyyeh* as well as the Christian merchants and ecclesiastics of Constantinople.

⁴ 'Nos négocians dans les diverses échelles . . . renfermés dans leurs *kans* comme dans des prisons, ne s'embarrassent que peu de tout ce qui est étranger à leur commerce.' (Volney, C. F.: *Voyage en Syrie et en Egypte pendant les Années 1783, 1784 et 1785*, 2nd ed. (Paris 1787, Desenne et Volland, 2 vols.), vol. i, p. 142.)

same manner as other men, or else succumb. Again, the 'Nordic' physique and Protestant tradition of the Dutch and Scottish and German residents in 'the Svoboda' did not prevent the Christian denizens of this Muscovite ghetto¹ from acquiring a strong 'family likeness' to their Muslim neighbours and contemporaries and equals in status: the Turks of Qāzān.

Moreover, if we let our eyes range farther afield over the world of that day, we shall observe that, in the latter part of the seventeenth century of the Christian Era, the life of the ghetto was being lived by traders and handicraftsmen of Catholic or Protestant religion and Western origin, not only under an Ottoman régime in Galata and under a Muscovite régime in 'the Svoboda', but likewise under the Mughal rulers of India on the island of Bombay and under the Manchu rulers of China in the 'factories' at Canton² and under the Shoguns of Japan on the island of Deshima.

The ingenuity and the severity with which the Japanese penalized the Dutch have probably never been exceeded in the whole history of religious and racial discrimination. At Japanese hands, Dutch traders endured, for more than two centuries, humiliations worse than any that have been inflicted by Turk on Greek or by Gentile on

¹ 'Svoboda' means literally 'free-town'; yet, at the accession of Peter the Great, the social atmosphere of 'the Svoboda' was essentially the same as that of Galata or the Phanar in the same age.

² For a description of the conditions under which the Western merchants lived and traded, before their 'emancipation', in the 'factories' at Canton, see Morse, H. B.: *The International Relations of the Chinese Empire* (London 1910, Longmans Green), vol. I, chs. iv and xiv, esp. pp. 67-72:

'In 1757 an Imperial edict was issued making Canton the sole staple, and prohibiting all foreign trade at any other port. . .

'Regulations were made for the control of the foreigner, his ships and his trade. . . The more important among them may be summarised as follows:—

'1°. Ships of war must remain outside the river, and must not enter the Bogue.

'2°. Women must not be brought to the factories; nor could guns, spears, or other arms.

'3°. Hong merchants must not be in debt to foreigners.

'4°. Foreign traders must not engage Chinese servants.

'5°. Foreigners must not use sedan chairs.

'6°. Foreigners must not row for pleasure on the river. Three days in the month (on the 8th, 18th, and 28th) they might take the air at Fati (the flower gardens across the river) in small parties, under the escort of an interpreter, who was held, literally and personally, responsible for all their misdeeds.

'7°. Foreigners must not present petitions; if they have anything to represent, it must be done through the Hong Merchants.

'8°. "In the Hong merchants' factories where foreigners live, let them be under the restraint and control of the Hong merchants. The purchase of goods by them must pass through the hands of a Hong merchant; this was originally designed to guard against traitorous natives misleading them and teaching them. Hereafter the foreign merchants dwelling in the Hong merchants' factories must not be allowed to presume of their own accord to go out and in, lest they should trade and carry on clandestine transactions with traitorous natives."

'9°. Foreigners must not remain at Canton out of season, but, their goods sold and ships laden, must return home or go to Macao. . . .

These factories provided palatial accommodation for the foreign visitors, guests of the Empire, but they constituted in effect a gilded cage. The only ground for exercise available for the greater number was a square in front of the six factories in the middle, measuring about 500 feet by 300 feet.

Jew; and the reader of the story is left at a loss between admiration for the tenacity and disgust at the servility with which these 'Nordic' Protestant Occidentals held their ground and made their money, year in and year out, under conditions which were deliberately intended to make their residence in Japan intolerable. From A.D. 1641 to 1858,¹ the Dutch in Japan were rigorously 'kept in Coventry' on Deshima, a tiny island off the Japanese port of Nagasaki; and the privilege of being allowed to do their business in this insular ghetto, which was accorded to the Dutch alone among the Western nations, had to be purchased at the price of periodic self-abasement. One condition of the Hollanders' tenure of Deshima was that they should trample annually upon the Cross in the presence of a Japanese official: a ceremony which was only allowed to lapse in A.D. 1853 and was only abolished formally in 1856-7.² Another condition was that they should pay an annual visit of respect to the Shogun's capital at Yedo³ and should make themselves objects of public derision by cutting capers for the entertainment of the Court.⁴ This was the only occasion in the year on which the Dutch were permitted to stir outside their island prison-house. Yet the Dutch became so well resigned to these odious conditions of their residence in Japan that they left it to others to take the initiative in bringing the relations between Westerners and Japanese on to a footing of equality; and they showed no haste to follow, even after the Americans had led the way.⁵

The relations in which the Dutch lived with the Japanese, from the date of their confinement on Deshima in A.D. 1641 down to the

¹ On the 18th August, 1858, a Dutch-Japanese Treaty was concluded on the pattern of the American-Japanese Treaty which had been signed on the 31st March, 1854.

² See Murdoch, J.: *A History of Japan*, vol. iii (London 1926, Kegan Paul), pp. 616-17.

³ The present Tokyo.

⁴ In compelling the Dutch residents in Japan to demean themselves periodically in this public manner, the Japanese authorities were deliberately seeking to make the Western peoples and the Western Civilization ridiculous and contemptible in Japanese eyes. Without knowing it, they were adopting one of the expedients of Spartan statecraft. In ancient Lacedaemon, the Helots were periodically compelled to exhibit themselves to their Spartan masters in a maudlin condition, in order to confirm on both sides the impression that the Helots were an inferior race who were born to be the slaves of the Spartiates.

⁵ Aristotle (I think it is) says that the Overseers (*ἐφόροι*) [the chief executive officers of the Lacedaemonian Government, who were elected annually], when they take office, formally declare war on the Helots, in order to keep a free hand for killing Helots without blood-guiltiness. Altogether, the Spartans' treatment of the Helots was harsh and inhuman. For instance, they used to force them to drink quantities of neat wine and then bring them into the military messes, in order to give the young Spartiates an ocular demonstration of what drunkenness looks like. And they used to give them orders to sing songs and dance dances that were low and ludicrous, and not to sing or dance anything classical. On this account they say that in the sequel, during the Theban invasion of Laconia, when the Helot prisoners were told to sing something of Terpander's or Alcman's or Spendo the Laconian's, they begged to be excused, on the ground that their Spartan masters would not like it.

Plutarch: *Life of Lycurgus*, ch. xxviii. Cf. eundem, *Instituta Laconica*, No. 30. For Spartan institutions, see further Part III. A, vol. iii, pp. 50-79, below.

⁵ Murdoch, op. cit., vol. cit., p. 618.

reopening of Japan to Western commercial enterprise on normal conditions in the middle of the nineteenth century of the Christian Era, have their analogy in the relations between the ancient Greeks and Egyptians from the time when the Egyptian King Amasis (*regnabat circa 569-525 B.C.*) confined the Greek residents in Egypt to the 'treaty-port' of Naucratis in the middle of the sixth century B.C. down to the time when the Greeks were made masters of Egypt by Alexander the Great. During those two centuries the ancient Greeks in Egypt, like the modern Dutch in Japan, accepted the social humiliations of a pariah status in order to earn its commercial profits, as appears plainly from the following account of the Egyptian ritual of sacrifice in the fifth century B.C. from the hand of a contemporary Greek observer.

'When the Egyptians have slaughtered the sacrificial victim, they cut off its head. Thereupon, they flay the carcase and make a fearful imprecation over the head, which they then proceed to get rid of. Where they have a market with resident Greek traders, they simply get rid of it in the market by sale; but where there are no Greeks on the spot, they get rid of the head by throwing it into the river. The formula of imprecation which is recited over the head runs thus: "If any evil is impending over us who are making this sacrifice or over the whole Land of Egypt, into this head let it go!"'

The situation here depicted is a prosaic version, 'in real life', of the phantasy which Robert Louis Stevenson has played with in 'The Bottle Imp'. The sacrificial victim's head is an object charged with evil which the pious and sensitive Egyptian peasant is as anxious to get rid of as the unsophisticated Polynesian islander is anxious to get rid of the haunted bottle. The Greek trader, who is willing to take the unclean head off his Egyptian neighbour's hands any day for the sake of a pennyworth of profit, is a sordid counterpart of Stevenson's sailor-man, who cheerfully carries off the bottle for the sake of a dram and so disappears from the story. The light which this throws upon the status of the Greeks in Egypt in Herodotus's day is highly illuminating.

The Jews, Parsees, Nestorians, Monophysites, and Monotheletes

We have still to take note of the results of religious discrimination in the third of our three situations: that is, where the adherents of the penalized denomination represent a civilization which only survives as a 'fossil'. This situation need not be surveyed in great detail, since the phenomena are well known in themselves and do not differ in essence from those which we have observed in the two situations which we have examined already.

Let us glance at the various 'fossils' of the Syriac Society which

¹ Herodotus, Bk. II, ch. 39.

have been deposited, in successive social strata, during the much-interrupted and long-drawn-out course of Syriac history.¹ In the oldest stratum there are the Jews and the Parsees, who are relics of the Syriac Society as it was in its universal state, under the Achæmenian régime, before the Hellenic intrusion. In an intermediate stratum there are the Nestorians and the Monophysites, who are relics of two abortive attempts on the part of the Syriac Society to expel the intrusive Hellenism from its body social, and there are the Monotheletes, who are relics of an equally abortive attempt, on the part of the Hellenic Society *in extremis*, to retain its hold over a remnant of the Syriac World. In the most recent stratum there are the Shī'īs, who are the relics of a fissure in the Syriac World which was one of the consequences of the Hellenic intrusion² and which left its scar upon the Syriac body social even after the expulsion of Hellenism and the re-unification of the Syriac World had been successfully achieved, on the whole, in the 'resumption' of the Syriac universal state under the 'Abbasid régime and in the establishment of a 'totalitarian' Syriac universal church in the shape of Islam. The medium in which all these Syriac 'fossils' have been preserved is a religious medium; their religious idiosyncrasies, which have safeguarded their identities and perpetuated their existence in their fossil state, have also exposed them to religious discrimination at the hands of the alien societies in the midst of which they have managed to survive; this penalization has taken the usual form of exclusion from certain walks of life; and it has evoked the usual reaction in its victims. They have learnt to hold their own in any human environment in which they are allowed to exist on sufferance by excelling in those trades and handicrafts to which their activities have been compulsorily confined.³

¹ See I. C (i) (b), vol. i, pp. 90-2, above, and II. D (vii), pp. 285-8, below.

² For the partition of the Syriac World, over a span of some seven centuries, into an eastern section which had liberated itself and a western section which had failed to liberate itself from the Hellenic domination, see I. C (i) (b), vol. i, pp. 75-7, above.

³ In general, the reaction evoked by religious penalization among the representatives of a 'fossil' civilization seems to be more thoroughgoing than the reaction which the same challenge evokes among members of a civilization which is still a 'going concern'. The 'fossils' are apt to learn how to hold their own, under penalization, in any number of human environments successively or simultaneously, whereas the range of penalized religious minorities whose civilizations are still 'going concerns' is apt to remain within the ambit of some single society. Yet this broad distinction is by no means absolute. For example, the Levantines and the Greeks and the Gujaratis, who are members of the Western and the Orthodox Christian and the Hindu Society respectively, have shown themselves as versatile as the 'fossil' Jews and Parsees and Armenians and Nestorians and Maronites. Having served their apprenticeship in penalization under an Islamic régime—the Levantines and Greeks under the Ottoman Empire and the Gujaratis under the Muslim rāj in India—they have each extended their range into other environments: the Greeks into Western Europe and America; the Gujaratis into the colonial domains of the Western peoples in East and South Africa; the Levantines into Russia and India and the Far East. Conversely, the 'fossil' Copts have not made themselves at home outside Egypt any more than 'the Old Believers' have made themselves at home outside the Russian Empire or the Quakers outside the English-speaking World.

The Jews, for example, have overcome the social handicap which their religious idiosyncrasy entails by holding their own successfully, as traders and financiers, in a great variety of human environments. They have found a place for themselves first in the Syriac and Hellenic worlds and then in the Arabic and Iranic and Western worlds; and during the last few centuries they have kept pace with the expansion of Western Christendom until nowadays their activities and interests extend, as widely as those of our modern Western Society itself, over all the habitable lands and navigable seas on the face of the planet. The Parsees, for their part, have played the same role in the Hindu World as the Jews have played elsewhere; and they have shown the same elasticity and initiative as the Jews in using their special skill and experience to good effect in a variety of circumstances. Having acquired their expertise in trade and finance in a Hindu economic environment, they have managed to turn it to account in the utterly different economic environment which has been created in India by the impact of our Western Civilization; and their response to the challenge of this impact has been so much more effective than the response of the Hindus and Muslims among whom they live that they have profited by the ordeal of 'Westernization' to increase the economic ascendancy over their Indian neighbours which they already possessed before the challenge from the West was presented.

The Armenian Gregorian Monophysites have shown the same ability and adaptability in the same lines of activity as the Parsees and the Jews, until, at the present day, the Armenian merchant, like the Jewish financier, has become ubiquitous. In a narrower field, the Syrian Jacobite Monophysites have reacted like their Armenian co-religionists, while the Coptic Monophysites have held their own by acquiring a virtual monopoly of the local but lucrative business of farming the land-tax in their native Egypt.

The Monophysites started their career by holding out under the religious persecution which they had to suffer at the hands of an Orthodox Christian régime in the Roman Empire.¹ The Nestorians, for whom life in the Roman Empire was made impossible, transferred their head-quarters to 'Irâq and Iran, and held their own there, not only as men of business but as physicians, under the comparatively tolerant Sasanid and Umayyad and 'Abbasid régimes; and they did not perish in the social cataclysm which overwhelmed

¹ The Monophysites called their Orthodox Christian oppressors 'Melchites', that is to say 'Imperialists'—Orthodox Christianity (from which the Catholic Christianity of the West had not yet differentiated itself) being the established religion of the Roman Imperial régime under which the Monophysites had to live from the year 451, when the schism came to an open breach, down to the Arab conquest of the Roman provinces in Syria and Egypt towards the middle of the seventh century.

these regions at the break-up of the 'Abbasid Caliphate, when Baghdad was sacked, and the irrigation-system of 'Irāq put out of action, by the Mongols.

Before this catastrophe overtook their base of operations in the Syriac World, the Nestorians had already learnt to make themselves at home in other human environments at the ends of the Earth. In one direction, they made their way by sea along the west coast of India, beyond the farthest point to which the Parsee sphere of influence extended, and established a sphere of their own at the extremity of the Indian Peninsula, where their descendants or converts survive to this day as 'Saint Thomas's Christians' in Travancore. In another direction, they ventured out overland, beyond the farthest outposts of the Syriac World in Transoxania, into the heart of the great Eurasian Steppe, and made their way, from oasis to oasis, across the whole breadth of the wilderness until they emerged on the other side in China. These continental Nestorian pioneers who once won a footing in Central Asia and in the Far East have left no survivors. Yet, although in this sense they have been less successful than their co-religionists who followed the maritime route to India,¹ they have succeeded in making a greater mark upon the history of Mankind during their briefer day.

In the Far East the Nestorians were an active element in Society in the age of the T'ang (*imperabant* A.D. 618-907); and in the oases of the Eurasian Steppe they succeeded in converting the sedentary Turkish Uighurs and came near to establishing a distinctive Far Eastern Christian Civilization in the midst of the supremely adverse human environment of Nomadism.² It is true that this *tour de force* was abortive. The prospect was compromised in A.D. 737-41, when the oases of Transoxania, which had been the 'jumping-off ground' of the Nestorians in their overland venture, were permanently incorporated into the Arab Empire and were thereby transferred from the sphere of Nestorian Christendom to the sphere of Islam. The *coup de grâce* was delivered in A.D. 1203-6, when the semi-Nestorianized Nomads of the high steppe—the Karāyits³ and the more powerful and progressive Naimans—were successively defeated by the pagan chief of the Mongols, Chingis Khan. The Basin of the Orkhon, over which the Karāyits and the Naimans ranged at the time, was a key-position; and the conquest of its

¹ Even in India, Nestorianism has now lost its heritage; for, in the third quarter of the seventeenth century, the allegiance of Saint Thomas's Christians was usurped, under false pretences, by the Jacobite Monophysite Patriarch of Antioch. (See above, I. B (iii), vol. i, footnote 3 on p. 35.)

² This abortive Far Eastern Christian Civilization is discussed further in II. D (vii), on pp. 369-85, below.

³ Wang Khan, the prince of the Karāyits, was perhaps the historic original of the legendary 'Prester John'.

contemporary occupants was the first decisive step in Chingis' career. It is interesting to speculate what the future of Nestorian Christendom might have been if Wang Khan the Karāyit and not Chingis Khan the Mongol had won the day in A.D. 1203, or again if Tayan Khan the Naiman had won in 1206.

Even as it was, the Nestorian pioneers in the Nomadic World were able, thanks to their local monopoly of the elements of a higher culture, to hold their own after the overthrow of their Karāyit and Naiman patrons; and the Mongol conqueror took them into his service as scribes and accountants and recorders. For the best part of a century, while the centre of gravity of the Mongol Empire still remained on the Steppe and its seat of government in 'Prester John's' country at Qaraqorum, on the head-waters of the Orkhon, the archives of the Great Khan's Court were kept by Nestorian Christian secretaries in a Uighur Turkish dialect conveyed in a Syriac Alphabet. The Nestorians even made some distinguished Mongol converts. Hulāgū Khan, who sacked Baghdad and devastated 'Irāq (the original point of departure of the Nestorian Dispersion) in A.D. 1258, had a Nestorian wife; and Hulāgū's advance-guard, which captured Damascus in A.D. 1260, was commanded by a Nestorian general. It will be seen that the history of these Nestorian Christian Turkish Uighurs bears a certain resemblance to the history of the Orthodox Christian Greek Phanariots. They just missed their 'manifest destiny'; yet, in response to the challenge of penalization, they had developed certain special accomplishments which so enhanced their social value in the human environment in which they lived that they were virtually taken into partnership by the rulers of a great empire.¹

As for the Maronite Monotheletes, they have served an apprenticeship as clerks and traders in the Arabic World—especially in the fat land of Egypt which lies on the threshold of their own lean Lebanese fastness—and they have known, like the Jews and the Parsees and the Armenians, how to profit by the recent economic expansion of the Western Society over the face of the planet. The original field of Maronite commercial enterprise in Egypt now counts for less in the Maronite economy than the larger and more lucrative fields which the Maronites have found for themselves in the United States, in Latin America, and in the French Colonial Empire in West Africa. Similarly, the Ismā'īlī Shī'īs (*alias* Assassins *alias* Khwājas) have served an apprenticeship in India and have profited by 'the opening-up of Africa', where they have found a

¹ For the role played by the Nestorians in the Mongol Empire, see Vladimirtsov, B. Y.: *The Life of Chingis Khan* (English translation: London 1930, Routledge); and Barthold, W.: *Turkestan down to the Mongol Invasion* (English translation: London 1928, Luzac), pp. 386-92.

new field of enterprise in the British protectorates and colonies and mandated territories along the East-African seaboard of the Indian Ocean. At the opposite extremity of the Arabic World, the 'Ibādī Kharijites have held their own in a Sunnī environment as a mercantile class in the Maghrib.¹

So much for the reactions to the challenge of religious discrimination which can be observed among the 'fossils' of the Syriac Society. If we turn from these to the 'fossils' of the Indic Society, we can observe at least one reaction of the same nature to the same challenge among the Jains in India, who, together with the Hinayanian Buddhists in Ceylon, are relics of the Indic Society as it was before the Hellenic intrusion and who thus correspond in stratum to the Jews and the Parsees.² In Bengal and Assam at the present day, retail trade is a perquisite of Jain shop-keepers from the State of Marwar in Rājputāna.³

¹ For the 'Ibādīs, see Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot), pp. 303-4:

'Les Mzabites actuels sont assurément les descendants des ibadites rostémides, mais ils ont beaucoup changé en mille ans. Ils ont subi une transformation qui est fréquente dans la société orientale. Comme les Arméniens, comme les Parsis, comme les Juifs, qui ont l'exemple le plus éclatant, les Mzabites depuis l'écroulement de l'empire sont venus une sorte de tribu, ou plutôt de nation constituée par des siècles d'intermariage et spécialisée dans le maniement de l'argent, où, par développement atavique progressif, ils ont passé maître. Malgré l'éparpillement des individus dans toutes les villes de l'Algérie, partout où il y a un mouvement d'affaires possible, la cohésion de la nation mzabite, qui est incroyablement forte, son patriotisme hargneux et profondément méprisant, sont assurés uniquement par le lien religieux. Cette croûte protectrice religieuse s'est incessamment épaissie de siècle en siècle, elle s'est consolidée d'une armature compliquée de subtilités théologiques et de pratiques culturelles minutieuses.'

² For the 'fossils' of the Indic Society and their stratification, see I. B (iii), vol. i, p. 35, and I. C (i) (b), vol. i, pp. 90-2, above.

³ The remarkable resemblance, in ethos and occupation, between the Marwaris on the one hand and the Jews, Parsees, Armenians, and Maronites on the other is apparent in the following series of concordant testimonies from a number of independent authorities:

'Of the four well-known castes of India, viz., the *Brahmana*, the *Kshatriya*, the *Vaishya*, and the *Sudra*, the principal caste engaged in banking is the *Vaishya*. Among the *Vaishyas* are included the *Jainas*, *Marwaris* and *Chettis* who are the most important bankers in India. . . . The *Marwaris*, who are either *Jainas* or *Vaishnavites*, come from the Marwar State of Rājputāna and Central India. The majority are settled as permanent residents in Central India, but some of them travel from one place to another in search of business. Quite a number of *Marwari* merchants and bankers have migrated to trade centres like Bombay and Calcutta, whence they return home either when trade is slack or to perform religious ceremonies. . . . Very few of them are educated on Western lines and fewer still are acquainted with English commercial practice, but the way in which they conduct their business is remarkable. Gifted with a natural knack for trade, the *Marwari* boys quickly learn their arithmetic and accounting and start work in their family shops, where they soon pick up the necessary technique. To give an instance of their efficiency, while an English-educated graduate of an Indian university may take five minutes to work out on a piece of paper the compound interest on a given sum, the *Marwari* boy will get an answer correct to the nearest pie mentally, without the aid of pen and paper, in less than half a minute. Of course they are unfamiliar with the modern progress in their craft which is taking place in foreign countries, but, in their own sphere, they are by no means wanting in capacity.' (Jain, L. C.: *Indigenous Banking in India* (London 1929, Macmillan).)

'Almost every province has its peculiar trade-castes. The Marwaris of Rājputāna are, however, found almost everywhere, and in Assam they are of more importance than the natives of the province.' (Anstey, Vera: *The Economic Development of India* (London 1929, Longmans Green), quoting from the *Imperial Gazetteer*.)

'The Marwaris, whose home is in the Marwar State of Rājputāna, have an evil repute as usurers and skinflints. They are found in all the great trading cities, and much of the

The Ashkenazim, Sephardim, Dönme, and Marranos

Having now made some survey of the stimulating effects of religious discrimination over a wide field, we may pause, before proceeding to the next point in our study, in order to test the potency of this stimulus by our usual comparative method. The test can be applied here in two ways. We can compare the *éthos* displayed by members of a religious denomination when they are being penalized on account of their religion with the *éthos* of the same people, or their co-religionists, when the penalization has been partly or wholly remitted. We can also compare their *éthos* with the *éthos* of co-religionists to whom the stimulus of penalization has never been administered.

To start with the first of these two comparative tests, we can observe a series of gradations in the present *éthos* of diverse communities of Jews who are subject to penalization in different degrees of rigour or laxity.

At the present time, the Jews who display most conspicuously the well-known *éthos* which is commonly called 'Jewish', and which in Gentile minds is popularly assumed to be the hall-mark of Judaism always and everywhere, are the Ashkenazi Jews of Eastern Europe who, in Rumania and in the adjoining territories which used to be included in the so-called 'Jewish Pale' of the *ci-devant* Russian Empire, are still being kept morally, if not juridically, in the ghetto by the backward Christian nations among whom their lot is cast. The 'Jewish' *éthos* is already less conspicuous among the 'emancipated' Jews of Holland, France, Great Britain, and the United States; and when we consider how short a time has passed since the legal emancipation of the Jews took place, and how far from being complete their moral emancipation still is, even in the enlightened countries of the West, we shall not underrate the significance of the change of *éthos* which is already apparent here.

We may also observe that, among the emancipated Jews of the West, those of Ashkenazi origin, who have come from 'the Jewish Pale', still appear distinctly more 'Jewish' in *éthos* than the rarer

economic difficulties of the peasantry may be laid to their charge.' (Crooke, D.: *Natives of Northern India* (London 1907, Constable).)

'Marwari, literally a native of Malwa or Marwar. Most of the Marwaris found in Bengal are bankers and traders, usually Jains. The name gives no definite indication of caste. . . . In fact all traders from Rājputāna and the neighbouring districts are commonly called Marwaris.' (Risley, H. H.: *The Tribes and Castes of Bengal* (Calcutta 1891, Secretariat Press).)

'Marvari—a territorial name, meaning a native of Marwar. At times of census, Marwaris have been returned as a caste of Jains, i.e., Marwaris who are Jains by religion. The Marwaris are enterprising traders, who have settled in various parts of Southern India, and are, in the city of Madras, money lenders.' (Thurston, E.: *Castes and Tribes of Southern India* (Madras 1909, Government Press).)

See also the Report of the Calcutta University Commission (London 1917, H.M. Stationery Office, 3 vols.), vol. i, p. 25.

Sephardim in our midst, who have come originally from Dār-al-Islām; and we shall account for this difference by reminding ourselves of the diversity in the history of those two Jewish communities.

The Ashkenazim are descended from Jews who took advantage of the opening-up of Europe by the Romans and made a Jewish perquisite of the retail trade in the semi-barbarous Transalpine provinces. Since the conversion and break-up of the Roman Empire, these Ashkenazim have had to suffer doubly from the fanaticism of the Christian Church and from the resentment of the barbarians. A barbarian cannot bear to see a resident alien living a life apart and making a profit by transacting business which the barbarian lacks the skill to transact for himself; and the barbarian neophytes of Western Christendom have been humiliated by the superior ability and filled with envy by the superior prosperity of the indispensable Ashkenazi Jew. Acting on these feelings, they have penalized the Jew as long as he has remained indispensable to them, and have expelled him as soon as they have become capable of doing without him; and accordingly the rise and expansion of the Western Civilization since the days of Charlemagne and Otto I¹ have been accompanied by an eastward drift of the Ashkenazim from the ancient marches of the Roman Empire in the Rhineland to the modern marches of Western Christendom in 'the Pale'. In the expanding interior of Western Christendom, the Jews have been evicted from one country after another as successive Western peoples have attained a certain level of economic efficiency, while, in the advancing continental fringe, these Jewish exiles from the interior have been admitted and even invited into one country after another, in the initial stages of 'Westernization', as commercial pioneers, only to be penalized and eventually evicted once again as soon as they have once again ceased to be indispensable in their latest transitory asylum.

In 'the Pale' and in Rumania, this long trek of the Ashkenazi Jews from west to east across the Continent of Europe has been brought to a halt and their martyrdom has reached its climax; for here, at the meeting-point of Western Christendom with Russian Orthodox Christendom, the Jews have been caught and ground between the upper and the nether millstone. In the fullness of time, the local barbarian converts to Western Christianity on this extreme eastern verge of Western Christendom have acted after their kind. As they have gradually improved their own economic capacities, they have progressively penalized the Jews in their midst and have eventually begun to cast them out. This time,

¹ See II. D (v), pp. 166-74, above.

however, the evicted Ashkenazim have been unable to find a fresh asylum by trekking still farther eastward. Beyond the eastern boundary of 'the Pale', 'Holy Russia' has barred their way.

For the Jews, Russian soil has been forbidden ground from the time when Western and Russian Christendom originally made contact with one another on the Continent in the fourteenth century of the Christian Era right down to the Russian Communist Revolution of A.D. 1917. This barrier did not fall when Russia opened her doors to the Western Civilization in the generation of Peter the Great; and it did not fall thereafter when the eastern marches of Western Christendom were incorporated politically into the Russian Empire. The old frontier between Muscovy and the United Kingdom of Poland-Lithuania, which the Partition of Poland obliterated for the Christian subjects of the Czar, remained in force for the Jew as an eastern limit which he was absolutely forbidden to pass. It was fortunate indeed for the Ashkenazim that by this time the leading nations of the West, which had been the first to evict the Jews in the Middle Ages, had risen to a height of economic efficiency at which they were no longer afraid of exposing themselves to Jewish economic competition in a free field with no favour. The emancipation of the Jews in the West came just in time to give the Ashkenazim of 'the Pale' a new western outlet when their old eastward drift was brought up short against the blank wall of 'Holy Russia'. During the past century, the tide of Ashkenazi migration has been ebbing back from east to west: from 'the Pale' and Rumania into England and the United States. It is not to be wondered at that, with these antecedents, the Ashkenazim whom this ebb-tide has deposited among us should display the so-called 'Jewish' *ethos* more conspicuously than their Sephardi co-religionists whose 'lines' have 'fallen'¹ in comparatively pleasant places.

To the author of this Study, the spiritual and political duress under which the Ashkenazim have had to live their life in 'the Pale' was brought home by the following two anecdotes which were recounted to him in 1919, during the Peace Conference of Paris, by Dr. Chaim Weizmann in order to explain why this great statesman and scientist—the most distinguished member of the Ashkenazi community in his generation—had become a convert to Zionism.

The first anecdote was this. In Dr. Weizmann's boyhood, at Vilna, there was a young Jewish sculptor of great promise who was expected to become one of the historic exponents of the Jewish culture. The young man's promise was fulfilled, but Jewry's hope was disappointed; for the *chef d'œuvre* in which this Jewish artist eventually gave expression to his genius was a statue of the Russian

¹ Psalm xvi. 6.

Orthodox Christian Czar Ivan the Terrible! Under the duress of 'the Pale', Jewish genius had been perverted to the glorification of Jewry's oppressors. It was as if the *chef d'œuvre* of Jewish literature in the second century B.C. had not been the Book of Ecclesiastes or the Psalms but some panegyric, in the Isocratean manner, upon Antiochus Epiphanes. Truly, that statue of a Russian Czar by the hand of a Vilna Jew was as great an eyesore for Jewish eyes as the statue of Zeus which the Seleucid once set up in the Temple of Yahweh at Jerusalem: an 'abomination of desolation standing where it ought not'.¹

Dr. Weizmann's second anecdote was an incident which had happened to himself as a grown man before his migration from Vilna to Manchester. A piece of urgent business made it indispensable for him to break the Russian law then in force, under the Czardom, by trespassing beyond the eastern boundary of 'the Pale' in order to have a personal meeting with a friend in Moscow. As a precaution against the vigilance of the Russian police, it was arranged beforehand that Dr. Weizmann should travel from Vilna to Moscow in a train arriving at nightfall, do his business in his friend's house during the night, and return to Vilna by a train leaving Moscow before dawn; but this arrangement fell through. For some reason, the friend whom Dr. Weizmann had come to see was unable to keep the appointment; and Dr. Weizmann found on inquiry that there was no return-train to Vilna earlier than the train which he had been intending to take. How should he pass the night hours? To engage a room in a hotel would be tantamount to delivering himself up to the police. Dr. Weizmann solved the problem by hiring a cab and driving round and round the streets of Moscow until the hour of his train's departure. 'And that', he concluded, 'was how I had to pass my time on my one and only visit to the capital of the Empire of which I was supposed to be a citizen!'

Such anecdotes as these sufficiently explain the *ethos* of the Ashkenazi immigrants from 'the Pale' into the more enlightened countries of the modern Western World; and the less highly accentuated 'Jewishness' of the *ethos* which we observe among the Sephardi immigrants from Spain and Portugal is explained by the antecedents of the Sephardim in Dār-al-Islām.

The representatives of the Jewish Dispersion in the dominions of the Sasanidae and in those provinces of the Roman Empire which ultimately fell to the Arabs and not to the North European barbarians found themselves in a happy position compared with their unfortunate co-religionists in the Rhineland. Their status under the régime of the 'Abbasid Caliphate was certainly not less favourable

¹ Mark xiii. 14; Matthew xxiv. 15; Luke xxi. 20; Daniel ix. 27.

than the status of Jews to-day in those Western countries where the Jews have been 'emancipated'; and it did not become intolerable when the Caliphate broke up and the Syriac Society finally dissolved in the interregnum from which the 'affiliated' Arabic and Iranic societies subsequently emerged. The historic calamity of the Sephardim was the transfer of the Iberian Peninsula from the domain of the Syriac to the domain of the Western Civilization: a transfer which began towards the close of the tenth century of the Christian Era and was consummated, some five centuries later, in the conquest of Granada by Ferdinand and Isabella. The change of régime was effected, from beginning to end, by force of arms;¹ and the local calamity which this violent social change entailed for the Sephardim, in common with the Muslimin among whom they lived, was extreme in its severity. The Muslims and the Jews who came under Christian rule in the Iberian Peninsula were not offered the choice of retaining their old religion and culture under the new régime at the price of penalization, as the Ashkenazim were permitted to live under Western Christian domination on the other side of the Pyrenees or the Orthodox Christians and the Levantines under Muslim domination in the Ottoman Empire. In the Iberian Peninsula, the conquered communities had to choose between the three alternatives of annihilation, expulsion, and conversion. In Spain, the choice was presented to the Jews during the century which began with the great persecution of A.D. 1391 and ended with Ferdinand and Isabella's edict of expulsion in 1492. Let us glance at the latter state of those Peninsular Sephardim who saved their lives in one of the two alternative ways and whose posterity therefore survives down to this day.

Peninsular Sephardim who preferred to go into exile rather than to be received into the Roman Catholic Church—or rather than to remain forced and insincere converts to the Roman Catholic faith—found asylum among the enemies of Catholic Portugal and Spain: the Portuguese Sephardim in Protestant Holland, the Castilian Sephardim in Muslim Turkey, and members of both communities in tolerant Tuscany.² The 'Osmanlis gave asylum to the Jewish refugees from Castile for several reasons. They felt the normal

¹ For the effect of this warfare upon the Iberian Christians, see II. D (v), pp. 203–6, above.

² For the eventual dispersion abroad of the descendants of the Sephardi Jews who were forcibly converted in Castile in A.D. 1391 and in Portugal in A.D. 1497, see Roth, C.: *A History of the Marranos* (London 1932, Routledge), especially chapters viii–xi. The history of the Peninsular Sephardi community which was founded at Leghorn in A.D. 1593 (see op. cit., pp. 214–19) by Spanish and Portuguese crypto-Jewish refugees who were able to return openly to their ancestral faith under the Tuscan Government's protection, may be compared with the history of the autonomous Greek community which was founded in the last quarter of the eighteenth century at Ayvalık under the aegis of the Ottoman Pādīshāh. (See II. D (ii), p. 40, footnote 1, above.)

human sympathy for the victims of their enemies (and the United Kingdom of Castile and Aragon was the principal enemy of the Ottoman Power in the Mediterranean); they inherited the normal Muslim tradition of liberality towards Jews; and they had a special *raison d'état* for welcoming Jewish immigration into their dominions at this juncture.

While the Castilians had been rounding off their conquests and confirming their supremacy in the Iberian Peninsula, the 'Osmanlis had been rounding off their own conquests in the Balkan Peninsula and Anatolia and were anxious to confirm their supremacy likewise in their own domain. They were not, however, at liberty to confirm it by cutting the Gordian Knot in the Occidental fashion; for, in the eyes of the Islamic Law, Jews and Christians as well as Muslims had certain fundamental and inalienable rights in virtue of their common belief in the One True God. The recipients of the Torah and the Bible, as well as the recipients of the Qur'ān, were 'People of the Book'; and to non-Muslim 'People of the Book' who had succumbed to Muslim arms the Muslim conqueror was instructed to offer a less cruel choice than the three alternatives which were offered to vanquished Muslims and Jews by the Christian Church Militant in Spain. His Catholic Majesty cut the knot by giving any vanquished miscreants who did not conveniently dispose of themselves by fighting to the death a choice between conversion and expulsion. The Muslim conqueror must give them the choice between conversion and toleration—the condition of toleration being the acceptance of a status of inferiority and the payment of a special super-tax. In other words, the Muslim conqueror was bound by the Islamic Law to face the problem of having permanently under his rule an alien population which was subject to penalization but not devoid of rights. This problem was a severe test of statesmanship in a situation in which the *dhimmis* were the majority and the Muslims the minority; and this was the situation in which the Ottoman Pādishāh found himself after the Ottoman Empire had been rounded off by Ferdinand and Isabella's older contemporary Mehmed the Conqueror. Ottoman statesmanship sought to find a solution for its problem by giving the Castilian Jewish refugees asylum and taking them into partnership.

The 'Osmanlis were confident of their own ability to fill the roles of rulers and soldiers and peasants, in which the immigrant Castilian Jews would have neither the power nor the inclination to compete with them. On the other hand, they knew themselves to be incompetent to supplant the conquered Greek Orthodox and Levantine Catholic Christians in the field of handicraft and trade; and at the same time they were afraid that these tolerated but unreconciled

native subjects might remain too strong for the safety of the Ottoman Commonwealth if even in this limited field they were permitted to retain a monopoly. Accordingly, the Ottoman Government not only gave the Castilian Jews asylum in its dominions but carefully planted them in the chief commercial centres—Salonica, Adrianople, and Constantinople itself—with the intention that these Jews should take the lion's share in the one field of social activity which the 'Osmanlis themselves were unable to occupy. This intention was fulfilled. The Sephardim, whose ancestors had made themselves past-masters in this field some fifteen or twenty centuries before the Christian subjects of the 'Osmanlis were confined to it, were easily able, with the Ottoman Government's political support, to draw the main threads of Near Eastern commerce into their own hands. Under the Ottoman régime, they prospered commercially in the Near East as they had once prospered commercially in the Iberian Peninsula. At the same time—and this is the significant point for our present purpose—they developed under the Ottoman régime a quite different *éthos* from the Jewish *éthos* as we know it in the West, because the treatment which they received at the 'Osmanlis' hands was quite different from the treatment which Jews have customarily received at the hands of Westerners.

The psychological effect of four centuries of the Ottoman régime upon the descendants in the Near East of these Sephardi refugees from Castile was once brought home to the writer of this Study by an incident which came under his personal observation.

One day in August 1921, some eight years and more after Salonica, with its Sephardi population of eighty thousand souls, had passed by conquest out of Ottoman jurisdiction into Greek, I found myself travelling by train from Salonica to Vodena in the same carriage with three Sephardi school-teachers going on a holiday and one Greek officer going to rejoin his regiment. The holiday-makers—two girls and a man—were in high spirits, and they gave vent to their mood by breaking into song. They sang in French: the 'culture language' in which the modern Near Eastern Jew has found the necessary supplement to his hereditary Castilian vernacular. After they had been singing for some time, the Greek lieutenant broke his own silence. 'Won't you sing in Greek for a change?' he said. 'This country is part of Greece now, and you are Greek citizens.' But his intervention had no effect. 'We prefer French' the Jews answered, politely but firmly, and fell to singing lustily in French again, while the Greek lieutenant subsided. There was one person in the carriage, however, who was even more surprised at the Jewish teachers' reply to the Greek officer than the Greek himself, and that was the Frankish spectator. Seldom, he reflected,

would a Jew have shown such spirit in such circumstances in France or England or America. The incident bore witness to the relative humanity with which the Jews in the Ottoman Empire had been treated by the 'Osmanlis; and it also had a wider and more interesting significance. It was evidence that the Jewish *êthos* was not something ineradicably implanted by Race or something indelibly ingrained by Religion but was a psychic variable which was apt to vary in response to variations in Gentile behaviour in different times and places.

This inference is supported by other varieties of Jewish *êthos* within the Sephardi community itself. For instance, there is the *Dönme*:¹ a fraction of the immigrant Castilian Jewish community in the Near East which has been in communion with Islam for some two and a half centuries.² These *ci-devant* Jews have parted company with their former co-religionists without wholly merging themselves in the fraternity of Islam. They have remained in some degree 'a peculiar people', neither fish, flesh, nor fowl. Nevertheless, their *rapprochement*, so far as it has gone, towards the ruling element in the society in which they live has been accompanied by a visible diminution of the distinctively 'Jewish' element in their *êthos*. *A fortiori*, in the Marranos—that is, the descendants of those Peninsular Sephardim who were induced or compelled some four or five centuries ago to be received into the Roman Catholic Church rather than go into exile³—the distinctive Jewish characteristics have been attenuated to vanishing point.

There is reason to believe that in Spain and Portugal to-day there is a strong tincture of the blood of these Jewish converts in Christian veins, especially in the upper and middle class. Yet the most acute psycho-analyst might find it 'difficult, if samples of living upper and middle class Spaniards and Portuguese were presented to him for examination, to distinguish those who had from those who had not a Jewish strain in their physical race. Indeed, in most cases our psycho-analyst would have no psychic data here to go upon in attempting to separate the sheep from the goats; for in most cases he would be unable to detect in his subjects any sense, either conscious or sub-conscious, of their Jewish antecedents, even where

¹ 'Dönme' is a Turkish verbal noun meaning 'conversion'.

² The *Dönme* community consists of the descendants of those ex-Castilian Ottoman Jews who followed Sabbatai Zevi: a Smyrniot Jew who proclaimed himself Messiah in A.D. 1648. In 1666, the year in which the *Smr* not Messiah was to enter into his kingdom, the Ottoman Government, which had left him completely at liberty to propagate his claims for eighteen years, at last took the precaution of internment him; and thereafter Sabbatai obtained his release by making a *volte face* and proclaiming his conversion to Islam, in which his example was followed by his disciples. For Sabbatai Zevi's career, see Kastein, J.: *The Messiah of Smyr: Sabbatai Zevi* (London 1931, Lane).

³ A genuine choice between conversion and expulsion was offered to the Castilian Jews between A.D. 1391 and A.D. 1492. On the other hand, in A.D. 1497, the Portuguese Jews were coerced into apostasy wholesale. (See Roth, *op. cit.*, pp. 55-62.)

the Jewish physical strain was actually present. The forced converts themselves and the first few generations of their descendants may have remained crypto-Jews; the next few generations may have preserved some memory of their ancestors having only been Gentiles and Catholics in outward form; but, when once the traditional social barriers had been broken down by the formal act of conversion, the perpetual intercourse and repeated intermarriage between the posterity of the converts and the hereditary members of the society into which their forefathers' act had initiated them must gradually have produced its full psychological effect among the great majority of the *ci-devant*-Jewish families. With the passage of time, a generation must have arrived in which the Jewish consciousness and the Jewish *éthos* were totally extinct.¹

Thus, in Jewry, we find a graded sequence of types—Ashkenazi, Sephardi, Dönme, crypto-Jew, and *ci-devant*-Jewish Catholic—in which the Jewish *éthos* varies in intensity through all the degrees from maximum to vanishing point; and we observe that these variations in the intensity of the Jewish *éthos* correspond to variations in the severity of the penalization to which Jewry has been subjected by the Gentiles. The distinctive *éthos* of the penalized religious denomination becomes less and less sharply accentuated as the penalization is progressively remitted; and this social law is not valid only for the Jews. Its operation can be illustrated from the history of other penalized sects whose reactions we have examined above.

Nabobs and Sahibs

Examples are afforded by the history of those Western Christian traders who have lived the ghetto-life, under alien régimes, in the

¹ This final extinction of the Jewish consciousness and *éthos* in the Marranos is of surprisingly recent date—to judge by a remarkable passage in chapter xi of George Borrow's *The Bible in Spain*. For the author arrived off the coast of the Peninsula on the 10th November, 1835, and wrote the preface to his book on the 26th November, 1842, so that the incident recorded in chapter xi must have occurred between these two dates—that is to say, if the tale is to be taken literally as the record of an actual experience and is not to be interpreted as a literary artifice for conveying the 'feel' of a crypto-Jew's existence as Borrow had reconstructed this in imagination from a book-study of the history of the Marranos in earlier centuries. Be that as it may, Borrow's description of his alleged encounter and conversation with the mysterious Abarbenel on the road to Talavera is eminently worth reading; and, since the passage is far too long to quote in full, and far too fine a piece of literary art to be quoted at all except *verbatim*, the writer of this Study must be content to refer his readers to it and urge them to re-read it for themselves. The authenticity of Borrow's alleged encounter with a living Marrano in Spain appears by no means incredible in the light of the well-authenticated fact that, in Portugal, a rural population of Marranos has come to notice, and has even begun to return publicly to its ancestral faith, since the overthrow of the Monarchy and establishment of the Republic in A.D. 1910. (See Roth, *op. cit.*, Epilogue.) The survival of crypto-Jewish communities in the Iberian Peninsula over a span of more than four centuries is amazing; and our amazement will be increased when we consider that, throughout the sixteenth and seventeenth centuries of the Christian Era, this subterranean Jewish community was being weakened all the time by a steady drain of its more active and enterprising members, who lost no opportunity of emigrating in order to return publicly to their ancestral religion in a Dutch or Tuscan or Ottoman asylum.

Ottoman Empire and Russia and India and the Far East. These formerly penalized Western Christian residents in Oriental countries have all been 'emancipated' from their ghettos successively in the course of the last two and a half centuries: the 'Niemci' from the Muscovite 'Svoboda' in the time of Peter the Great; the French and English from their 'factories' on the coasts of India after the death of Awrangzib; the Franks from their segregated quarters in the *Échelles du Levant* after Bonaparte's landing in Egypt in A.D. 1798; the 'South Sea Barbarians' from their 'factories' at Canton after the Anglo-Chinese 'Opium War' of A.D. 1839-42; the Dutch from Deshima after the visit of Admiral Perry's squadron to Yedo Bay in A.D. 1853. The nature and manner and extent of the 'emancipation' have been different in each case; but there is one thing that can be said of all these cases with equal truth. In all the cases, a more or less uniform 'Jewish' *êthos*, which these Western residents under an alien régime had developed in response to a more or less uniform penalization, has faded or vanished altogether as the social conditions conducive to it have been mitigated.

The most astonishing case is that of the servants of the English East India Company in India. In this case, the reversal of fortune was rapid and extreme. Within the span of less than a century, the Company's servants rose from being for the most part clerks and salesmen who were allowed to do their business on sufferance on the fringe of 'the Great Mogul's' dominions until they found themselves the undisputed masters of India and acknowledged heirs of 'the Great Mogul' himself, who only retained a shadow of his hereditary sovereignty as the Company's protégé and pensioner. The change of *êthos* which the English in India underwent in the course of this century was fully commensurate with their change in status. The 'Nabob' of the eighteenth century became the 'Sahib'¹ of the nineteenth. In the character of Jos Sedley, Thackeray has simply given a touch of caricature to a life-like portrait of the 'Anglo-Indian'² as he continued to be until after the turn of the century. Yet already the revolutionary change of circumstances in India had made Thackeray's picture an anachronism. The Battle of Waterloo, which is signalized in fiction by Jos Sedley's headlong flight, was won as a matter of historical fact by a 'sepoxy general'; and in the

¹ This title 'Sahib', which has come to be applied to the Englishman in India, is an Arabic word which, in its classical usage, means 'a companion of the Prophet Muhammad'. The application of a title with this connotation to the infidel son of a shopkeeper shows how completely 'the nation of shopkeepers' was transfigured in the Indian imagination when it succeeded the Mughals in the role of being the ruling race; and this, in turn, shows how profound a change must have taken place in the *êthos* of the English in India themselves, since it is evident that the Indians have always taken us approximately at our own valuation.

² 'Anglo-Indian' in the original sense of English resident in India, and not in the latter-day usage of the name as a euphemism for 'Eurasian'.

decade of the Sikh Wars, when Thackeray was writing *Vanity Fair*,¹ the typical servant of the East India Company was no longer a chicken-livered Jos nor even a ruffianly Clive, but an evangelical soldier or administrator of heroic build: a John Lawrence or a John Nicholson.

Emancipated Nonconformists

Another illustration of our point is offered by the history of the Huguenots. In France down to this day the Huguenots continue to display the distinctive *éthos* of a penalized religious denomination, in spite of the fact that they have been 'emancipated' officially since the time of the Revolution. In their native land, they still tend to hold aloof from public life and to devote themselves with conspicuous success to private business. On the other hand, the descendants of those Huguenots who emigrated at the close of the seventeenth century from France to the Protestant countries have been subject to no such inhibition; and in the annals of modern England and Germany and South Africa the descendants of Huguenot refugees have distinguished themselves in every walk of life, not only in business but in the army and in the civil service and in politics. Lasalle and Ledebour, Joubert and Dufour-Féronce are examples of Huguenot names which have made a mark in German and South African history.

In England, the *éthos* of the non-Anglican Protestant denominations shows signs of a corresponding modification—not, in this case, in response to more favourable conditions which have been secured by migration into an alien environment, but in response to an improvement of conditions at home. 'The Nonconformist Conscience' has lost some of its sharpness since Nonconformity has ceased to be incompatible with membership in the English Governing Class, while on the other hand the Quaker Conscience has led the members of the Society of Friends to pursue their old ideals in a wider field of social action as the religious disqualifications which once circumscribed their activities have been removed. In both these otherwise dissimilar cases, the remission of a previous penalization has had one common effect. It has resulted in both the Quakers and the Nonconformists ceasing to be 'peculiar peoples'. It has led both to come out of their shells in order to live—for good or not for good, as the case may be—the ordinary life of the world around them.²

¹ *Vanity Fair* was written during the years 1846–8.

² This tendency, which was at work all through the nineteenth century, was brought to a head by the General War of 1914–18, in which the Nonconformists on the whole identified themselves with the policy and outlook of the Governing Class while the Quakers found themselves moved to uphold their own unchanged ideals in public action.

Emancipated Ra'iyeh

In the Orthodox Christian World, the same point is illustrated by the diversity of *êthos*, in post-war Greece, between two sections of the population: on the one hand, the indigenous inhabitants of 'the Old Kingdom', within the frontiers as they stood before the wars of 1912-22; and, on the other hand, the new citizens whom the present Greek Republic has acquired partly through the transfer of Macedonia and Western Thrace, with their Greek inhabitants, to Greek from Ottoman sovereignty, and partly through the influx into Greece of Greek refugees from Eastern Thrace and Western Anatolia after the failure of the Greek Government to wrest these latter territories from Turkish hands. At the time of writing, some ten years after the Peace Settlement of Lausanne, the contrast between these two elements in the population of Greece is still conspicuous. It is, in fact, the most important feature of diversity in the social and political life of the country.

The old citizens and the new citizens of the Greek Republic are conscious, on both sides, of a certain *mésintelligence* with one another. Yet the differentiation of *êthos* out of which this tendency towards misunderstanding arises cannot be much more than a century old; for, little more than a century ago, before the Greek Revolutionary War of 1821-9, the whole of the present territory of Greece, with the insignificant exception of the Ionian Islands, was still embraced within the Ottoman Empire, so that in that generation the influence of the Ottoman environment was operative upon the ancestors of the present old citizens and new citizens of Greece alike. The present difference of *êthos* is to be explained by the fact that the new citizens have remained under the Ottoman régime down to the present generation, while the old citizens have been exempt from the Ottoman régime for some three or four generations past. Instead of remaining members of a penalized religious denomination under an alien ascendancy, they have been living, during these last three or four generations, as citizens of a Greek national state on the Western pattern. In this new environment, they have lost much of the *êthos* of the old-fashioned Ottoman *ra'iyeh* and have acquired something of the *êthos* of the modern Occidental. Though the time has been short, the psychological change which has been induced by the new conditions of the human environment has been sufficiently great to establish a perceptible psychological barrier between the two sections of the Greek people now that they have been

on a grand scale. The blunting of 'the Nonconformist Conscience' is reflected in the post-war decay of the Liberal Party. The entry of the Quakers into public life is proclaimed by the mighty works of philanthropy which have been performed in every part of the World by the Society of Friends since 1914. In these works, the Inner Light has made itself outwardly manifest. *Si monumentum requiris, circumspecte.*

reunited in a single commonwealth after little more than a century of segregation.

Assimilationists and Zionists

This effect of citizenship in a Greek national state upon the descendants of the Greek *ra'iyeh* of the old Ottoman Empire has a bearing on a modern movement in Jewry: the movement called Zionism.

The ultimate aim of the Zionists is to liberate the Jewish people from the peculiar psychological complex induced by the penalization to which they have been subject for centuries in the Gentile World. In this ultimate aim, the Zionists are at one with the Assimilationist School among the 'emancipated' Jews in the enlightened countries of the West. They agree with the Assimilationists in wishing to cure the Jews of being 'a peculiar people'. They part company with them, however, in their estimate of the Assimilationist prescription, which the Zionists reject as inadequate for coping with the malady.

The ideal of the Assimilationists is that the Jew in Holland, France, England, or America should become a Dutchman, Frenchman, Englishman, or American, as the case may be, 'of Jewish religion'. They argue that there is no reason why a Jewish citizen of any of these enlightened countries should fail to be a completely satisfied and satisfactory member of Society just because he happens to go to synagogue on Saturday instead of going to church on Sunday. To this argument, the Zionists have two replies. In the first place, they point out that, even if the Assimilationist prescription were capable of producing the result which its advocates claim for it, it is only applicable in the enlightened countries in which the Jews have been granted 'emancipation'. It offers no solution for the Jewish problem in Eastern Europe, where the régime of the ghetto still virtually prevails and where bona fide 'emancipation' is not in prospect.¹ In the second place—and this is the more trenchant of the two Zionist attacks upon the Assimilationist position—the Zionists contend that, even in the most enlightened Gentile community in the World, the Jewish problem cannot be solved by a Gentile-Jewish 'social contract' under which the Gentile 'emancipates' the Jew and the Jew 'assimilates' himself to the Gentile. This attempt at a contractual solution is vitiated, in the Zionists' view, by the false

¹ This passage was written before the 'Aryan' outbreak against the Jews in Germany which accompanied the German National-Socialist Revolution of 1933. This appalling recrudescence of militant anti-Semitism in one of the leading countries of the Western World still further strengthens the already strong Zionist case. For the German outbreak of 1933 can only be compared—in its brutality, its hysteria, and its thoroughness—with the Castilian outbreak of A.D. 1391. If this could happen in the present age in a country in which the Jews had long since been emancipated, then where in the World can the Jewish Diaspora feel itself really secure?

premise which vitiates the classical 'social contract' theory of Rousseau. It presupposes that human beings are social atoms and that a human society is an aggregate of these atoms which is held together by a legal nexus between the individuals as, in the physical universe, an aggregation of physical atoms is held together by the laws of Physics according to the 'classical' physical science of the nineteenth century. The Zionist, arguing *ad hominem*, insists that the Jew, at any rate, is not in fact an autonomous individual who can make and unmake his social relations as he pleases. To be a Jew is to be a human being whose social environment is Jewry. It is an essential part of the Jew's individuality that he is a member of the living Jewish community and an heir to the ancient Jewish tradition. He cannot cut off his Jewishness and cast it from him without self-mutilation; and thus, for the Jew, an emancipation-assimilation contract with a Gentile nation has the same kind of consequence as the legal instrument which turns a free man into a slave. It 'deprives him of half of his manhood'.¹ A Jew who, by process of emancipation and assimilation, attempts, in a social contract with his Gentile neighbours, to turn himself into a Dutchman or a Frenchman or an Englishman or an American 'of Jewish religion' is simply mutilating his Jewish personality without having any prospect at all of acquiring the full personality of a Dutchman or whatever the Gentile nationality of his choice may be.

Thus, in the Zionist view, the emancipation and assimilation of the Jew as an individual is a wrong method of pursuing a right aim. Genuine assimilation is indeed the true solution for the Jewish problem and ought therefore to be the ultimate goal of Jewish endeavours; but the Jews can never escape from being 'a peculiar people' by masquerading as Englishmen or Frenchmen. If they are to succeed in becoming 'like all the nations',² they must seek assimilation on a national and not on an individual basis. Instead of trying to assimilate individual Jews to individual Englishmen or Frenchmen, they must try to assimilate Jewry itself to England and France. Jewry must become a nation in effective possession of a national home, and this on the ground from which the historic roots of Judaism have sprung. When a new generation of Jews has grown up in Palestine in a Jewish national environment, then, and not till then, the Jewish problem will be solved by the reappearance in the World of a type of Jew which has been almost non-existent for the past two thousand years: a Jew who has genuinely ceased to be 'not as other men are'.³

Though the Zionist Movement as a practical undertaking is only

¹ See the ancient Greek proverb quoted in the present section on p. 214, above.

² 1 Samuel viii. 5 and 20.

³ Luke xviii. 11.

half a century old, its social philosophy has already been justified by results. In the Jewish agricultural settlements that have been founded in Palestine within the last fifty years, the children of the ghetto have been transformed out of all recognition into a pioneering peasantry which displays many of the characteristics of the Gentile European colonial type in the New World. The Zionists have made no miscalculation in their forecast of the effect which the establishment of a Jewish national home in Palestine would have upon Jewry itself. The tragic misfortune into which they have fallen, in company with the Mandatory Power, is their inability to arrive at an understanding with the existing Arab population of the country: prior claimants and possessors who have been roused to resistance by the very spirit of Western Nationalism which has been the inspiration of Zionism itself.

Ismā'īlīs and Imāmīs

Lastly, we may take note of the difference between the *Ismā'īlī* *Shī'īs* of India, who display to-day, as strongly as ever, the distinctive characteristics of penalized religious denominations, and the *Imāmī Shī'īs* of Persia, whose *êthos* at the present day is at the opposite extreme of the psychological gamut. In the modern Western World, the antithesis to the characteristic *êthos* of penalized religious denominations is the spirit of Nationalism; and the closest indigenous analogue of Western Nationalism which Western observers have detected in the modern Islamic World is the spirit of the *Imāmī Shī'ī* Persians.¹ Indeed, the modern Persians may be called a nation and modern Persia a national state without any flagrant misapplication of our Western terminology. In other words, the spirit of *Imāmī Shī'ism*, which is the established religion of modern Persia, differs at the present day from the spirit of *Ismā'īlī Shī'ism* about as widely as the spirit of France or England or any of the other territorial nations of the West differs from the spirit of Jewry. Yet, as a matter of historical fact, the present differentiation of the *Imāmī êthos* in Persia from the *Ismā'īlī* in India is of recent date, like the differentiation in *êthos* between the Jewish agricultural colonist in Palestine and the Ghetto-Jew of 'the Pale' or between the Greek citizen of Greece and the Greek *ra'iyyeh* of the Ottoman Empire.

¹ In recent times, of course, the Islamic Society has become infected with the virus of Western Nationalism itself, and this infection has not attacked the Persians as violently as it has attacked certain other Islamic peoples: for instance, the Egyptians and, above all, the 'Osmanlis. This Western type of Nationalism in the Islamic World is, however, something exotic; and if we search for a counterpart of Western Nationalism in the Islamic Society as that society was before the process of 'Westernization' began, then we shall find this counterpart among the Muslims of Persia and not among those of the Ottoman Empire. This point has been touched upon already in I. C (i) (b), Annex I, vol. i, p. 393 with footnote 1, above.

Little more than four centuries ago, the Imāmīs, like the other sects of the Shī'ah, were 'dispersed abroad' among a Sunnī majority in Persia, Bahrayn, Hasā, Syria, and elsewhere,¹ and in this situation they duly displayed, like other Shī'īs, those characteristics of a penalized religious denomination with which we have now become familiar. The situation of the Imāmī sect was revolutionized at the beginning of the sixteenth century of the Christian Era, within the short span of a single generation, by the life-work of one man: Ismā'il Shāh Safawī. This militant apostle of Imāmī Shī'ism changed the destinies of his faith by the victories of his sword. Imāmī Shī'ism, as Shāh Ismā'il found it, was the persuasion of a scattered and persecuted sect; as he left it, it was the established church, and very nearly the exclusive religion, of an empire which embraced the whole of Persia.² In modern Persia, from Shāh Ismā'il's time onwards, the Imāmīs have ceased to be the 'peculiar people' which the Ismā'ilīs have continued to be in India. While these other Shī'īs have remained what they always were, the Imāmīs in Persia have become *the* people of a great country. They have become the Persian nation, which is master in its own house and is free to practise its national religion without being penalized by any man. In the course of four centuries, this profound change of circumstance has produced the profound change of *êthos* to which we have drawn attention above. There were, however, certain Imāmī communities—for example, those in Syria and in Hasā—whose homes were too distant from Shāh Ismā'il's base of operations to be included in the empire which he carved out; and these Imāmī Shī'īs beyond the borders of Persia have never ceased to display the *êthos* which all Imāmīs formerly displayed in common with the Ismā'ilīs.³

Fossils in Fastnesses

So much for the evidence that the *êthos* and aptitudes which are characteristic of penalized religious denominations tend to disappear if, and when, and in proportion as the penalization is remitted.

¹ See I. C (i) (b), Annex I, vol. i, pp. 358-65, above.

² For Shāh Ismā'il's work, see I. C (i) (b), vol. i, pp. 69-70, with Annex I, above.

³ The Imāmī Shī'īs of 'Irāq are a special case; for 'Irāq is a former province of Shāh Ismā'il's empire which was eventually conquered from the Safawīs by the 'Osmanlis after having changed hands several times in a series of wars which lasted more than a century (A.D. 1534-1639). The Imāmī Shī'īs of 'Irāq are in the same situation as their co-religionists in Syria and in Hasā, inasmuch as they have been subject to the political ascendancy of a Sunnī majority. They are in a different situation, inasmuch as their subjection has not been unbroken. For a brief interval, the Imāmī Shī'īs of 'Irāq were masters in their own house, as their more fortunate co-religionists in Iran have continued to be ever since the day when Shāh Ismā'il released the Imāmīs from the house of bondage in Iran and 'Irāq alike. In consonance with this peculiar history, the *êthos* of the Shī'īs in 'Irāq has become something intermediate between their *êthos* in Persia and their *êthos* in those places where they have always been under Sunnī domination. In our Western political terminology, 'Irāq is a Persian *terra irredenta* and the 'Irāqī Shī'īs, though mostly Arabs by language, may be regarded almost as a Persian minority under alien rule.

This evidence seems to indicate that the characteristics in question are not innate and ineradicable qualities, but rather symptoms of a particular response to a particular challenge—symptoms which have no greater permanence than the challenge and the response out of which they arise. We shall find this indication confirmed if we now compare the *ethos* of penalized denominations with that of co-religionists to whom the stimulus of penalization has never been administered. We shall observe that those who have never undergone tribulation resemble those who have come out of tribulation in being free from the distinctive and unmistakable characteristics which those who are actually suffering tribulation almost invariably display.

The 'Osmanlis draw a sharp distinction between the 'fresh-water' French, English, and so on, and their 'salt-water' namesakes. The 'fresh-water' Franks are those who have been born and bred in Turkey in the Levantine atmosphere and have duly responded by developing the Levantine character. The 'salt-water' Franks are those who have been born and bred at home in Frankland and have come out to Turkey as adults at an age when their character has already been formed. The Turks have been intrigued to find that the great psychological gulf which divides them from the 'fresh-water' Franks does not intervene when they have to deal with the Franks from beyond the sea. The Franks who are geographically their compatriots are psychologically aliens; the Franks who come from a far country turn out to be men of like passions with the Turks themselves. This apparent paradox has a simple explanation. The Turk and the 'salt-water' Frank are able to understand one another because there is a broad similarity between their respective social backgrounds. They have each grown up in a social environment in which they have been masters in their own house. On the other hand, they both find difficulty in placing themselves *en rapport* with the 'fresh-water' Frank because the 'fresh-water' Frank has a social background which is equally foreign to both of them. The 'fresh-water' Frank—the Frank brought up in Turkey—is not a son of the house but a child of the ghetto; and this peculiar social environment has induced in him an *ethos* from which the Frank brought up in Frankland and the Turk brought up in Turkey have both remained free.

This Turkish dichotomy between the 'fresh-water' and the 'salt-water' Frank, within the body social of a civilization which is still 'a going concern', has an analogue in the sociology of those remnants of extinct civilizations which survive in the form of 'fossils'; for the 'fossils' of which we have knowledge are preserved in one or other of two alternative situations which are entirely dissimilar. In the present chapter up to this point, we have confined our attention to

'fossils' which have been preserved in the shape of penalized religious denominations 'dispersed abroad among the Gentiles'; and we have seen that 'fossils' in this situation, if they survive at all, succeed in holding their own by learning to excel in the narrow field of social activity to which their Gentile neighbours and masters are apt to confine them. There is, however, another situation in which 'fossils' can and do maintain themselves in existence on easier terms. Instead of working their way through the fabric of some Gentile body social until they find a precarious lodgement in its crevices, like flints in chalk, they may segregate themselves into some fastness where they can be sure of being left in peace by the Gentiles round about; and most of the 'fossils' of which we have hitherto taken account have in fact been preserved partly in such fastnesses and not solely in dispersion. We can substantiate this by a cursory survey.

For example, the Jewish 'Diasporà'¹—in the variant forms of Ashkenazim and Sephardim and Dönme and crypto-Jews—is not the only shape in which the Jewish 'fossil' of the extinct Syriac Civilization survives to-day. Side by side with the conspicuous majority of Jewry which has held its own by learning to endure the life of the ghetto, there are other Jews—less numerous and less notorious but not less interesting to the student of history—who have held their own by withdrawing into mountains and deserts where they have converted the primitive inhabitants to Judaism and have themselves reverted more or less to the primitive way of life. Such are the Jewish peasantry and artisans in the highlands of the Yaman, in the south-western corner of Arabia; the Jewish highlanders called the Falasha in Abyssinia; the Jewish highlanders in the Caucasus; and the Krimchaks of the Crimea—a Turkish-speaking Jewish community that is believed to be descended from the Khazar Nomads who were converted to Judaism in the eighth century of the Christian Era at a time when they were ranging over the Don-and-Volga section of the Eurasian Steppe.²

Similarly, the Nestorian 'fossil' of the Syriac Civilization is not represented solely by craftsmen in the cities of 'Irāq, or by 'Saint Thomas's Christians' in Travancore, who are the Nestorian 'Diasporà'. There is also a Nestorian peasantry in the secluded uplands along the western shore of Lake Urmia, in North-West Persia; and there are (or were till yesterday) Nestorian 'wild highlanders' in the

¹ *Διασπορά* is an ancient Greek word meaning 'dispersion' which was adopted by the Jews as a name for that section of Jewry which came to be dispersed abroad among the Gentiles of the Hellenic World after the intrusion of Hellenism upon the Syriac World through the destruction of the Achaemenian Empire by the action of Alexander the Great.

² For further information about these Jews in fastnesses, see the Annex to the present chapter on pp. 402-12, below.

Hakkari highlands of Kurdistan. It is the same among the Monophysites. The Armenian 'Diasporà' has its foil in the Armenian peasantry which used to cultivate the uplands round the shores of Lake Van and the Armenian 'wild highlanders' who used to live their own life in the fastness of Sasūn, on the watershed between the headwaters of Tigris and Euphrates, and in the fastnesses of Hajjīn and Zeytūn in the Cilician Taurus. The Coptic 'Diasporà' of Cairo and the Delta has its foil in the Coptic peasantry of the Sa'id, and also in the Christian 'wild highlanders' of Abyssinia, who are adherents of the Coptic Monophysite Church and whose local prelate ('Abunā') is an appointee of the Coptic Patriarch of Alexandria. The Jacobite 'Diasporà' in Syria has its foil in the Jacobite highlanders of the Tūr 'Abdīn: a fastness on the watershed between Tigris and Khabur near the meeting-point of the post-war frontiers between Syria, 'Irāq, and Turkey. Among the Monothelite Lebanese emigrant who sets up shop in Egypt or West Africa or America and his brother who stays at home to cultivate the terraced flanks of 'the Mountain'.

In the Shī'ah, we find that the Ismā'īlī 'Diasporà' in India and East Africa likewise has its foil in the Ismā'īlī highlanders of the Jabal Ansariyah in Northern Syria: an untamed Ismā'īlī community which is descended from a garrison once established in this Syrian fastness by 'the Old Man of the Mountain' in the militant phase of the sect, in the age of the Crusades. The Shī'ah has also thrown off the religious community of the Druses: a 'fossil' which now survives in fastnesses only and is no longer to be found in dispersion at all.¹

¹ 'The Druses were the adherents of an esoteric non-proselytizing religion founded in the eleventh century after Christ by the Fatimid Caliph Al-Hākim bi'amrillāh, and they took their name from Al-Hākim's apostle Ad-Darazī. In matters of religion the Druse community was divided into a hierarchy of initiation-classes. There was the "spiritual section" (qism-ar-Rūhānī), subdivided into the chiefs (ar-Ru'asā), the intelligent (al-'uqalā), and the excellent (al-ajāwid); and the "corporeal section", subdivided into the lords (al-umārā) and the ignorant (al-juhāl). Initiation was open to women as well as men. Like many other small and peculiar sects which have managed to survive, the Druses tended to withdraw into mountain fastnesses. At the date when the French and British mandates were introduced there were four main Druse strongholds—one in the Lebanon east of Bayrūt, the second in the extreme south-west of the Lebanon, the third on the western slopes of Mount Hermon, and the fourth in the Jabal-ad-Durūz—an isolated mass of rugged and ill-watered mountains which rose abruptly between the fertile corn-lands of the Hawrān to the west and the Hamād steppe to the east. The central shrine of the Druse religion, Khalwat-al-Biyād, lay in the Mount Hermon district, while the chief political focus of the Druse community had formerly lain in the Lebanon; but during the past two centuries—and especially after the migration which followed the French military intervention in 1860 and the organization of the autonomous sanjāq of the Lebanon in 1861-4—the political centre of gravity had shifted to the most remote and militarily strongest of the Druse fastnesses: the Jabal-ad-Durūz (as it came to be called *par excellence*). During the period under review the mandatory authorities estimated that there were 48,000 Druses in the Jabal (out of a total population of about 60,000), 40,000 in the Lebanon east of Bayrūt, 2,000 in the south-west, 7,000 in the Mount Hermon district, and 7,028 in the British mandated territory.' (Toynbee, A. J.: *Survey of International Affairs*, 1925, vol. i (London 1927, Milford), pp. 406-8.) See, in general, Hitti, P. K.: *The Origins of the Druze People and Religion* (New York 1928, Columbia University Press).

On the other hand, the antithesis between 'fastness' and 'dispersion' presents itself, once again, among the Greek Orthodox Christian ra'iyeh of the old Ottoman Empire, in the striking contrast between the two sections which took up arms simultaneously in A.D. 1821, at opposite extremities of the Ottoman dominions, with incompatible aspirations and diverse fortunes: the merchants and administrators of the Phanar and the 'wild highlanders' of the Mani.¹

This brief survey of the dichotomy between 'fossils in dispersion' and 'fossils in fastnesses' yields a uniform result. The 'fossils' preserved in fastnesses, where they have never been subject to penalization, display no symptoms of the *ethos* which is characteristic of the same 'fossils' where they are found in dispersion in the shape of penalized and specialized minorities. The Jewish peasant in the Yaman has much more in common with his Muslim fellow-worker on the land than with his Jewish co-religionist in the ghetto; the Jewish tribesman in Abyssinia or the Caucasus has much more in common with the Christian or Muslim tribesmen round about who lead the same turbulent and predatory life in the same highlands.

VII. THE GOLDEN MEAN

The Law of Compensations

We have now reached a point at which we can bring our present argument to a head. We have ascertained that civilizations come to birth in environments that are unusually difficult and not unusually easy; and this has led us on to inquire whether or not this is an instance of some social law which may be expressed in the formula: 'the greater the challenge, the greater the stimulus.' We have pursued this inquiry by our customary empirical method. We have made a survey of the responses which are evoked by five types of challenge—the challenges of hard countries, new ground, blows, pressures, and penalization—and in all five fields the upshot of our survey appears to attest the validity of the law which we have formulated above. We have still, however, to determine whether its validity is absolute or limited. If we increase the severity of the challenge *ad infinitum*, do we thereby ensure an infinite intensification of the stimulus and, by the same token, an infinite increase of energy

¹ See the present chapter, pp. 226-7, above, and II. D (vii), p. 262, below. It is one of the curiosities of History that the Mani, which became a fastness of Orthodox Christianity under the Ottoman régime, had previously served as the last fastness of Hellenism. The fact is recorded by the learned East Roman Emperor Constantine Porphyrogenitus (*imperabat* A.D. 912-59):

'The inhabitants of the fastness of Mani are not of the same stock as the [Moreot] Slavs but are descended from the ancient Romans; and down to this day they are locally called Hellenes because once upon a time, long ago, they were idolators who bowed down to idols like the ancient Hellenes. These people were baptized in the reign of Basil of glorious memory (*imperabat* A.D. 866-86), and they have been Christians ever since.' (Constantine Porphyrogenitus: *De Imperio Administrando*, ch. 50.)

in the response which the stimulus evokes when the challenge is responded to successfully? Or do we reach a point beyond which an increase in severity brings in diminishing returns? And if we go beyond this point, do we reach a further point at which the challenge becomes so severe that the possibility of responding to it successfully is eliminated altogether? If the former of these two alternatives proves to be the truth, then we shall be able to lay down the law of 'the greater the challenge the greater the stimulus' without qualification. In the other event, we shall have to enter the *caveat* that some challenges may be excessive, and we shall then have to qualify the law of 'the greater the challenge the greater the stimulus' by formulating an overriding law to the effect that 'the most stimulating challenge is to be found in a mean between a deficiency of severity and an excess of it'.

Where does the ultimate truth lie? At first thoughts, we may incline to the view that 'the greater the challenge the greater the stimulus' is a law which knows no limits to its validity. We have not stumbled upon any palpable limits at any point in our empirical survey so far; and there are several celebrated extreme cases of the operation of the law which we have hitherto held in reserve.

We have not yet cited the example of Venice—a city built on piles driven into the barren mud-banks of a salt lagoon which has surpassed in wealth and power and glory all the cities built on terra firma in the fertile plains of the Po and the Adige. Nor have we cited the example of Holland—a country which has actually been salvaged from the sea and which has to be protected in perpetuity by dykes against submergence under the encircling waters that stand high above the level of the land. Yet Holland has distinguished herself in history far above any parcel of ground of equal area in all the rest of the great North European plain which stretches away—safe above sea-level—from the eastern margin of the Polders to the western foot-hills of the Urals.

Holland is assuredly the original, 'in real life', of that imaginary land which Goethe's Faust redeems from the waters of the Baltic when he is working out the redemption of his own soul from the toils of Mephistopheles. In this land, as Faust describes his work,

Eröffn' ich Räume vielen Millionen,
Nicht sicher zwar, doch tätig-frei zu wohnen;
Grün das Gefilde, fruchtbar; Mensch und Herde
Sogleich behaglich auf der neusten Erde,
Gleich angesiedelt an des Hügels Kraft,
Den aufgewälzt kühn-emsige Völkerschaft;
Im inneren hier ein paradiesisch Land—
Da rase draussen Flut bis auf zum Rand,

Und wie sie nascht, gewaltsam einzuschiessen,
 Gemeindrang eilt, die Lücke zu verschliessen.
 Ja! diesem Sinne bin ich ganz ergeben,
 Das ist der Weisheit letzter Schluss:
 Nur der verdient sich Freiheit wie das Leben,
 Der täglich sie erobern muss.¹

What challenge could be more extreme than the challenge presented by the sea to Holland and to Venice? What more extreme, again, than the challenge presented by the Alps to Switzerland? And what responses could be more magnificent than those which Holland, Venice, and Switzerland have made? The three hardest pieces of country in Western Europe have stimulated their inhabitants to attain the highest levels of social achievement that have yet been attained by any of the peoples of Western Christendom.

A less well-known but not less impressive example of a heroic response to an extreme challenge from Physical Nature is offered by a survey of the places which were the historical nuclei of Modern Greece. One political nucleus was the Phanar: a remote corner of Stamboul which the Ottoman Pādishāh had assigned to the Greeks as a kind of Christian ghetto. The Phanariots responded by becoming adepts in the Western art of diplomacy.² One cultural and economic nucleus was Ayvalyq: a rocky peninsula on the Anatolian coast which seemed so barren that the Ottoman Pādishāh was content to grant his Greek subjects an exclusive right of occupancy. The Greek settlers made the barren rock bear olives and imported Western culture into their commonwealth as the return-cargo for their exports of olive-oil.³ Another economic nucleus was Ambelakia: a village perched high on the flank of Mount Ossa, overlooking the defile of Tempe, which made a livelihood by spinning and dyeing cotton for the Western market.⁴ Another was the Macedonian village of Shátishta which stands marooned among the stony hills that flank the upper valley of the Haliacmon over against Pindus. In the eighteenth century, after the Danubian Hapsburg Monarchy, in its counter-offensive against the Ottoman Power, had pushed its south-eastern outposts deep into the Balkan Peninsula, the Greeks of Shátishta made a livelihood by organizing an overland caravan-traffic for exchanging the dyed cotton goods of Ambelakia and other products of the Ottoman Empire for the products of the

¹ Goethe: *Faust*, II. 11563-76. The last two lines here quoted have been quoted already in vol. i, p. 277 and in the present volume, p. 17, above.

² See II. D (vi), pp. 222-5, above.

³ See II. D (ii), footnote on p. 40, above.

⁴ See the interesting account of Ambelakia which is given by Clarke, E. D.: *Travels*, Part II, section iii, ch. 9, pp. 285 sqq. (London 1816, Cadell and Davies.) Dr. Clarke visited Ambelakia on the 23rd-24th December, 1801. The red dye used by the Ambelakiots was a local product obtained from the Valona oak.

West. The commercial houses of this out-of-the-way Macedonian village had their branches in Budapest and Vienna and Leipzig and Dresden.¹ As for the maritime nuclei, Hydhra and Petses and Psarà and Kasos are uncultivable limestone islands; Trikeri is a rocky peninsula; Galaxidhi is a tiny harbour on the least inviting stretch of the coastline of the Gulf of Itéa. Yet these six maritime communities, between them, built up a thriving Greek merchant marine; and when their seamen diverted their energies from trading to fighting at the outbreak of the Greek War of Independence, their light craft swept the Ottoman Navy off the seas as effectively as the light craft of Elizabethan England dealt with the Spanish Armada. As for the places which distinguished themselves during the War of Independence in the fighting on land, the Mani, whose warriors struck the first blow,² is a peninsula which is almost entirely occupied by a lofty mountain-range and is almost entirely destitute of both soil and water. The soil is so meagre that it will grow neither cereals nor vines nor even olives, but only prickly pears. The water is so scarce that there are only three springs in the whole country, which has to depend for the rest of its supply upon rain-water collected in cisterns.³ Similarly Suli, which played its part in a preliminary duel with 'Alì of Yánnina, is ensconced in the wildest and barrenest highlands of Epirus, while Mesolonghi, which is celebrated for the siege in which Byron died, is a fishing-village on a mud-bank in a lagoon: an embryonic Greek counterpart of Venice.

Venice and Holland and Switzerland, Mesolonghi and Mani and Hydhra: do they not all testify with one accord that our law of 'the greater the challenge the greater the response' holds good absolutely, without limitation? At first thoughts, the answer to this question appears to be plainly in the affirmative; yet certain cautionary second thoughts are suggested by a closer comparative study of these particularly telling illustrations which we have just assembled.

It is quite true that in all these places the challenges to which the inhabitants have responded so magnificently have been severe to an extreme degree; but it is also a fact that these superlative challenges have one feature in common which mitigates their severity considerably. Extreme though they are in degree, they are limited in range to one only out of the two realms which together constitute the total environment of any human society. These challenges are,

¹ When the writer of this Study visited Shátishta in the summer of 1921, he was shown portraits of ancestors—all dressed up in wigs and powder and patches and crinolines—which had been painted during their residence in the commercial centres of the West and had been brought home to Shátishta to be preserved as memorials.

² See II. D (vi), pp. 226-7 and 259, above.

³ The writer tested the rigours of the Mani for himself in the spring of 1912, when he walked down to the tip of the peninsula on his own feet and returned, *hors de combat*, on mule-back.

all alike, challenges in the realm of the physical environment, and in that realm only. Before, therefore, we can properly assess the severity of the total challenge with which the inhabitants of these places have been presented by their environment as a whole, we have to examine the human environment as well, and to ascertain what challenge, if any, has been presented here. As soon, however, as we follow this line of inquiry up, we observe that in all these places the exceptional severity of the challenge from the local physical environment has carried with it an exceptional immunity from certain specific, and possibly not less formidable, challenges from the human environment which have actually been presented to the inhabitants of the regions round about. The very barrenness or inaccessibility, in which the exceptional severity of the physical challenge has consisted, has served as a shield and buckler against those human challenges inasmuch as these physical drawbacks have deterred or frustrated certain potential human aggressors.

This secondary and compensatory effect of the physical challenge is no mere matter of speculation. It is manifest in the histories of all three places in Western Europe and thirteen places in Greece.

For example, the superlative physical challenges from the sea which have been presented to Venice and Holland have not only administered to them a physical stimulus which their neighbours have lacked, but have incidentally served to shield them from a human ordeal to which their neighbours have been exposed. Venice on her mud-banks, insulated from the continent by her lagoons, was exempt from foreign military occupation for little short of a thousand years: from the day when the Franks evacuated her in A.D. 810 to the day when the French took possession of her in A.D. 1797. Holland, likewise, within her girdle of canals, was saved from foreign military occupation for the best part of two centuries—from her armistice with Spain in A.D. 1609 until she was overrun by the French revolutionary armies in 1794-5.¹ As a Dutch statesman once remarked in a famous conversation with a king of Prussia, these Dutch canals were comfortably deeper than the height of a Pomeranian grenadier; and they could be made to flood the country far and wide at a few hours' notice.² What a contrast to the histories of Lombardy and Flanders—the respective neighbours of Venice and Holland on terra firma—which notoriously have been the two habitual battle-fields of Europe. It will be seen that, in Dutch and Venetian history, the sea has played a dual role—the sheltering role

¹ The stimulus derived by the Dutch from their responses to human challenges represented by interludes of Spanish, French, and German domination is, of course, a factor in Dutch history which has to be kept distinct from the divers effects of the physical environment with which we are concerned here.

² When the French invaded Holland in 1794-5, 'General Winter', who was to defeat them in Russia eighteen years later, was fighting on their side. Holland's girdle of protecting waters was frozen hard, and the Dutch fleet itself, fast bound in the ice, was captured by the French cavalry—an incident that is perhaps unique in naval and military history.

of a guardian angel as well as the stimulating role of a Satan or a Mephistopheles—and so it has been in Swiss history with the Alps. The mountains have not only stimulated the Swiss to earn by dairy-farming and watch-making and other ingenuities the livelihood which Alpine agriculture could not afford them. The Alps have also served the Swiss in a simpler and more direct way by helping to drive out and keep out the Hapsburgs and the Burgundians and a whole series of human aggressors.

The thirteen nuclei of Modern Greece which we have passed in review reveal the same phenomenon of compensation in the sphere of the human environment for a challenge in the sphere of Physical Nature. In all these cases, the physical challenges of remoteness and stoniness and waterlessness and mountainousness were unquestionably stimulating in themselves, but they also had a protective value in the human sphere which was of first-rate historical importance.

It is a well-known social law that when and where the Government is incompetent or corrupt or high-handed or malevolent, or is vicious in all these ways, or in several of them, at once, the subject's chance of prosperity depends on his escaping the Government's notice or failing to excite the Government's cupidity. In these adverse social circumstances, the normal values of the physical environment are inverted. When the Government is immoderately rapacious in 'taking up that' which it 'laid not down and reaping that' which it 'did not sow',¹ the fertile field actually yields less sustenance to the cultivator than some patch of stony ground which is beneath the notice of the tax-farmer; and a situation on the brink of a fine harbour or on the route of the king's highway is actually less remunerative to the merchant and the craftsman than a fastness in the hills where he is out of sight and reach of the king's armies and officials and couriers, who make their way by commandeering food and lodging and ships and carts and horses and coolies from the local inhabitants of the harbourside and the roadside. Such circumstances came to prevail in the Ottoman Empire during the two centuries and a half that elapsed between the death of Sultan Süleymān the Magnificent in A.D. 1565 and the outbreak of the Greek War of Independence in A.D. 1821; and the sites of the places which have been the historical nuclei of Modern Greece are all in conformity with the social law which we have just formulated.

Why did the Pādīshāh leave the Phanar to the Greek Orthodox Christian inhabitants of Constantinople when he expelled them from all the rest of Stamboul? Why did he grant the Albanian Orthodox Christian colonists of Hydhra the privileges of complete

¹ Luke xix. 22.

local self-government and almost complete immunity from Imperial taxation? Why did he confer on the Greek colonists of Ayvalyq, in addition to the privilege of local self-government, the even more remarkable and precious concession that no Muslim should retain the right of residence within their parochial boundaries? Simply because he regarded the Phanar as an uninhabitable hole in a corner, and Hydhra and Ayvalyq as uncultivable wastes. He was not taking the children's bread and casting it to dogs. He was merely allowing the Christian dogs to eat of the crumbs which had fallen from their Muslim masters' table.¹ Why, again, were the Ambelakiots allowed to spin and dye and make money unmolested? Because Ambelakia was perched on the flank of Ossa at a safe altitude, or, in other words, at such a height that when the village caught the Ottoman extortioner's eye as he rode, far below, through the vale of Tempe, his laziness got the better of his greed, with the consequence that he rode on sullenly to plunder some poorer village within easier reach.² And why were the Christian Greeks of Shâtishta allowed to make fortunes out of their caravan-traffic? Because their Muslim Greek neighbours had done them a double service when they drove them out of the fertile valley-bottom into the barren uplands. They had not only compelled them—at a profitable moment—to turn their attention to commerce instead of agriculture, but they had also jostled them into a cranny in the hills where they could accumulate wealth unnoticed. Why, lastly, did the Maniots and the Suliots retain their autonomy and their arms and their warlike spirit? Because it had not been worth the Pâdishâh's while to follow them up into their barren highland fastnesses, as it was eminently worth his while to take and hold the orange-groves of Sparta and the currant-plantations of Elis and the mastic-villages of Chios and the harbours of Patras and Nauplia and the dome of Aya Sofia and the gardens of the Seraglio. It is evident that the sites of our thirteen nuclei of Modern Greece cannot be

¹ Matthew xv. 26-7.

² 'This Empire, as vast and large as it is, is yet dispeopled, the villages abandoned, and whole provinces as pleasant and fruitfull as Tempe or Thessaly uncultivate and turned into a desert or wilderness—all which desolation and ruine proceeds from the tyranny and rapine of the *Beglerbegs* and *Pashaws*; who either in their journeys to the possession of their Government, or return from thence, expose the poor inhabitants to violence and injury of their attendants, as if they had entred the confines of an enemy or the dominions of a conquered people. In like manner, the insolence of the horse and foot is unsupportable; for, in their marches from one countrey to another, parties of 20 or 30 are permitted to make excursions into divers parts of their own dominions, where they not only live upon free quarter but extort money and cloaths from the poor vassals, taking their children to sell for slaves, . . . so that, rather than be exposed to such misery, and licence of the soldiery, the poor people choose to abandon their dwellings and wander into other cities, or seek for refuge in the mountains or woods of the countrey.' (Rycaut, *Sir Paul: The Present State of the Ottoman Empire* (London 1668, Starkey and Brome), p. 170.)

For the break-down of the Ottoman system, to which these evils were due, see Part III. A, vol. iii, pp. 44-50, below.

accounted for completely until the exceptional local mildness of the human environment as well as the exceptional local rigour of the physical environment is taken into the reckoning.

We have evidently to reckon with the same combination of factors in interpreting the contrast, which we have noticed in a previous passage,¹ between the respective achievements of two modern communities in Syria—the Lebanese and the Nusayrīs—who have been fellow-sufferers with the modern Greeks from the misgovernment of the Ottoman Empire in its period of decline. In seeking to account for the prowess of the Lebanese, we must take into account the political seclusion as well as the physical rigour of their forbidding mountain fastness. And conversely, in seeking to account for the stagnation of their neighbours the Nusayrīs, we must bear in mind the political disadvantages which the relative openness and agreeableness of the Jabal Ansariyah has entailed.

‘Leurs montagnes sont communément moins escarpées que celles du Liban; elles sont en conséquence plus propres à la culture; mais aussi elles sont plus ouvertes aux Turcs; et c’est par cette raison, sans doute, qu’avec une plus grande fécondité en grain, en tabac à fumer, en vignes et en olives, elles sont cependant moins peuplées que celles de leurs voisins les Maronites et les Druzes.’²

Having caught this glimpse of ‘compensations’ in the human environment in the course of surveying certain superlative challenges from the physical environment which we had not examined before, let us now glance once again at some of those other illustrations of Challenge-and-Response which we have passed in review in earlier chapters of the present Part. When we thus extend our horizon, we shall find evidence of a ‘compensatory’ interaction between the physical and the human environments which is operative in both directions. There are not only challenges from the physical environment but also challenges from the human environment which have demonstrably tempered their own severity by producing an incidental compensatory effect in the complementary field. Let us first complete our survey of compensations accruing in the human sphere from challenges encountered in the physical, and then go on to consider the instances in which the compensation is physical and the challenge human.

The severity of a challenge in the physical sphere may be compensated in the human sphere in several alternative ways, as is already apparent from the illustrations which we have just been examining. A site which presents unusual physical difficulties to

¹ In II. D (ii), on pp. 55–7, above.

² Volney, C. F.: *Voyage en Syrie et en Égypte pendant les Années 1783, 1784 et 1785*, 2nd ed. (Paris 1787, Desenne et Volland, 2 vols.), vol. ii, pp. 7–8.

its occupants may secure them at the same time an unusual freedom from human molestation because the site is either unattractive or inaccessible to outsiders or because it is forbidding in both senses at once.

We have seen that, in Orthodox Christendom in the latter days of the Ottoman Empire, the Greek 'squatters' in the Phanar and in Ayvalıq were compensated for an 'ineligible location' and for a stony soil by the very fact that these physical blemishes made both sites unattractive to the 'Osmanlis. Similarly, in Ancient Greece, at the dawn of Hellenic history, the stoniness of Attica not only stimulated the Athenians by its challenge¹ but also brought them compensation by proving unattractive to the immigrant 'Dorians'. In Ancient Syria, likewise, at the dawn of Syriac history, the Israelite 'squatters' were compensated as well as stimulated by the stoniness of the Hill Country of Ephraim—a physical blemish thanks to which these highlands overlooking the highway between Egypt and Shinar had been preserved as an untenanted no-man's-land from time immemorial until the Israelitish infiltration.² Thus, too, in the Hindu World, when it was being visited by the calamity of Muslim invasion, the deserts and forests of Rājputāna not only stimulated those Hindus who responded to their physical challenge, but also brought them compensation by offering little or no attraction to the Muslim invaders. The Muslims, descending upon India from the Iranian Plateau, did not rest till they had conquered the whole of the Indus Valley down to the coast of the Indian Ocean and the whole of the Ganges Valley down to the coast of the Bay of Bengal; but they were content to leave the Rājputs their independence in the 'bad lands' that occupied the angle between the two river-systems, notwithstanding the fact that Rājputāna skirts the banks of the Sutlej and the Jumna as closely as the Hill Country of Ephraim overhangs the lowlands of Philistia and the Vale of Esdrael. If we extend our survey to the Andean World, we may also conjecture that the builders of Tiahuanaco were compensated for the bleakness of the upland basin of Lake Titicaca³ by immunity from molestation on the part of their powerful neighbours in the maritime plain.

In a later age, after the Titicaca Basin had been broken in by the efforts of the ancient pioneers, its latter-day inhabitants, the Collas, were compensated for the lesser effort of keeping the bleak uplands under cultivation by being shielded against molestation from another quarter. The domineering snow-peaks, which sent down chilly winds and raging blizzards to blight their crops, also served the

¹ See II. D (ii), pp. 37-42, above.

² See II. D (ii), pp. 52-5, above.

³ See II. C (ii) (b) 2, vol. I, p. 322, and II. D (v), in the present volume, p. 208, above.

Collas as a rampart against the warlike savages of the tropical Amazonian forest, who were effectively kept at a distance by their inability to cross the snow-line.¹ These Amazonian savages would have found the Collao attractive enough if the mountains had not rendered it inaccessible to them; and thus, from the Collas' standpoint, the mountains had a twofold aspect. Though physically oppressive they were humanly protective. In fact, the Andean snows have played here the same dual role as the high altitudes of Shátishta and Ambelakia or the depression of Hölland below the level of the sea. In each of these instances, a physical blemish has not only acted as a stimulus but has also brought its own compensation with it in the human sphere by conferring the boon of inaccessibility.

We may observe that a similar compensation is apt to be conferred by the physical ordeal of transmarine migration. The emigrants from the zone of post-glacial desiccation in North Africa who became the fathers of the Minoan Civilization in Crete by responding to the challenge of the sea² were compensated in the human sphere for the physical perils of navigation. We may read the same tale in the history of England. In the *Völkerwanderung* which accompanied the break-up of the Roman Empire, those continental North-European barbarians who took to the sea in order to invade the Roman island of Britain chose a harder path than their comrades who drifted into the Roman provinces on the mainland. On the other hand, throughout the whole course of Western history, from the first emergence of our Western Civilization until the recent inventions of the submarine and the aeroplane, the descendants of the seafaring Jutes and Angles have been enjoying the compensation that has accrued from their forefathers' ordeal. They have been reaping the profits of an insularity which has been the perpetual envy of their continental neighbours—the descendants of the land-loping Saxons and Franks and Sueves and Lombards.

In the modern age of Western history, the same ordeal of migration across the sea has brought a similar compensation to all those victims of religious persecution in Europe who have found freedom of worship in the New World.

Where the remote Bermudas ride
In the ocean's bosom unespied,
From a small boat that row'd along,
The listening winds received this song:
 'What should we do but sing His praise
That led us through the watery maze
Unto an isle so long unknown
And yet far kinder than our own?

¹ See II. D (v), p. 208, above.

² See II. C (ii) (b) 2, vol. i, pp. 323-30, above.

Where He the huge sea-monsters wracks,
That lift the deep upon their backs,
He lands us on a grassy stage,
Safe from the storm's and prelate's rage;

And in these rocks for us did frame
A temple where to sound His name.
Oh! Let our voice His praise exalt
Till it arrive at Heaven's vault,
Which thence (perhaps) rebounding may
Echo beyond the Mexique bay!

Thus sung they in the English boat
A holy and a cheerful note;
And all the way, to guide their chime,
With falling oars they kept the time.

The English seafarers in whose mouth this song of thanksgiving has been placed by a seventeenth-century poet were Presbyterian emigrants who had been rewarded for braving the perils of the Atlantic by being led to an earthly paradise in the Antilles. Their compensation was, indeed, in both kinds; and the physical delights of a tropical island—which are depicted by Andrew Marvell in the loveliest lines of his poem¹—had the same enervating effect upon these English navigators that we have seen them have upon Polynesian navigators on the other side of the planet.² To-day the song sounds only faintly off the coast of the Bermudas; yet the singers' pious hope has been fulfilled; for their voice has indeed rebounded from 'Heaven's vault' till it echoes now 'beyond the Mexique bay' in stentorian reverberations. The song of these English Presbyterian seafarers who found freedom of worship in an earthly paradise in the Bermudas has become the song of their kinsmen and co-religionists who have likewise crossed the Atlantic to find the same religious freedom in a prosaic eldorado on the North American Continent. And voices from every quarter of the overseas world are singing in chorus: the voice of French Huguenots who have found freedom of worship in South Africa, and the voice of Irish Catholics who have found it in Australia and in Spanish America as well as in the United States.

We still have to glance at certain instances in which a site that presents unusual physical difficulties to its occupants is not only inaccessible to outsiders but is unattractive to them as well. Where the physical features of a site thus make it doubly forbidding, the compensation in the human sphere accrues in double measure.

This has been the good fortune of Venice and of Hydhra: a

¹ These lines have been omitted in the quotation above.

² See II. D (i), pp. 13-15, above.

mud-bank and a rock-reef which have both been protected from molestation by the twin safeguards of insularity and barrenness. The same double compensation has accrued to the inhabitants of other barren islands in the histories of other societies besides Western and Orthodox Christendom: to the Icelanders, for example, in Scandinavian history¹ and to the Tyrians and Aradians in Syriac history² and to the Aeginetans in Hellenic history³ and to the first human occupants of the Cyclades, who share with the Eteocretans the honour of being the fathers of the Minoan Civilization.⁴

The fathers of all the other 'unrelated' civilizations may likewise have enjoyed this double protection against their neighbours in compensation for the severity of the physical challenges to which they have courageously responded. At least, we may conjecture that when the fathers of the Egyptiac and Sumeric and Sinic civilizations had plunged into those jungle-swamps which they transformed in course of time into fields and cities, they did not find themselves compelled, like the Jews when they were rebuilding the walls of Jerusalem, to do their work with one hand while they held a weapon in the other.⁵ It seems more probable that these primeval Egyptiac and Sumeric and Sinic pioneers, unlike Nehemiah's Jewish contemporaries, were left in peace by their fellow men to wage and win their titanic war against Physical Nature. They may have had to suffer from human molestation at an earlier stage, when they were still living in the open. Some such human pressure—accentuated, in the Egyptiac and the Sumeric case, by the gradual desiccation of the Afrasian Steppe in the post-glacial age—may even have been the proximate cause of their taking their momentous plunge into a howling wilderness which no human being had ever attempted to penetrate before them. When once, however, they had descended into their terrestrial hell, we may suppose that their former neighbours were both unable and unwilling to follow in pursuit of them. The fathers of the Mayan Civilization may have secured a similar immunity from molestation by plunging into the tropical forest, and the fathers of the Andean Civilization by settling on the arid coastal plain and mounting on to the bleak plateau in its hinterland.

Again, those 'fossil' remnants of extinct civilizations that have survived in fastnesses⁶ all owe their preservation to the same double safeguard. A combination of unattractiveness with inaccessibility is the common characteristic of the Jewish fastnesses in the Caucasus and in the Yaman, the Jewish and Monophysite fastnesses in Abyssinia, the Nestorian fastness in Hakkari, and the Monothelete fastness in

¹ See II. D (iii), pp. 86-100, above.

² See II. D (ii), pp. 51-2, above.

³ See II. D (ii), pp. 48-9, above.

⁴ See II. C (ii) (b) 2, vol. 1, pp. 328-30, above.

⁵ See the Book of Nehemiah, ch. iv.

⁶ See II. D (vi), pp. 256-9, above, with the Annex.

the Lebanon. We have already taken note of two instances of this type in glancing at the Greek Orthodox fastnesses of the Mani and Suli in the old Ottoman Empire. It was a combination of unattractiveness with inaccessibility that saved both Suli and the Mani from ever feeling the full weight of the Ottoman oppression which crushed the life out of the Greek *ra'iyeh* in the neighbouring vales of Yánina and Sparta. Hence the Suliots and the Maniots—protected as well as stimulated by the physical hardness of their highland strongholds—were able to play active and decisive parts in the creation of Modern Greece. The same twofold compensation in the human sphere has accrued to the New Englanders from the physical hardness of Town Hill, Connecticut, and to the Mormons from the diverse but not less formidable physical hardness of Utah. It is not only because these new-found fastnesses in the North American wilderness have been stimulating to their occupants, but also because they have been at the same time unattractive and inaccessible to outsiders, that they have served their occupants so well and have assisted them to make the marks which they have succeeded in making on our Western history.

Let us now examine the inverse case in which the challenge is delivered in the human sphere while the compensation accrues in the physical.

The experience of the 'fossils in fastnesses', which we have been examining just above, is precisely inverted in the experience of the 'fossils in dispersion'. The Jews, for example, who survive in the fastnesses of the Caucasus and Abyssinia have responded successfully to a challenge from the physical environment and have been compensated by immunity from penalization at Gentile hands. These Jewish 'wild highlanders' are as free, and as upstanding, as their Monophysite and Muslim counterparts. Inversely, the Jews of the 'Diaspora' have successfully responded to the human challenge of religious penalization and have been compensated for their Babylonish captivity among the Gentiles by the presence of those flesh pots to which their ancestors used to look back with such regret after Moses had led them forth into the wilderness out of the fat land of Egypt.¹ The exercise of holding their own in a hostile human environment has not only stimulated the Jews of the Dispersion to activity. It has also enabled them, in diverse Gentile societies in successive ages, to keep their footing in the market-place and their seat in the counting-house and to take their tribute from the golden stream of commerce and finance, instead of having to put up with the poverty-stricken life of the wilderness that has been led by their Abyssinian and Caucasian co-religionists.

¹ See II. D (i), pp. 24-5, above.

There is a somewhat similar relation between the diverse experiences through which the fathers of the 'unrelated' and the 'related' civilizations have passed. The fathers of the 'unrelated' civilizations, like the 'fossils in fastnesses', have responded to a physical challenge and have been compensated by immunity from human molestation. Inversely, the fathers of the 'related' civilizations, like the 'fossils in dispersion', have been compensated in physical values for responding to a human challenge. The dynamic act by which a 'related' civilization is generated is the secession of a proletariat from a dominant minority; and this is a human, not a physical, ordeal. The insurgent proletariat which initiates a new civilization by passing through this ordeal successfully is compensated by inheriting a physical habitat, ready made, from its predecessors instead of finding itself compelled to create a new physical habitat for itself out of the virgin wilderness; and this compensation is not in human currency but in physical. It takes the form of a reprieve from physical hardship in place of that reprieve from human molestation which is granted to the pioneer who initiates a new civilization by wrestling with Physical Nature in the virgin wilderness.

This same phenomenon of physical compensation for successful response to a human challenge may be illustrated by other examples. We have just observed that the 'fossils in dispersion' are compensated for their endurance in holding their ground in a hostile religious environment by the golden opportunities for economic gain which this ground, so hardly held, affords them. There is an analogy to this in the experience of those emigrants from lean countries to fat countries who find their ordeal, not in holding their ground in spite of persecution, but in changing their ground under pressure of poverty.¹ The resulting situation is substantially the same. The Hadrami in Java, the Scotsman in England, and the French-Canadian in the United States are all responding, like the Jew in the Gentile World, to the challenge of an alien human environment; and, like the Jewish 'Diaspora' again, they are being compensated for their endurance of this human ordeal by 'reaping where' they have 'not sown', inasmuch as they are participating in the material prosperity which has been built up by the work of other men's hands in a country which is not the immigrants' home.

We can see our 'law of compensation' likewise at work in certain otherwise very diverse historical situations.

For example, the militant pioneers who extended the bounds of the Far Eastern Civilization in Japan by carrying on a frontier-warfare against the indigenous barbarian inhabitants of the Kwanto,²

¹ See II. D (vi), pp. 212-13, above.

² See II. D (v), pp. 158-9, above.

were compensated in the economic field for their military exertions. Their strenuous life in the marches not only gave them a stimulus which was conspicuously lacking in the interior at the court of 'the Cloistered Emperors' in Yamato; it also brought them a direct material reward; for the soil of the Kwanto, where they were carving out new fiefs for themselves at the barbarians' expense, was considerably more productive than the soil of Yamato: the region which was the original home of the Far Eastern Civilization in Japan and in which the Japanese Imperial patrimony was situate. In weighing the causes of the momentous revolution in which the preponderance passed from Yamato to the Kwanto in the course of the twelfth century of the Christian Era, we must give due weight to this economic factor. We must recognize that the wardens of the marches did not owe their triumph solely to the superiority in *moral* which their military training had given them over their unwarlike peers at the Court. They also owed it in part to the superiority in wealth which had accrued to them incidentally as their compensation in the economic field for their exertions in the military field.

The 'law of compensation' has also to be reckoned with in accounting for the rise of the cities of Paris and London in and after the ninth century of the Christian Era. In an earlier passage of this Part,¹ we have noticed the stimulus which was administered to these two cities of Western Christendom by pressure from Scandinavia. We have now to observe that the rivers which Paris and London respectively commanded had a twofold social function. They served as waterways not only for Viking raids but for international commerce; and the commanding situations of the two cities, athwart the courses of the Seine and the Thames, had more than one effect upon their civic fortunes. Standing where they stood, London and Paris were marked out, as we have already observed, to bear the brunt of the sea-raiders' attacks upon England and France; but, by the same token, they were also marked out to draw to themselves the lion's share of the two kingdoms' waterborne commerce. In other words, the ordeals of ninth-century London and Paris carried with them their own prospective compensation; and in this respect the history of the Londoners and the Parisians is not incomparable to the history of the Jews dispersed abroad among the Gentiles. In both cases, we have the spectacle of a community holding its ground tenaciously against intense hostile pressure; and in both cases, again, we find that it is rewarded doubly for its tenacity. It not only gains a moral stimulus from its act of resistance, but it also obtains a material compensation for its moral ordeal in virtue of the fact that the position from which it

¹ See II. D (v), pp. 198-9, above, and also the Annex to that chapter on pp. 400-1, below.

refuses to be driven out—by persecution or by force of arms, as the case may be—is a position of unique commercial profitability.

The existence of this 'law of compensation' and the wide range of its operation, of which we have now perhaps satisfied ourselves, may give us warning not to press to extremes our other law of 'the greater the challenge the greater the stimulus'. Before we allow ourselves to be convinced, on evidence, that this other law holds good without limitations, we must make sure that our evidence will stand the test of the supplementary 'law of compensation' which has now come to light. When we are confronted with a triumphant response to some challenge from the environment which is apparently superlative in its severity, we must not accept this evidence at its face value until we have made sure that the total environment has been taken into consideration. We must always bear in mind that the environment is twofold—a physical environment and a human—and that a challenge which is delivered in either one of these two realms and which appears superlatively severe at first sight, may prove on closer inspection to be tempered and attenuated by some compensation which it carries with it in the complementary realm, whichever of the two that may be. This is what we actually found when we examined the most extreme examples of Challenge-and-Response in the physical realm which we could call to mind: the examples of Venice and Holland and Switzerland and the thirteen historical nuclei of Modern Greece. Thereafter, when we extended our horizon, we again found our 'law of compensation' at work in the most extreme example of Challenge-and-Response in the human realm that can well be imagined: the example of the Jewish 'Diaspora'. We have not, however, come across any example of a triumphant response to a challenge which has presented itself with uniformly superlative severity in the physical and in the human realm simultaneously. This *argumentum ex silentio* does not, of course, go very far; but it goes far enough to suggest a doubt as to whether our law of 'the greater the challenge the greater the response' does retain its validity when the challenge is at once extreme in degree and relentless in presenting itself over the whole range of the total environment, instead of unobtrusively offering compensation in one of the two realms for the conspicuous severity of its incidence in the other.

How is a challenge proved excessive?

Are we, then, to conclude that the validity of this law is not absolute but limited? We can hardly draw that conclusion from the negative fact that no instance of a triumphant response to an unmitigatedly superlative challenge has actually come to our notice.

If we are to establish a convincing proof, it must be founded on positive evidence. We must be able to present unequivocal instances in which a challenge has proved to be excessive; and the excessiveness of a challenge will not be conclusively demonstrated by the mere fact that a particular party has failed to respond to the challenge in question on a particular occasion.

This will prove nothing in itself, because almost every challenge that has eventually evoked a victorious response turns out, on inquiry, to have baffled or broken one respondent after another before the moment when, at the hundredth or perhaps the thousandth summons, the victor has entered the lists at last. This is the notorious 'prodigality of Nature'; and, in the field of the histories of civilizations, a host of examples spring to mind.

For instance, the physical challenge of the North European forest effectually baffled Primitive Man. Unequipped, as he was, with implements for felling the forest trees, and ignorant of how to turn the rich underlying soil to account by cultivation, even if he had been capable of clearing it of its sylvan encumbrance, Primitive Man in Northern Europe simply avoided the forest and squatted on sand-dunes and chalk-downs which his successors afterwards scornfully rejected as 'bad lands' when the forest was falling at last under the blows of their axes. For Primitive Man, the challenge of the temperate forest was actually more formidable than the challenge of the frozen Tundras; and in North America his line of least resistance eventually led him Pole-ward beyond the forest's northern fringe to find his destiny in creating the Eskimo Civilization¹ in response to the challenge of the Arctic Circle. Yet Primitive Man's experience does not prove that the challenge of the North European forest was excessive in the sense of being altogether beyond human power of effective response; for where Primitive Man was baffled, the barbarians who followed at his heels were able to make some impression with the aid of tools and technique acquired from the rising civilizations with which they were in touch, until, in the fullness of time, the pioneers of two latter-day civilizations came and saw and conquered. Before the close of the fourteenth century of the Christian Era, the Northern forest had been effectively taken in hand and mastered—by Western Christian pioneers in Europe and by Orthodox Christian pioneers in Russia—all the way from the coast of the Atlantic to the foot-hills of the Urals.

Some fifteen centuries before that, in the second century B.C., the southern vanguard of the North European forest in the Basin of the Po had been subdued by the Roman pioneers of the Hellenic Civilization after having baffled the Romans' barbarous and primitive

¹ For the arrested civilization of the Esquimaux, see III. A, vol. iii, pp. 4-7, below.

predecessors from time immemorial. The Greek historian Polybius, who visited this country immediately after it had been opened up and been turned to account by Roman enterprise, has put on record his personal observations. He draws a striking contrast between the inefficient and poverty-stricken life of the Romans' Gallic predecessors, whose last survivors were still living this life in the backwoods at the foot of the Alps,¹ and the cheapness and plenty that prevailed in the adjoining districts which the Roman colonists had taken in hand.² It could never have occurred to Polybius, with this contrast before his eyes, to imagine that the Padane forest was invincible simply because the miserable remnant of the Gauls survived as a specimen of one community which had failed to respond to the forest's challenge. In Polybius's day, the testimony of the forest-bound Gallic kraals was given the lie by the opposing testimony of a thriving Roman country-side which now held the field, a stone's throw off, on ground which the forest had still been holding victoriously against Mankind a few years before. But suppose that an earlier Greek historian—let us say, a Herodotus—had been able to anticipate Polybius's visit to the Po Basin by some three centuries. He would have arrived on the scene at a moment when the Gallic avalanche had just descended from the Alps and was overwhelming the Etruscan prospectors who had ventured out north of the Apennines. After watching the discouraging spectacle of barbarism evicting the forerunners of civilization from a country which the barbarian was patently incapable of turning to account for himself, our Herodotus might well have returned to Hellas to report that the Padane forest was invincible and that the Etruscans, who had lightly taken up its challenge, had paid the inevitable penalty for their presumption by incurring the Envy of the Gods. The moral of this imaginary story may be expressed in the words of Solon's warning to Croesus: 'Respite finem.'³ The suggested inevitability of the Etruscans' failure was disproved within three centuries by the Romans' success. It is evident that a challenge is not proved unanswerable by the fact that some attempts to answer it have failed. It has first to be shown that the series of failures has been unbroken from beginning to end of the story.

Polybius's sketch of the Basin of the Po in the latter part of the second century B.C. bears a curious resemblance to the picture of the Basin of the Mississippi at the turn of the eighteenth and nineteenth centuries of the Christian Era which has been drawn for us in detail by a host of modern Western travellers. The contrast

¹ Polybius, Bk. II, ch. 17.

² Polybius, Bk. II, ch. 15.

³ The Greek original of the Latin proverb is placed in Solon's mouth by Herodotus (Bk. I, ch. 32).

between the last of the Gauls still starving within reach of plenty and the Roman pioneers who have compelled the primeval forest to yield up its hidden wealth at the summons of their axe and spade has been reproduced on another continent, at an interval of some two thousand years, in the modern contrast between the last of the Redskins and the American pioneers in the primeval forest of Kentucky or Ohio.

The Americans have responded victoriously to a sylvan challenge by which their Red Indian predecessors were baffled.¹ Indeed, they have increased the productivity of the soil and subsoil which they have conquered from the trees to such a degree that to-day, when the territory of the United States is occupied by 120 million people of European origin with a conspicuously higher standard of living than is enjoyed by their kinsmen and contemporaries who have not left their European homes, it is calculated that the present Red Indian population of the United States is not less numerous and possibly more numerous than the Red Indian population of the same territory some three centuries ago, before the first progenitor of the 120 million European intruders ever set foot on this American soil.² In other words, practically the whole of the present national income of the United States is derived from wealth that has been extracted direct from Physical Nature by the in-comers, and little or none of it is derived from wealth which has been robbed from the indigenous occupants (as the Inca's gold and silver was robbed from him by the Spanish conquistadores of Peru). On this showing, the present national wealth of the United States gives a fair economic measure of the difference between the ineffectual Red Indian response and the triumphant American response to the physical challenge of the North American forest. The monument

¹ By the seventeenth century of the Christian Era, when the English and French colonists of North America appeared on the scene, the Red Indian occupants of the vast area which is now covered by Canada and the United States had not begun to master the North American forest, though they did not lack an incentive for mastering it since they had already acquired the art of maize cultivation from the adjoining Mexic World. (See II. C (ii) (a) 2, vol. i, p. 265, above.) For the question whether an indigenous civilization, 'affiliated' to the Mexic, would or would not have emerged eventually in North America if the European Civilization of Western Christendom had not intervened, see the footnote on pp. 265-6 in II. C (ii) (a) 2, vol. i, above.

² If this calculation is correct, it bears eloquent testimony to the extent of the difference in degree between American and Red Indian economic efficiency, but it does not, of course, justify any retrospective condonation of the treatment which the Red Indians have received at American hands. (See II. C (ii) (a) 1, vol. i, pp. 211-14, above.) A statistical result, however interesting and remarkable, is impotent to undo crimes that have been committed and cruelties that have been suffered in real life. Though the present Red Indian population of the United States may be neither less numerous nor less well off than the Red Indian population of the same territory three centuries ago, the present representatives of the indigenous race are confined to an insignificant fraction of the area over which their predecessors once ranged, and they are descended from only a minority of the tribes which the European intruders found in existence on their arrival. The suffering and the wrong involved in the extermination of the majority of the Red Indian tribes and the alienation of the greater part of the territory over which they used to roam are hard facts which no figures can explain away.

of the American pioneer's victory over the forest is the present aspect of the United States; and, in face of the forest's ultimate defeat by Man, which this aspect now proclaims to the World, it is patent that the different aspect which the same territory wore three centuries ago, in an age when the North American forest was still dominant over the local representatives of the Human Race, afforded no valid evidence at all of the forest's invincibility. An Aztec explorer, visiting the Far North before A.D. 1600, would have been in grievous error if he had returned home to report that the Northern forest was invincible after observing the ineffectual efforts of the Algonquin and the Iroquois to plant their maize between the serried tree-stems. For, by A.D. 1600, the formidable conquerors of the North European forest were already girding up their loins to cross the North Atlantic and repeat their exploit in a New World.

The story of Man and the Forest is reproduced in the stories of Man and Mineral Oil and Man and the Air.

Like the forests of Europe and North America, the oil-fields of Azerbaijan have challenged one human society after another to master them for human ends before the challenge has eventually been answered. The Nomads, who are the earliest recorded tenants of the Azerbaijani Steppe, appear to have made no use whatever of the mineral wealth which was oozing out and welling up from below the surface of their cattle-pastures. The Syriac Society, which supplanted the Nomads in Azerbaijan in the early part of the sixth century B.C., when the Medes overcame the Scyths,¹ was not unaware of the peculiar natural phenomenon which was native to this remote border province on the outer edge of the Syriac World; yet, under the Syriac dispensation, the oil of Azerbaijan was harnessed solely for a religious purpose, without ever being turned to economic account. A few conspicuous natural gushers were imprisoned in towers in order that the rising jet might minister to the Zoroastrian cult of Fire by feeding a perpetual flame at the summit; and even this ritual use of the mineral only lasted as long as the local prevalence of the Zoroastrian religion. When Zoroastrianism gave way to Islam and the Syriac Civilization was superseded, in due course, by the 'affiliated' Iranic Civilization, these perpetual flames ceased to burn and the sole use which Man had so far made of Mineral Oil became obsolete. Yet the Azerbaijani oil-field was not destined to elude economic exploitation to the end of Time. The economic potentialities of this unexploited mineral resource did not escape the attention of Peter the Great when he passed that way in A.D. 1723 *en route* for the conquest of the Caspian provinces of Persia;²

¹ See II. D (v), pp. 136-8, above.

² See Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), pp. 480 and 518.

and although in this, as in other things, the intuitive genius of this Russian changeling anticipated the laborious discoveries of *Homo Economicus* in the West by the best part of two centuries, Peter's economic reconnaissance of the Azerbaijani oil-field was a true portent of things to come. At the beginning of the nineteenth century of the Christian Era, Baku was conquered again, and this time permanently, by a Russia which still retained the impetus towards economic Westernization that Peter had communicated to her; and, in the course of the same century, Baku Oil became one of the staple commodities of a Western economic system which had come to embrace the whole World and all Mankind. Indeed, at the present day, the mastery of Man over Oil has become so complete that it looks as though he might substitute oil for coal—as he has already once substituted coal for wood—to be his ordinary fuel and standard generator of light and heat and mechanical power. Thus the successive failures of the Nomadic and Syriac and Iranic civilizations to respond to the challenge of the Azerbaijani oil-field were not, after all, good evidence that this challenge was inherently insuperable.

As for the challenge of the Air, the myths of human Icarus and human Phaethon, who fell to destruction when they presumed to imitate the flights of their superhuman sires, convey a profound conviction that the Air—unlike the Forest or the Jungle-Swamp or the Desert or the Sea—is for ever destined to defeat the utmost efforts of human daring and ingenuity. Nor has this conviction of the Air's invincibility been limited to those Hellenic minds which have given it its classic expression in Mythology. It has been taken for granted by all men in all ages; and even in our own Western Society, which has triumphantly conquered the Air in our day, the older generation now alive in this year 1935 has grown up in the old assumption. The writer of this Study well remembers how, when he was a schoolboy, at the turn of the nineteenth and twentieth centuries, the possibility of effective flight by aircraft heavier than air was still a theme for tales of mystery and imagination in the vein of Jules Verne or Edgar Allan Poe.

When we turn from the physical to the human environment, we find the same. A challenge which has defeated one respondent is afterwards proved by a victorious response on the part of some later competitor to be not insuperable.

Let us reconsider, for example, the relation between the Hellenic Society and the North European barbarians. In a previous passage of this Part, we have already examined the effect of the pressure from the barbarians upon the Hellenic World;¹ but the pressure

¹ See II. D (v), pp. 160-6, above.

was reciprocal, and there was a counter-effect of Hellenic pressure upon the barbarians which has a bearing upon our present subject of inquiry. As the Hellenic Civilization radiated deeper and deeper into the continental European hinterland of the Mediterranean, one layer of barbarians after another was confronted with a question of life and death. Was it going to succumb to the impact of this potent alien social force and suffer a disintegration of its own social fabric in order to become raw material for assimilation into the tissues of the Hellenic body social? Or was it going to hold its own and resist assimilation and be enrolled, in virtue of its resistance, in the recalcitrant external proletariat of the Hellenic Society instead of merging its identity in that of the Hellenic Society itself? This challenge was presented by the Hellenic Civilization successively to the Celts and to the Teutons. In the earlier of these two ordeals, the Celts eventually broke down; but in the second ordeal the Teutons proved that the Hellenic challenge was not insuperable by responding to it victoriously now that their turn had come.

The break-down of the Celts was impressive, because the Celts had had a good start and had taken spectacular advantage of it to begin with. The Celts were given their opportunity by an error of tactics on the part of the Etruscan settlers along the west coast of Italy. These overseas converts to Hellenism were not content with securing their foothold on the Italian coastline nor even with expanding inland up to the foot of the Apennines. The Etruscan pioneers rashly crossed the Apennine watershed and scattered far and wide over the Basin of the Po right up to the foot of the Alps.¹ In expanding on this scale, they were vastly overtaxing their strength; and the consequence was as auspicious for the Celts—who happened to be the layer of barbarians immediately affected—as it was disastrous for the Etruscans themselves. The sudden initial access of Etruscan pressure had stimulated the Celts to react against the aggressors;² and now an equally sudden relaxation of the pressure tempted the barbarians to pass over to the offensive. The result was a *furor Celticus* which was sustained for some two centuries.

Before the end of the fifth century B.C., a Celtic avalanche, descending from the Alps, overwhelmed the weak Etruscan outposts in the Po Basin. In the early decades of the fourth century, the invigorated barbarians were sweeping across the Apennines and sacking the walled cities of Italy, including Rome itself,³ and were

¹ See II. D (iii), pp. 85-6, and the present chapter, p. 276, above.

² The length of the time during which the Celts had been in contact with the Etruscans before their reaction took a violent form in the fifth century B.C. is emphasized by H. Hubert in *Les Celtes et l'Expansion Celtique jusqu'à l'Époque de la Tène* (Paris 1932, Renaissance du Livre), p. 331.

³ For Rome's recovery from the *Clades Alliensis* of 390 B.C., see II. D (iv), pp. 101-2, above.

sending out flying columns of raiders right to the extremity of the Italian Peninsula. A century later, they were playing the same havoc in Peninsular Greece. In 279 B.C. they burst through the northern bounds of Macedonia and remained masters for four years (279-276 B.C.) of a country which had just imposed its hegemony on all the other states of Greece and overthrown the Achaemenian Empire.¹ Their range of action was immense. One wing of the horde which had descended the Danube to fall upon the heart of the Hellenic World swerved eastward and crossed the Dardanelles instead of heading for Pella and Delphi; and these Celts made a permanent settlement—an Asiatic 'Galatia'—on the Anatolian Plateau. Other Celtic hordes, bursting out in the opposite direction, descended the Rhine and the Seine and the Loire to the shores of the Ocean and swept on—taking seas and mountains in their stride—some across the Channel into the British Isles and some across the Bay of Biscay or the Pyrenees into the Iberian Peninsula. Nor were these Celtic migrants mere marauders. Inept though they were in material technique—as they showed in their inability to master the forest²—the Celts nevertheless succeeded, under the stimulus which came to them from Etruria and Macedon and Marseilles, in developing a style of their own³ which is sufficiently distinctive to enable our modern Western archaeologists to plot out the course and extent of these Celtic migrations on the basis of the remains of the Celtic culture which have come to light.

During those two centuries of Celtic exuberance (*circa* 425-225 B.C.), it looked as though the Celts might actually overwhelm the Hellenic World by breaking into its citadels in Italy and Greece and enveloping its flanks in Spain and Anatolia simultaneously; and then, when this Celtic terror was at its height, the barbarians missed their chance. They were driven out and kept out of the Italian Peninsula by the Romans and out of the Greek Peninsula by the Antigonids. In Anatolia, the scourge of their marauding expeditions stimulated the local 'successor-states' of the Achaemenian Empire to co-operate to the extent of confining the obnoxious Celtic

¹ In the fourth century B.C., the Macedonians had committed the same error of tactics on their own continental European frontier that the Etruscans had committed on theirs a century earlier. King Philip Amyntou, the Macedonian counterpart of Peter the Great, had stimulated the Celts by extending his rule into the interior of the Balkan Peninsula; and thereafter Philip's son and successor Alexander the Great, and Alexander's general and local successor Lysimachus, had both diverted the energies of Macedonia from Europe to Asia, leaving the continental European frontier invitingly open for barbarian reprisals.

² See pp. 275-6, above.

³ The type of culture which, in the technical terminology of our archaeologists, is known as 'La Tène', after the site, at the outflow from the Lake of Neuchâtel, on which the first striking examples of this culture were unearthed. The five phases into which the La Tène culture is analysed by the archaeologists on the strength of its material remains are believed to cover, in all, a span of five centuries, from the fifth century to the last century B.C. See Hubert, *op. cit.*, and the *Cambridge Ancient History*, vol. vii, ch. ii.

intruders within narrow bounds in the least desirable part of the country. In the Balkan Peninsula, in the basins of the Maritsa and the Danube, the Celts were exterminated by the indigenous representatives of European barbarism—Thracians and Illyrians and the like—as soon as these had recovered from the first shock of the Celtic onslaught. In the Iberian Peninsula, they were rolled back by the North African barbarians who gave the Peninsula its Iberian name. The last hope for the Celts lay in Hannibal's brilliant attempt, in his passage of the Alps, to set the Celtic avalanche in motion again at its original starting-point;¹ and this hope was forlorn, since the hour of Hannibal's intervention was not the eleventh but the thirteenth. The definitive defeat of Hannibal by Rome in the last year of the third century B.C. spelled the doom of Hannibal's Celtic allies. It was thenceforth inevitable that the encounter between the Celtic barbarism and the Hellenic Civilization should end in a Celtic defeat, and that this defeat should be inflicted by Roman hands. Within little more than two centuries after the close of the Hannibalic War, the Celts had been absorbed into the Hellenic body social through being incorporated into the Roman Empire from the banks of the Po to the banks of the Rhine and the Danube and from Celtiberia to Gallograecia. They had been followed up by Roman Imperialism from the Continent on to the island of Britain and from the British mainland on to their last sanctuary on the Isle of Mona. Their discomfiture was complete.²

This disintegration of the Celtic layer of European barbarism by the radiation of Hellenism exposed the Teutonic layer, which lay next behind the Celtic, to the action of the same formidable disintegrating force. How must the prospects of the Teutons have appeared to a Hellenic historian—a Diodorus of Agyrium or a Strabo of Amaseia—who had lived to see Caesar conquer Gaul³ or to hear Caesar's successors debating whether it were worth their while to conquer Britain?⁴ With the Celtic *débâcle* in his mind, our

¹ See II. D (v), pp. 161-2, above.

² Hubert, in *op. cit.*, on pp. 155-6, writes the epitaph of the Celts in the following terms:

'La Civilisation de la Tène commence avec l'âge d'or de la civilisation grecque. Ce sont les innovations de celle-ci qui ont provoqué les innovations qui caractérisent celle-là. Les surfaces de contact se sont depuis lors régulièrement accrues et, malgré quelques apparences contraires, l'influence des Méditerranéens et la masse des importations—jusqu'à l'assimilation de la civilisation de la Tène par la civilisation romaine. . . .

'Mais ce que les hommes de la Tène ont emprunté, ils l'ont généralement adapté et transformé de la façon la plus originale. Jamais encore, dans la série des emprunts faits par les civilisations de l'Europe Centrale aux civilisations plus avancées du Midi, pareille originalité ne s'était révélée.'

³ The narrative of Diodorus's *A Library of Universal History* stops at Caesar's invasion of Gaul in the year 58 B.C.; but certain later events are mentioned by Diodorus incidentally: e.g. Caesar's crossing of the Rhine and invasion of Britain, as well as his death and apotheosis.

⁴ 'Caesar the God [i.e. Divus Julius] landed on the island [of Britain] on two occasions, but each time he withdrew again in a hurry without accomplishing anything much or

historian—quite rationally forecasting the future in the light of the past—would assuredly have been inclined to pronounce that, for the barbarians of Europe, the challenge of Hellenism was insuperable and that, however lustily the Teutons might storm and rage, as the Celts had once stormed and raged, at the first encounter with the pioneers of the conquering civilization, the Teutons, like the Celts, were bound to be discomfited in the long run.

An observer who had watched Caesar throw Teutonic Ariovistus, neck and crop, out of Gaul or Augustus push the Roman frontier forward from the Rhine to the Elbe, right into the Teutonic domain, would hardly have guessed that the boundaries of the Roman Empire on the European Continent were destined to relapse to the line of the Rhine and remain at the line of the Danube instead of continuing to advance, at the Teutonic barbarians' expense, until they reached a 'natural frontier' at the neck of the European Peninsula, along the lines of the Vistula and the Dniestr. Yet, in despite of the historical precedents, this was what actually happened. The Teutonic resistance to Roman expansion succeeded in compelling Roman statesmanship to accept the Rhine-Danube line—the longest line that it is possible to draw across the face of Europe—as the permanent European frontier of the Roman Empire; and, when once this was decided, the game was in the Teutons' hands and their ultimate victory was only a matter of time.

On a stationary military frontier between a civilization and a barbarism, time always works in the barbarians' favour;¹ and, besides this, the barbarians' advantage increases (to borrow Malthus's famous mathematical metaphor) in geometrical progression at each arithmetical addition to the length of the line which the defenders of the civilization have to hold. The unsubdued Teutonic tribesmen pressed ever harder upon the fine-drawn line of the Roman frontier along the Rhine and the Danube; and they were so far from being threatened by the fate of the Celts that they soon began to assume a threatening aspect themselves in Roman minds as the most for-

penetrating far into the interior. . . . Lately, however, some of the local chiefs have entered into friendly relations with the Government of Caesar Augustus by sending embassies and paying other attentions; and they have gone so far as to dedicate monuments on the Capitol and to place the whole island virtually at the Romans' disposal. There would be no advantage, however, in a military occupation of the island in view of the heaviness of the duties which the Britons are compelled, as it is, to pay to the Imperial Treasury on all imports from Britain into Gaul and exports from Gaul into Britain. (These exports consist of ivory bracelets and necklaces and amber beads and glass-ware and other rubbish.) A military occupation would not pay, because it would require at least one legion, with some cavalry, to extract revenue from the islanders by direct taxation, and the cost of this force would swallow up the net increase in receipts (allowing for the fact that direct taxation could not be imposed without a simultaneous reduction in the customs tariff). Nor could force be employed without a certain amount of risk.' (Strabo: *Geographica*, Bk. IV, ch. v. 3, pp. 200-1.)

¹ This law of the barbarian frontiers of civilizations is examined further in Part VIII, below.

midable contingent in the recalcitrant external proletariat by which the now stationary frontiers of the Empire had come to be encircled. The Teutons, unlike the Celts, were proof against the assaults of Hellenic culture, whether these were delivered by soldiers or by traders or by missionaries. Even when they succumbed, on the eve of their final military triumph, to the spiritual assault of the Syriac religion which had just conquered the Hellenic Society itself, they made their Christianity their own by opting for Arianism instead of adopting the Catholicism which became prevalent on the Roman side of the now fast-crumbling military front. And when the Roman Empire finally collapsed, and the Hellenic Society went into dissolution with it, the Teutons were in at the death. It was these representatives of continental European barbarism, rather than the Sarmatians and the Huns of the Eurasian Steppe or the Arabs and the Berbers of Afrasia, who delivered the *coup de grâce*. A Greek historian of the fifth century of the Christian Era—a Priscus or a Zosimus—would have been in no danger of making that mistake which might so easily have been made by a Diodorus or a Strabo some four centuries earlier. In an age when Visigoths and Vandals were harrying the Peloponnese and holding Rome to ransom and occupying Gaul and Spain and Africa and seizing the command of the Mediterranean, it had long ceased to be possible to argue that the challenge of Hellenic culture and Roman arms was insuperable for the barbarians of Europe, just because this challenge had once defeated the Celts. The Teutonic victory robbed the Celtic defeat, in retrospect, of the apparent historical significance which it had seemed to possess at the time when it had been consummated.

There are other obvious illustrations of the same theme in the realm of the human environment which we may cite more briefly.

For example, the spiritual poverty of the indigenous Roman religion presented a standing challenge to foreign religions when once Rome's military career had brought her into cultural contact with foreign communities. Was some alien religion to respond to this challenge victoriously by filling the awful void in Roman souls which had yawned open during the seismic convulsions of the Hannibalic War? The Roman *numina* knew no magic formula for closing this spiritual breach.¹ Would some foreign divinity close it by leaping in, as the mythical Curtius once upon a time had closed a physical abyss in the Roman forum? The Hellenic Dionysus leapt into the breach straightway and was straightway swallowed up without constraining the gulf to close over his head. Yet the sum-

¹ On this point, see Warde-Fowler, W.: *The Religious Experience of the Roman People* (London 1911, Macmillan), Lectures xiv and xv.

mary suppression of the Dionysiac propaganda in Roman Italy by the Roman authorities in the second century B.C. was after all no proof that this challenge of the Roman spiritual void was insuperable; for, where the Hellenic Dionysus suffered defeat, the Syriac Christ descended into hell and re-ascended as a victor. Five centuries after the suppression of the Bacchanalia by the Roman Senate in the year 186 B.C.,¹ the Roman Government itself acknowledged the victory of Christianity in the conversion of the Emperor Constantine the Great.

Again, the intrusion of Hellenism upon the Syriac World in the train of Alexander the Great presented a standing challenge to the Syriac Society. Was it, or was it not, to rise up against the intrusive civilization and cast it out? Confronted with this challenge, the Syriac Society made a number of attempts to respond; and all these attempts had one common feature. In every instance, the anti-Hellenic reaction took a religious movement for its vehicle.² Nevertheless, there was a fundamental difference between the first four of these reactions and the last one. The Zoroastrian and Jewish reactions were failures; the Nestorian and Monophysite reactions were failures; the Islamic reaction was a success.

The Zoroastrian and Jewish reactions were attempts to combat the ascendancy of Hellenism by bringing into action two religions which had both been rife already in the Syriac World before the calamity of the Hellenic intrusion befell it. In the strength of Zoroastrianism, the Iranians, who had been the political masters of the Syriac World before Alexander overthrew the Achaemenian Empire, rose up against Hellenism and expelled it, within two centuries of the conqueror's death, from all the region east of the Euphrates. At the line of the Euphrates, however, the Zoroastrian reaction reached its limit. The remnant of Alexander's conquests was salvaged for Hellenism by the intervention of Rome; and in A.D. 628, after the Arsacids and the Sasanids had been beating upon this Roman frontier for nearly 700 years, it actually stood perceptibly farther east than the line along which Pompey had first drawn it in 64 B.C.³ Thus the Zoroastrian reaction never succeeded in dislodging the intrusive alien civilization from the Syriac *terra irredenta*. Nor did the Jewish reaction succeed in its more audacious attempt to liberate the homeland of the Syriac Civilization from the Hellenic incubus by an uprising from within. The Jewish people was too weak in arms and numbers and Syria lay too near to the reservoirs of Hellenic energy for the Jewish reaction to be able to achieve even that measure of

¹ See II. D (vi), pp. 215-16, above.

² See I. C (i) (b), vol. i, pp. 90-2, and II. D (vi), pp. 234-6, above.

³ See I. C (i) (b), vol. i, pp. 75-6, above.

success which was achieved by the Zoroastrian reaction; and the momentary triumph of the Maccabees over the Seleucids was effaced by an overwhelming disaster when the Romans intervened. In the great Romano-Jewish War of A.D. 66-70, the Jewish community in Palestine was ground to powder; and the Abomination of Desolation, which the Maccabees had once cast out from the Holy of Holies, came back to stay when Hadrian planted on the site of Jerusalem the Roman colony of Aelia Capitolina. The debris of this devoted Syriac people which took up the Hellenic challenge so gallantly and was shattered so remorselessly by the impact of Rome is drifting about in the World down to this day, as the ash-dust once floated in the atmosphere, and tinged the colours of the sunset on the other side of the planet, for weeks after the great eruption of Krakatoa. This pulverized social ash is familiar to us as the Jewish 'Diaspora'. The scattered survivors of Jewry are left with the cold consolation of remembering that their forefathers volunteered on a forlorn hope and went down to destruction in a splendid failure.

As for the Nestorian and Monophysite reactions, they were two alternative attempts at turning against Hellenism a weapon which the intrusive civilization had forged for itself from a blend of Hellenic and Syriac metal. In the syncretistic religion of Primitive Christianity, the essence of the Syriac religious spirit had been Hellenized to a degree that rendered it congenial to Hellenic souls;¹ and, for the Syriac underworld, this was perhaps the bitterest fruit of the Hellenic ascendancy. The Hellenic dominant minority had discovered the pearl of great price that lay buried in the field of Syriac culture, and now the hated intruder was actually carrying this precious Syriac heirloom away. The Nestorian and Monophysite reactions were attempts to snatch Christianity out of those sacrilegious Hellenic hands and to save it for the Syriac heirs of the Heavenly Kingdom. They were attempts to de-Hellenize Christianity and thereby to restore it to a pristine Syriac purity. Yet the Nestorian and Monophysite reactions failed in their turn; and they both really failed in the same way, in spite of the diversity of their theological tenets and their political fortunes. It made little difference that their theological divergences from the middle path of the Catholic Faith were in diametrically opposite directions to one another. It made little difference that Nestorianism was ignominiously driven out beyond the bounds of the Roman Empire to consort with Zoroastrianism in the limbo east of Euphrates, whereas Monophysitism held its ground in Syria and Egypt and Armenia, and defied the Melchite hierarchy, without being blasted—as Judaism had

¹ Mithraism, which was Christianity's contemporary and its most formidable rival in the competition for the spiritual conquest of the Roman Empire, was of a corresponding alloy. It was a Hellenized version, not of Judaism, but of Zoroastrianism.

been blasted in an earlier encounter—by the Roman thunderbolt. The fundamental reason why Nestorians and Monophysites both alike failed was that both were attempting an impossible feat of spiritual alchemy. The Hellenic alloy which both were seeking to eliminate from Christianity was really indispensable. Christianity was a syncretism or nothing; and although either one of the two blended elements might be reduced to a minimum by the alchemist's art, it could never be reduced to zero. By reducing the Hellenic element in Christianity as far as they could, the Nestorians and Monophysites were merely impoverishing Christianity without being able to rid it completely of the foreign alloy which, on a Syriac valuation, was so much intractable dross. The Nestorians and Monophysites were not so much defeated by the resistance of the Melchites as they were paralysed by an irreconcilable contradiction in their own souls. A religion which contained an irreducible residuum of Hellenism in itself could never inspire a whole-hearted anti-Hellenic crusade.

A Greek contemporary of the Emperor Heraclius, who had witnessed the ultimate victory of the Roman Empire in its last trial of strength with the Sasanidae and the ultimate victory of the Melchite hierarchy in its last trial of strength with the Nestorian and Monophysite heretics, might have been betrayed, about the year 630 of the Christian Era, into giving thanks to God for having made the Earthly Trinity of Rome and Catholicism and Hellenism invincible. First Zoroastrianism and Judaism, and then Nestorianism and Monophysitism, had taken up the Hellenic challenge, and now all these Syriac reactions had failed to achieve their common aim. Surely these four failures were conclusive proof that the challenge presented by the ever dominant Hellenism to the ever prostrate Syriac Society was insuperable?

In the year 630, this conclusion would have forced itself upon the reason of almost any intelligent citizen of the Catholic Graeco-Roman Commonwealth, to whichever side his personal sympathies might happen to incline. And yet, at that very moment, the fifth Syriac reaction against Hellenism was impending; and this fifth reaction was to give the lie to the apparent significance of the other four by succeeding triumphantly where they had all failed alike. The Emperor Heraclius himself, who had spent his life in vindicating the work of Alexander and Pompey, was condemned by a malicious Destiny not to taste of death until he had seen 'Umar the Successor of Muhammad the Prophet coming into his kingdom to undo Alexander's work and Pompey's work and Heraclius's own work—and this utterly and for ever. For Islam accomplished everything which Judaism and Zoroastrianism and Nestorianism and

Monophysitism had severally and successively attempted in vain. It completed the eviction of Hellenism from the Syriac World. It reintegrated, in the shape of the 'Abbasid Caliphate, the Syriac universal state which Alexander had ruthlessly cut short, before its term had run out or its mission been fulfilled, when he overthrew the Achaemenidae. Finally, Islam endowed the Syriac Society, at last, with an indigenous universal church and thereby enabled it, after centuries of suspended animation, to give up the ghost in the assurance that it would not now pass away without leaving offspring. When the 'Abbasid Caliphate broke up and the Syriac Society went into a tardy dissolution, the Islamic Church became the chrysalis out of which the new Arabic and Iranic civilizations, 'affiliated' to the Syriac Civilization, were to emerge in due course at the end of a post-Syriac interregnum.¹

We may also reconsider, from our present standpoint, the challenge which was presented to Western Christendom by the impact of the Ottoman Power. During the fourteenth century of the Christian Era, the 'Osmanlis had succeeded in imposing the Pax Ottomanica upon the warring communities of Orthodox Christendom in the Balkan Peninsula. By the turn of the fourteenth and fifteenth centuries the issue between Orthodox Christendom and the 'Osmanlis was closed, and a new issue was presented. Were the warring communities of Western Christendom to have peace imposed on them now, as it had been imposed on the warring communities of Orthodox Christendom already, by the drastic discipline of an Ottoman conquest? Or would the Western Society succeed in effectually countering this danger by evolving from its own body social some kind of carapace which would be sufficiently broad and thick and tough to be impervious to Ottoman blows?

In the fifteenth century this protective function was assumed by the Kingdom of Hungary and, after a century-long ordeal, it proved to be beyond Hungary's permanent capacity. Hungary's failure was dramatically proclaimed in her crushing defeat at the hands of Sultan Suleymān in the Battle of Mohacz; and we may imagine some Venetian observer who had escaped from the battle-field alive reporting home that the 'Osmanlis were invincible and advising the Government of the Republic to agree with their Ottoman adversary quickly while they were in the way with him, before his cavalry had time to cross the Julian Alps and descend upon the Venetian possessions on the Italian mainland. On the morrow of the Battle of Mohacz, it might indeed have appeared to the shrewdest judge of public affairs that the Ottoman challenge to Western Christendom was unanswerable. Yet this judgement was invalidated, before

¹ See I. C (i) (b), vol. i, pp. 72-7, above.

the calendar year was out, by the establishment of the Danubian Hapsburg Monarchy.

This 'ramshackle empire' must indeed have appeared, at the moment of its improvisation, to be a house built on the sands, which was bound to fall as soon as ever 'the rain descended and the floods came and the winds blew and beat upon' it.¹ How could this jerry-built structure be expected to stand when the house of Hungary had fallen? Hungary had been a historic kingdom with a tradition and an *esprit de corps*. The Danubian Hapsburg Monarchy was a pile of rubble thrown together out of the nearest materials that came to hand: an incongruous amalgam of Hungarian debris, salvaged from Ottoman clutches, with a miscellaneous backing of half a dozen contiguous kingdoms and lands: the marches of Styria and Austria, the duchies of Carinthia and Tyrol, the Kingdom of Bohemia. Surely this new Danubian Hapsburg Monarchy could not succeed where the old Kingdom of Hungary had failed? Surely it must fall, with a greater fall than that of Hungary, when the Ottoman conqueror resumed his offensive? Such expectations, which assuredly were prevalent in rational minds in A.D. 1526, were nevertheless destined to be falsified in 1529 and refuted for ever in 1683. In the first siege of Vienna, the Danubian Hapsburg Monarchy survived the impact of the force to which Hungary had succumbed on the field of Mohacz. In the second siege of Vienna, the Ottoman Power was thrown into a recoil from which it never rallied. Thus the outcome of the Battle of Mohacz was not, after all, a proof that the Ottoman challenge was unanswerable for the Western World. So far from that, the shattering of the first anti-Ottoman carapace of Western Christendom actually stimulated the threatened society to provide itself with a new carapace of sufficient massiveness to withstand the blows under which the original carapace had given way.

The foregoing examples indicate that we have not yet found the right method for dealing with the problem now before us. We are concerned at the moment to lay hands on unequivocal instances—if such are to be found—in which a challenge has proved to be excessive, and we have now ascertained empirically that we cannot reach our goal by the process of demonstrating that some challenge has been too much for a particular respondent on a particular occasion or even for a succession of respondents on a series of occasions. However long the catalogue, the demonstration is bound to be incomplete because we cannot here apply the method of exhaustion. The inference suggested by a thousand successive failures may be invalidated, at the thousand-and-first encounter,

¹ Matthew vii. 25.

by a single anomalous and quite unpredictable success. This method of inquiry, therefore, is a false route, and we must make for our goal along some other line of approach.

Comparisons in Three Terms.

Can we see some alternative method of research that promises better results? Let us try the effect of starting our inquiry from the opposite end. We have made no progress when we have started from instances in which a challenge has defeated a respondent. Let us now start from instances in which a challenge has administered an effective stimulus and has evoked a successful response. In previous chapters of the present Part, we have had occasion to examine many instances of this kind, and in many of these cases we have conducted our examination comparatively. We have compared the example of a successful response to a challenge with some other historical situation in which the same party (or a comparable party) has responded with less success to the same challenge (or to a comparable challenge) when the challenge has been less severe. Let us now reconsider some of these comparisons between two terms and see whether we cannot increase our two terms of comparison to three.

Let us look in each case for some third historical situation in which the challenge has been not less severe but more severe than in the situation from which we have started. If we succeed in finding a third term of this kind, then the situation from which we have started—a situation in which it is already established, by empirical observation, that our challenge does evoke a successful response—becomes a middle term between two extremes. At these two extremes, the severity of the challenge is respectively less and greater than it is at the mean. And what about the success of the response? In the situation in which the severity of the challenge is less than the mean degree, we know that the success of the response is likewise apt to be less than it is in the middle term. We have still to ascertain what kind of response is evoked in our third situation: the situation in which the severity of the challenge is above the mean and not below it. Here, where the severity of the challenge is at its highest, shall we find that the success of the response is at its highest also? Suppose that we find, on examination, that an enhancement of the severity of the challenge above the mean degree is not accompanied by any corresponding increase in the success of the response but that, on the contrary, the response actually falls off, just as it falls off when the severity of the challenge is not enhanced but diminished? If this proves to be the outcome of our inquiry, we shall have discovered that the interaction of Chal-

allenge-and-Response is subject to the well-known 'law of diminishing returns'. We shall conclude that there is a mean range of severity at which the stimulus of a challenge is at its highest; and—assuming that the height of the stimulus is our criterion of value—we shall call this degree of severity the optimum. On this standard, we shall pronounce certain presentations of a given challenge to be 'defective', and certain other presentations of the same challenge to be 'excessive', on the common ground that both alike are apt to evoke less successful responses than those which are evoked by the challenge at the optimum degree at which its effect upon respondents is the most stimulating. Having sketched this new line of inquiry, let us follow it out in order to discover experimentally whether it does lead us to the goal for which we are making.

Norway—Iceland—Greenland

For example, let us reconsider the stimulating effect which was produced upon the Norsemen by their transmarine migration from Scandinavia to Iceland. The effect is indisputable. It was in Iceland and not in Norway or in Sweden or in Denmark that the abortive Scandinavian Civilization achieved its greatest triumphs both in literature and in politics.¹ And what were the conditions of the stimulus that evoked this supremely brilliant response? There are two conditions which are conspicuous: the transmarine migration across arctic seas and the exchange of a bleak and barren country-side in Norway for an Icelandic country-side which was bleaker and barrenner. As far as we can judge, these two conditions together constituted the Icelandic challenge which stimulated the Scandinavian Society to surpass itself. Now, suppose that the same challenge had been repeated with redoubled severity; suppose that the Norsemen had been challenged by their physical environment to traverse twice the width of arctic waters that separates Iceland from Scandinavia, and to settle on the farther shore in a country-side which was as much bleaker and barrenner than Iceland as Iceland itself is bleaker and barrenner than Norway. Would this repetition of the same challenge with twice its Icelandic severity have resulted in a repetition of the Scandinavian response with twice its Icelandic brilliance? Would this Thule beyond Thule have bred a Scandinavian community whose literature had twice the literary merit of the Icelandic Saga and their polity twice the political genius of the Icelandic Commonwealth? This question is not hypothetical; for the conditions which we have postulated were actually fulfilled when the Scandinavian seafarers pushed on from Iceland to Greenland. And the answer to the question is not uncertain; for the

¹ See II. D (iii), pp. 86-100, above.

brilliance which the Scandinavian culture had attained in Iceland was nowhere and never surpassed. Though Greenland supplanted Iceland as the Ultima Thule of the Scandinavian World, it did not supplant it as the focus of Scandinavian culture. The height to which that culture had risen in Iceland remained its zenith.

As it turned out, the conditions of enhanced severity, which had evoked so brilliant a response from the Norsemen who migrated from Norway to Iceland, brought in diminishing returns when they were imposed upon the emigrants to Greenland in double measure. The Greenlanders made hardly any contribution to Norse literature;¹ they did not distinguish themselves in politics; and they betrayed a most un-Scandinavian-like lack of drive in failing to follow up and clinch the great geographical discovery—the discovery of America—which was within their grasp.

By the time when they had reached Greenland, the Scandinavian explorers had attained the threshold of the New World. They had already put behind them the longest and most formidable stage of the journey. The relatively clement south-west coast of Greenland, which they had chosen for the site of their settlements, faces the north-east coast of Labrador across waters that are scarcely wider than the North Sea; and this side of Greenland is not more distant from the Gulf of St. Lawrence than it is from Iceland. Within the forty years immediately following the Norse colonization of Greenland in A.D. 985–6, there were no less than five separate occasions on which Norse voyagers, sailing for Greenland or from Greenland, accidentally or deliberately made the North American coast.² It is remarkable that these Scandinavian voyages to America all occurred during the first four decades of an occupation of the adjacent coast of Greenland which lasted altogether for more than four centuries; and the failure to follow these reconnaissances up appears all the more extraordinary when we bear in mind the usually high standard of adventurousness and hardihood which prevailed among the Scandinavian seafarers in general in the Viking Age. Moreover, in this instance, the Scandinavian settlers in Greenland had a special incentive for indulging in the traditional Viking diversion and exercising the traditional Viking virtue. Over a span of little less than half a millennium, the Greenlanders were being slowly worsted in a tragic losing battle against a physical environment which was too severe for even the Scandinavian spirit to endure permanently the ordeal of keeping alive in it. During all this time, there was knowledge in Greenland of a temperate country to the south—a land of vines—which had been proved to be within sailing distance

¹ They are credited with the so-called 'Greenlandic Atli Lay' in the Poetic Edda.

² See Gathorne-Hardy, G. M.: *The Norse Discoverers of America* (Oxford 1921, Milford); and Kendrick, T. D.: *A History of the Vikings* (London 1930, Methuen), ch. xv.

of Greenland by the voyages of the Greenlanders' own ancestors. Yet the descendants of the Scandinavian heroes who had made their way across the Arctic Ocean to Greenland as a work of super-erogation, almost for the sport of braving the elements, were not spurred on by the imminent danger of extinction in their Greenlandic settlements to save their souls alive by making the easier transit to Vinland. They did not follow in the wake of their inquisitive ancestors in order to find new homes in a temperate clime where they and their descendants could look forward to living in perpetuity a life of reasonable ease.¹

What are we to make of this strange and melancholy story? Its meaning surely is that the challenge of Greenland was excessive, and that the reason why the abortive Scandinavian Civilization actually attained its zenith neither in Greenland nor in Norway but in Iceland was that in Iceland the challenge to which the Scandinavian Civilization was the response happened to be presented in the optimum degree of severity—a degree which was a mean between the lesser and the greater degree of severity in which the same challenge was presented in Norway and in Greenland respectively.

Dixie—Massachusetts—Maine

The Vinland on which the Scandinavian seafarers had failed to secure a foothold at the turn of the tenth and eleventh centuries of the Christian Era was successfully colonized, rather more than six centuries later, by English maritime pioneers of Western Christendom who boldly steered straight across the open Atlantic instead of skirting the great Oceanic void and following the Scandinavian route through arctic waters where Iceland and Greenland offer themselves as stepping-stones. This bold Western seamanship had its reward; for New England—as Vinland was christened by English colonists who made themselves at home there in the seventeenth century—presented a physical challenge which had a potent stimulating effect. We have studied this physical challenge on the site of Town Hill, Connecticut;² and we have traced the steps by which the New Englanders were led on to the mastery of the whole North American Continent through their successful response to the severe conditions of the New England environment.³ We have seen how, in the last round of the struggle between the diverse communities which had been established by European colonists along the Atlantic seaboard of North America, the New Englanders 'knocked out' their Southern kinsmen whose ancestors had likewise braved the perils of the passage from England across the open

¹ For traces of abortive attempts at later dates, see Gathorne-Hardy, *op. cit.*, pp. 282-97. ² See II. D (i), pp. 15-16, above. ³ See II. D (ii), pp. 65-70, above.

Atlantic in the seventeenth century, but had settled in the treacherously genial clime of Virginia and the Carolinas. After two and a half centuries of exposure, in their respective settlements overseas, to the relaxing climate of the South and to the stimulating climate of New England, these two offsprings of a single English stock had been differentiated to a degree of which the measure is given by the outcome of the American Civil War. Evidently the challenge of the physical environment, which has evoked such a triumphant response at the degree of severity in which it is presented in New England, remains stimulating at the somewhat milder degree in which it is presented in New York State and New Jersey and Pennsylvania, but becomes distinctly relaxing at the lower degrees to which it falls on the southern side of the Mason and Dixon Line. In geographical terms, we may say that, along the North American Atlantic seaboard, the Mason and Dixon Line marks the southward limit of the optimum climatic area—in the sense of the area in which the challenge of the physical environment evokes the most effective human response. We have now to ask ourselves whether this area of highest climatic stimulus has another limit on the northern side; and, as soon as we have framed this question, we are aware that the answer is in the affirmative.

The northern limit of the optimum climatic area actually partitions New England; for New England, small as it is compared to the whole range of the North American seaboard from Florida to Labrador, is by no means homogeneous within itself. When we speak of New England and the part which it has played in North American history, we are really thinking of three New England States out of the five: of Massachusetts and Connecticut and Rhode Island rather than New Hampshire or Maine; though the two latter states have just as good a title to the family name of New England as their three more distinguished sisters.¹ Historically, Maine is a mere offshoot of Massachusetts; and she only acquired her separate statehood in the year 1820, at a date when the Commonwealth of Massachusetts, with Maine as its annex, had already been in existence for the best part of two centuries. Thus the tie between Maine and Massachusetts is perhaps as close as that between any two other states in the Union.² The combined influences of geographical propinquity and common racial stock and common tradition and long-maintained common government have been at work to hold these two New England States together. And yet the

¹ This cannot be said for the state of Vermont, which falls into the same group as New Hampshire and Maine sociologically, but is historically an offshoot of New York State and therefore not strictly a part of New England by origin.

² It is certainly closer than the tie between Virginia and West Virginia or between North and South Carolina.

diversity of their history up to date and of their character at the present time is extreme.

Massachusetts has always been one of the leading English-speaking communities on the North American Continent. She has succeeded in maintaining this position in spite of the immense political and economic changes which, in the course of the last hundred and fifty years, have accompanied and followed the establishment of the Union and the expansion of the United States across the continent from Atlantic to Pacific. On the other hand, Maine has always been unimportant and obscure, not only before but since her erection into a separate State. Massachusetts to-day is still one of the principal seats of North American industrial and intellectual activity, while Maine survives as a kind of 'museum piece'—a relic of seventeenth-century New England, a land of woods and lakes which is still inhabited by woodmen and watermen and hunters. These children of a hard country now eke out their scanty livelihood by serving as 'guides' for the pleasure-seekers who come from far and wide out of the North American cities to spend their holidays in this Arcadian State, just because Maine is still what she was at a time when many of these great cities had not yet begun to arise out of the virgin wilderness. Maine to-day is at once one of the longest-settled regions within the frontiers of the Union and one of the least urbanized and least sophisticated.

How is this contrast between Maine and Massachusetts to be explained? It would appear that the hardness of the New England environment, which stands at its optimum in Massachusetts, is accentuated in Maine to a degree at which it brings in diminishing returns of human response to its challenge. In other words, the optimum climatic area along the North American Atlantic seaboard has a northern limit at the northern boundary of Massachusetts which corresponds to its southern limit at the more celebrated Mason and Dixon Line. If it is a fact that, beyond the southern boundary of Pennsylvania, the challenge of the physical environment becomes deficient in severity and therefore positively relaxing in its effect upon human energies, it is also a fact that, beyond the northern boundary of Massachusetts, the same challenge becomes excessive in severity and therefore repressive. And, in terms of the human response, the effects of repression and of relaxation are identical. In areas in which either of these two conditions prevails, the human respondent to the challenge is not stimulated to respond with as great effect as in the optimum area in which the highest physical stimulus is administered by a challenge of mean severity between the relaxing and the repressive extreme.

The operation of 'the law of diminishing returns', which begins

to reveal itself in the contrast between Maine and Massachusetts comes out much more clearly if we extend our survey farther northwards to the rest of the English-speaking communities along the Atlantic seaboard of North America. New Brunswick and Nova Scotia, which occupy the mainland between Maine and the Gulf of St. Lawrence, are the least prosperous or progressive provinces of the Dominion of Canada with the exception of their north-eastern neighbour, Prince Edward Island. On the northern side of Cabot Strait, the Island of Newfoundland is the least reputable of all the self-governing communities of the British Commonwealth of Nations.¹ On the northern side of the Strait of Belle Isle, the English-speaking fisherfolk along the bleak and barren north-east coast of Labrador are fighting, at this day, the same tragic losing battle against overwhelming physical odds that was once fought out to the death, on the opposite side of Davis Strait, along the south-west coast of Greenland, by those forlorn Scandinavian pioneers whose last survivors perished some five centuries ago.

Brazil—la Plata—Patagonia

If we turn our attention to the Atlantic seaboard of South America, we shall observe the same phenomena there *mutatis mutandis*. In Brazil, for example, the greater part of the national wealth and equipment and population and energy is concentrated in the region lying south of the 20th degree of southern latitude and east of the River Paraná. This region is only a small fraction of the vast territories of the Republic, yet in social importance it far outweighs the much larger fraction that extends along the Atlantic coast from the 20th parallel up to the point where this coast strikes the Equator at the mouth of the Amazon (not to speak of the vast hinterland, which includes almost the whole of the Amazon Basin). Moreover, Southern Brazil itself is inferior in civilization to the adjoining regions that lie still farther south: the Republic of Uruguay and the Argentinian State of Buenos Aires. It is evident that, along the South American Atlantic seaboard, the equatorial sector is not stimulating but positively relaxing, and that the optimum climatic area—in the sense of the area in which the challenge of the physical environment evokes the most effective human response—begins south of the 20th parallel (south) and is nearer to its best in the neighbourhood of the Rio de la Plata than in the neighbourhood of the Tropic of Capricorn.

Where, then, is 'the high light' of this optimum area to be found?

¹ This passage was written before the suspension of the constitution of Newfoundland, and the re-assumption of a certain measure of local financial and administrative responsibility and control on the part of the Government of the United Kingdom, at the end of A.D. 1933.

The city of Buenos Aires has the advantage over the city of Rio de Janeiro by some dozen degrees of latitude. If we follow the coast farther southward through another dozen degrees of latitude beyond Buenos Aires, shall we find ourselves in a region which is as much superior in civilization to Central Argentina as Central Argentina is to Southern Brazil? The answer is in the negative. We shall actually find the vigour and effectiveness of the human response to the physical environment beginning to fall off before we have rounded the bight of Bahia Blanca and reached Parallel Forty. Farther south than that, we shall find ourselves traversing the bleak plateau of Patagonia which is still tenanted by a stalwart but sparse and primitive population of vagrant hunters. If we push on still farther south again and cross the Strait of Magellan, we shall find ourselves among the numbed and starved savages who just manage to keep alive among the frosts and snows of Tierra del Fuego. Thus in the Southern, as in the Northern, Hemisphere the Atlantic seaboard of America contains an optimum climatic area which has limits in both directions. In either hemisphere, this area in which the physical environment evokes the most effective human response passes over on the one side into an area in which the challenge is not of sufficiently stimulating severity and on the other side into another area in which the challenge is so severe that its excessive stimulus brings in diminishing returns.

The Pacific Seaboard of South America

Let us next re-examine the Pacific seaboard of South America, which has engaged our attention before. We have observed¹ that the original home of the Andean Civilization on this seaboard lay, not in Valparaiso or in any of the other green valleys which open out upon the Central Chilean sector of the coast south of the 30th parallel, but among the oases which hold their own against the coastal desert along the North Peruvian coast, from the Tumbes Valley on the north to the Nazca Valley on the south inclusive. We have also observed that, in Valparaiso, the physical environment does not present that challenge which is presented in the valleys of Tumbes and Chimú and Rimac and Nazca: a challenge which once evoked the Andean Civilization as the human response to it. The North Peruvian Coast has given birth to an indigenous civilization because of its relative severity, and the Central Chilean coast has failed to do the like because of its relative geniality. Are we to infer that other sectors of the South American Pacific coast would have evoked still more vigorous and effective human responses than the North Peruvian coast, supposing that the physical challenges which

¹ See II. C ii) (b) 2, vol. i, pp. 322-3, above.

they presented to Man had only been still more severe? The answer is in the negative; for any such fancy is ruled out by the fact that two coasts of this very character are actually to be found in immediate proximity to the North Peruvian coast, on either side of it, and that neither of these still more forbidding stretches of coast has been any more successful than the less forbidding coast of Central Chile in emulating the unique cultural achievement which the North Peruvian coast has to its credit. Certainly the Andean Civilization did not emerge in the Earthly Paradise of Central Chile; but neither did it emerge in the unmitigated desert which dominates the seaboard of Northern Chile and Southern Peru between the 30th parallel and the 15th; nor again did it emerge in the tropical forest which smothers the seaboard of Ecuador.

On these two latter stretches of coast, the challenge of the physical environment was presented with an excess of severity which is well brought out in the following descriptions by an expert hand:

'Along the Ecuadorian coast, conditions prevail which accord with the usual conception of the tropical environment; for in that part of the Andean area there exist tangled forests crowded with unkempt trees draped in trailing mosses: forests wherein Man must combat warm, humid, and enervating air and a too-luxuriant vegetation, not to mention vast stretches of marsh or of spongy, unwholesome soil. . . . The island of Puna, at the mouth of the Guayas River, presents a delightful park-like aspect, embellished by sightly trees that raise graceful heads above the general expanse of grass and low shrubs. But even this comparatively charming part of the coast is replete with swamps, formerly the abode of yellow-fever mosquitoes. . . . Coastland Ecuador . . . varies . . . within itself to a marked degree, some of it being, seemingly, almost incapable of supporting human society, the rest of it being, apparently, not unpropitious to Mankind. Yet in no part of it, so far as we now know, was any well-balanced culture produced and set upon a rational career. True, manifestations of advanced material culture—stone-carving, pottery-making, &c.—have been discovered there by archaeologists; but . . . they are almost certainly the product, in every case, of cultural influences from outside the region. Thus, as a whole, the Ecuadorian coast is one of those habitats wherein Man was unable to progress without help from outside—or at any rate did not—but wherein, once advanced culture was introduced, it could be carried on.'¹

As for the Peruvian coastal desert, it

'is not uniform throughout its length; for in the northern half of the Peruvian coast it is low—some three or four hundred feet, at most, above the valley floors—and it slopes perceptibly towards the sea. . . . In the southern part of the coast, on the other hand, the desert plain lies at an altitude of two or three thousand feet above the sea, and the river itself,

¹ Means, P. A.: *Ancient Civilisations of the Andes* (New York 1931, Scribner), pp. 6-7.

at a distance of only twenty miles from its mouth, is, as in the case of the Majes River, at an altitude of a thousand feet or more and is hemmed in inexorably by the adjacent but even higher desert plains. It is little to be wondered at, therefore, that in valleys of this type—let us say, from that of Lomas southwards into Northern Chile—no great cultural advances were ever made save as the result of outside influences.¹

Thus the stimulating desert of the North Peruvian coast is succeeded, farther south, by a repressive desert which reaches its acme of oppressiveness in the Nitrate Coast: a howling wilderness which has only become a bone of contention between three Latin-American Republics in these latter days when its chemical deposits have acquired a commercial value.

'There is in Northern Chile none of the scenic beauty that marks the change from bleak mountains to the warm, green valleys of the coastal desert of Peru. In the latter case, the streams reach the sea, and the valley walls enclose cultivated fields that fill the valley floor. In Peru the picture is generally touched with color—a yellow, haze-covered horizon on the bare desert above, brown lava-flows on the brink of the valley, grey-brown cliffs, and greens ranging from the dull shade of *algarrobo*, olive and fig trees to the brightness of freshly irrigated alfalfa meadows. In Northern Chile there is no hint of water until one reaches the foothills of the Andes far beyond the Coast Range and across the intervening desert. Where water occurs it is so small in volume that its effects are almost completely hidden in the depths of steep-walled ravines, so that in many places one may look for miles along the Andes without seeing a single trace of vegetation or human life.'²

It will be seen that, in point of severity, the Pacific seaboard of South America from the 5th to the 15th parallel (south) presents a challenge which is a mean between two extremes, like the Atlantic seaboard of the same continent from the 20th to the 40th parallel or the Atlantic seaboard of North America from the 39th to the 43rd parallel (north), or again like Iceland. In Iceland, the challenge of the physical environment is a mean between extremes in Norway and in Greenland; in Massachusetts it is a mean between extremes in South Carolina and in Labrador; in Uruguay it is a mean between extremes in Amazonia and in Tierra del Fuego. Similarly, on the North Peruvian seaboard of South America, which has given birth to the Andean Civilization, the challenge of the physical environment is a mean of optimum severity between the excessive geniality of Central Chile and the excessive severity which is displayed, in diverse ways, by both the Nitrate Coast and the seaboard of Ecuador.

This Andean illustration is perhaps more illuminating than the

¹ Op. cit., pp. 12-13.

² Bowman, I.: *Desert Trails of Atacama* = American Geographical Society Special Publication No. 5 (New York 1924, American Geographical Society), pp. 11-12.

others, just because its geographical and climatic expression works out less simply than theirs. In all the other instances above cited, the mean or optimum challenge is presented in an area which happens to be situated geographically in between the two areas in which the challenge is respectively insufficient and excessive. In the two other American instances, again, the mean challenge coincides with a climatic mean of relative temperateness between two climatic extremes which verge respectively towards tropical and towards arctic conditions. In the Andean instance, on the other hand, the excessive challenge is presented alike by two areas which are situated on opposite sides of the optimum area and which have nothing in common with one another in their climates—one being a humid region smothered under a tropical forest and the other an arid region where inorganic chemical deposits coat an otherwise naked desert. The insufficient challenge, again, is here presented in an area which is not sub-tropical but temperate in climate, and which is separated geographically from the area of optimum challenge by one of the two areas in which the challenge is excessive. In this Andean instance, therefore, the 'mean' which we are studying cannot be mistaken for anything but what it really is. Here, clearly, it has nothing to do with a geographical 'mean' in the sense of a central location, or again with a climatic mean in the sense of a climate that is relatively temperate. It reveals itself unmistakably as a 'mean' between a greater and a lesser degree of severity in a challenge presented to Man by his Environment—a 'mean' which is also an 'optimum' because, at this mean degree of severity, the challenge evokes a more vigorous and more effective human response than is evoked by it either when its severity is greater (for whatever reason) and therefore 'excessive' or again when it is less and therefore 'insufficient' from the standpoint of the human respondent.

In the light of this Andean illustration, we can now pursue our survey with clearer insight.

Votyaks—Magyars—Lapps

Another illustration of the working of this law is offered by the migrations of the Finnish-speaking peoples. From their original habitat at the east end of the North European forest, astride the Urals, where some of these peoples have never ceased to live their old life in its old environment, other peoples of the same family have migrated into one or other of the two regions of entirely different physique which adjoin the forest-belt on the north and on the south. The ancestors of the Lapps, migrating northwards, have exposed themselves to the challenge of the Tundras, while the ancestors of the Magyars, migrating southwards, have exposed

themselves to the challenge of the Eurasian Steppe. The social consequence of the change in physical environment has been very different in these two cases.

‘The consanguineity of the Hungarians and Laplanders would display the powerful energy of climate on the children of a common parent; the lively contrast between the bold adventurers who are intoxicated with the wines of the Danube and the wretched fugitives who are immersed beneath the snows of the polar circle. Arms and freedom have ever been the ruling, though too often the unsuccessful, passion of the Hungarians, who are endowed by Nature with a vigorous constitution of soul and body. Extreme cold has diminished the stature and congealed the faculties of the Laplanders; and the Arctic tribes, alone among the sons of men, are ignorant of war and unconscious of human blood: an happy ignorance, if reason and virtue were the guardians of their peace!’¹

The Lapps on their Tundras have sunk considerably below the level of their sylvan ancestors; the Magyars on the Hungarian Alföld have risen far above it. It is evident that the ordeal of exchanging the life of the forests for the life of the Steppes is sufficiently severe to be stimulating, whereas the change from forest to Tundra is so inordinately severe that its effect on those who have endured it has been, not stimulating at all, but positively repressive.

Reactions to Changes of Climate

Let us next consider the effect of migration from countries with a damp, cloudy, foggy, heavy climate—the climate which prevails in England and along the adjoining continental coasts of the North Sea from Flanders to Jutland—to countries with climates that are drier, sunnier, clearer, and lighter. In the course of our Western history, a change of climate in this direction has been made by the medieval emigrants from the original Duchy of Saxony to the new marches wrested from the Slavs beyond the Elbe.² In modern times, a similar change has been made by the Dutch emigrants to the Transvaal and by the English emigrants to New England. In each of these three cases the change of climate has produced on those who have made it a stimulating effect which can be measured at the present day in the difference of *ethos* between the Brandenburger and the Hanoverian or between the Afrikaner and the Hollander or between the Yankee and the Englishman. In regard to this stimulus, however, a distinguished American climatologist strikes a warning note:

‘The people of the Eastern and Central United States are more nervous and active than those of Europe—but not necessarily more efficient. . . . They are alternately stimulated and relaxed by frequent

¹ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, ch. lv.

² See II. D (v), pp. 168–9, above.

changes from day to day, and in this are like horses that are well driven. In the spring and autumn, however, the combined effect of ideal temperature and highly invigorating daily changes spurs them to an astonishing degree of effort. Then comes the hot summer or the cold winter, either of which is debilitating. People do not diminish their activity at once, especially in the winter. They draw on their nervous energy, and thus exhaust themselves. They are like horses which pull on the bit and, when urged a little, break into a run, straining themselves by their extreme speed. Then they are pulled up so suddenly that they are thrown back on their haunches and injured. In Germany somewhat the same conditions prevail, although not to so great an extent. England apparently comes nearer to the ideal than almost any other place. The climate is stimulating at all times, both by reason of abundant storms and because of a moderate seasonal range. It never, however, reaches such extremes as to induce the nervous tension which prevails so largely in the United States.¹

Is this warning justified? When we are comparing the climatic influences of England and Holland and Hanover with those of New England and the Transvaal and Brandenburg, the question cannot be answered off-hand. The points on either side are so evenly matched that, when we try to strike a balance, it seems equally reasonable to pronounce, with Dr. Ellsworth Huntington, that England, after all, 'apparently comes nearer to the climatic ideal than any other place', or to make out that, on the whole, the more violent stimulus of New England is apt to evoke a more effective response. But suppose that we raise the violence of the stimulus to a still higher degree. Suppose that we substitute California on the Pacific coast of North America for New England on the Atlantic coast, and the African highlands of Kenya Colony on the Equator for the African highlands of the Transvaal on the Tropic of Capricorn, and the Polish or the Russian section of the North European plain for the Prussian section. Suppose that we make these substitutions, which all have the effect of heightening the violence of the stimulus, and then repeat our previous question in these alternative terms. On the whole and in the long run, does the climate evoke the more effective response in England or in California? In Holland or in Kenya Colony? In Berlin or in Warsaw or Moscow? When the question is framed in these alternative and sharper terms, the answer is not in doubt; for it is evident in every case that when the violence of the climatic stimulus is increased to that degree it brings in diminishing returns of human response.

As for California, Dr. Ellsworth Huntington's verdict in this case will be accepted without hesitation.

¹ Huntington, Ellsworth: *Civilisation and Climate*, 3rd ed. (New Haven 1924, Yale University Press), pp. 225-6. Compare pp. 403-4.

"The chief defect of the climate of the California coast is that it is too uniformly stimulating. Perhaps the constant activity which it incites may be a factor in causing nervous disorders. . . . The people of California may perhaps be likened to horses which are urged to the limit so that some of them become unduly tired and break down."¹

As for the Kenya highlands, we may take note of the widely different estimates that are current to-day among competent observers in regard to the prospects of the White Race in Kenya Colony and in the Transvaal respectively. To-day, no serious person doubts that the White Race has already proved its ability to make itself at home in the Transvaal and even to increase and multiply there. On the other hand, no serious person to-day is yet convinced that the White settlers in Kenya Colony will prove able to bring up their children in the country, or that a native-bred generation of Whites, even if it is actually reared in the Kenya highlands by a *tour de force*, will display the physical and psychic stamina of its European-bred parents.

As for the climatic stimulus of the North European plain, which rises in violence at each farther remove from the moderating influence of the Atlantic, it may be an open question whether it attains its optimum degree on this side or on that side of the Elbe. At any rate, that is a burning question of modern German politics—a perpetual source of friction between the Rhinelander or the Westphalian and the true-blue *ost-elbisch* Prussian; and, in this German family quarrel, a foreigner will be chary of taking sides. He will not readily commit himself on the question whether the *ost-elbisch* Prussian dominion over the western half of North Germany and the Prussian hegemony over Germany as a whole is or is not an inevitable political outcome of Prussian pre-eminence in vigour and efficiency. He will be content to agree that the optimum climatic area on the North European plain is to be found in the neighbourhood of the Elbe, on whichever side of the Elbe it may be. On the other hand, he will hardly hesitate to pronounce that this optimum climatic area, which begins at least as far west as the Elbe, does not extend as far east as the Vistula; for, whatever may be the respective merits of Hanoverian phlegm and Prussian alertness, 'the law of diminishing returns' quite manifestly comes into play where Prussian alertness froths over into Polish effervescence and Polish effervescence evaporates into Russian exaltation.

The successive rise and fall in the curve of the human response to a steadily rising climatic stimulus reveals itself to the eye of any traveller who passes by train through Hanover and Berlin and Posen and Warsaw *en route* for Moscow. From Berlin eastwards, the

¹ Huntington, *op. cit.*, p. 225.

curve unmistakably declines, and at each stage farther eastwards the decline becomes progressively steeper. If the traveller varies his route, and proceeds from Berlin east-north-eastward through Königsberg to Kovno, the same impression of a cultural fall succeeding a cultural rise in the course of his journey will be borne in upon him more forcibly; for, on this route, instead of feeling himself descending a cultural slope all the way, he will have at a certain point the sensation of falling headlong over a cultural precipice. At the frontier between East Prussia and Lithuania, as he is transported over the few yards of permanent way that link the German railway station of Eydtkühnen with the Lithuanian station of Wirballen, he will experience instantaneously as great a cultural transition as he would experience in the course of travelling the whole distance from Frankfurt-on-Oder to Brest-Litovsk. In the experience of the writer of this Study, this is the most precipitous cultural frontier that he has ever crossed—not excepting the passage of the Save between Semlin and Belgrade or the passage of the Ohio between Cincinnati and Kentucky.

Up to this point in our examination of the comparative effects of challenges from the physical environment which differ in the degree of their severity, we have been considering situations in which a challenge is presented in different degrees simultaneously in two or more separate geographical areas. Let us next consider the case in which the challenge rises or falls from one degree to another, through some process of climatic or other environmental change, in one identic area successively.

Let us examine, for example, the tropical sylvan environment—occupying the northern part of Guatemala and the western part of Honduras—in which the Mayan Civilization once emerged. We have noticed that this low-lying tropical forest presents a much severer challenge than the adjacent highlands overlooking the Pacific Coast; and we have concluded that the Mayan Civilization emerged, as it did, in the forest and not on the highlands just because the greater severity of the sylvan challenge evoked a more vigorous and effective human response.¹ But suppose that, some time after the Mayas had responded to the challenge of the forest by transforming the forest into fields, the climate of Central America had undergone some change which accentuated the challenge presented by the local physical environment to Man. Suppose that there had been a considerable increase in humidity. Might not this have rendered the challenge of the tropical forest prohibitively severe, and at the same time have rendered the challenge of the highlands adequately stimulating? As a matter of fact, at the present day, the sites of the

¹ See II. C (ii) (b) 2, vol. i, p. 321, above.

Mayan cities lie derelict, untenanted by Man and overwhelmed by the resurgent forest,¹ while the highlands are the seat of the local variety—such as it is—of the Latin-American version of our own Civilization.² Is it not possible that this undoubted interchange of social roles between forest and highlands may be due to some climatic change in the sense which we have suggested? One of the foremost living climatologists has advocated this hypothesis persuasively.

'The most surprising thing about the Mayas is that they developed their high civilisation in what are now the hot, damp, malarial lowlands where agriculture is practically impossible. A hundred miles away, on the coasts of Yucatan or in the Guatemalan highlands, far more favourable conditions now prevail. There, agriculture is comparatively easy; the climate, while not bracing, is at least good for the torrid zone; and malarial fevers are rare. To-day, the main cities lie in these more favourable regions; the energetic part of the population is there, and the interior lowlands are hated and shunned by all except a degraded handful. In the past, the more favourable localities were occupied by people close akin to the Mayas, yet civilisation never rose to any great height. Ruins are found there, but they are as far behind those of the lowlands as the cities of Yucatan are to-day behind those of the United States.'³

In explanation of these peculiar conditions, several possibilities suggest themselves. First, we may suppose that the Mayas were the most remarkable people who ever lived. . . . A second possibility is that, in the time of the Mayas, tropical diseases were less harmful than at present. . . . It may be . . . that a fairly satisfactory explanation will be found if the two preceding possibilities are joined with a third, namely, a climatic change such that the dry conditions which prevail a little farther north prevailed in the Maya region when these people attained eminence. Such a shifting of zones would increase the length of the dry season which now comes in February and March. This would diminish the amount of vegetation and cause scrub to take the place of dense forest. Under such conditions, agriculture would become comparatively easy. Fevers would also greatly diminish, for in the drier parts of Yucatan they are to-day relatively mild; and the lowland plain would be the natural site of the chief development of civilisation, just as is the case in other countries.'⁴

The hypothesis expounded in the foregoing passage might be accepted in principle without our necessarily following Dr. Huntington in his estimate of the degree of the climatic change involved. If the climate of Mayaland at the time of the genesis of the Mayan Civilization really differed from the climate of the same area at the present day to the same extent and in the same sense as the present climate of Yucatan, then the fathers of the Mayan Civilization were

¹ See II. D (i), pp. 3-4, above.

² See II. D (ii), p. 35, above.

³ On this point, see the present Study, Part II. D (ii), p. 34, above, with the references there made to Dr. Ellsworth Huntington's works.—A.J.T.

⁴ Huntington, *op. cit.*, pp. 330-2.

not confronted with the sylvan challenge at all, and we should have to regard their achievement as a response to some other challenge which is now beyond our knowledge. It is not necessary, however, to press Dr. Huntington's hypothesis thus far. It seems more reasonable to suppose that the Mayan Civilization was actually evoked by the challenge of the tropical forest, as we have already seen reason to believe, and that this particular interplay of Challenge-and-Response does explain why the civilization emerged where it did instead of emerging either on the Yucatan Peninsula or in the highlands. At the same time, we may follow Dr. Huntington so far as to conjecture that, at the time when the challenge of the forest evoked the Mayan response, the challenge was presented in a degree of severity which was stimulating, and that the subsequent abandonment of the Mayan cities to the resurgent forest may have been due, at least in part, to some climatic change which accentuated the sylvan challenge to a degree of severity that was prohibitive.¹

Dr. Huntington's hypothesis may also have a bearing on the genesis of other 'unrelated' civilizations besides the Mayan. We have found reason for thinking that the Egyptian and Sumerian civilizations, for example, were generated in response to a climatic change which is supposed to have overtaken Afrasia after the passing of the 'Pluvial Age' (the Afrasian variant of the European 'Ice Age'). We have suggested that the fathers of these two civilizations performed their feat of mastering the valleys of the Lower Nile and the Lower Tigris and Euphrates in response to the challenge presented by the desiccation of the Afrasian Steppe. They took their plunge into the forbidding jungle-swamps because their former habitat in the neighbourhood was beginning to turn from a genial savannah into an inhospitable desert. The ordeal of transition to the difficult environment of the un-reclaimed river-valleys from the easy environment which the savannah had provided before desiccation set in was the dynamic event by which, in our view, the fluvial civilizations were brought to birth.² We may now observe that the wilderness of the river-valleys, formidable though it was at the time when the fathers of the fluvial civilizations came to grips with it, was nevertheless not quite so formidable then as it must have been in the preceding period.

If we are right in conjecturing that the desiccation of Afrasia in the 'post-pluvial' age was the challenge which impelled the fathers of

¹ For the extent to which it is possible to accept Dr. Ellsworth Huntington's explanation of the rise and fall of the Mayan Civilization in Northern Guatemala—and likewise his complementary explanation of the vicissitudes of the Syriac Civilization at Palmyra—see II. D (vii), Annex I, below. For alternative explanations of the abandonment of the Mayan cities of 'the Old Empire', see I. C (i) (b), vol. i, footnote 2 on p. 126, above.

² See II. C (ii) (b) 2, vol. i, pp. 304-6, above.

the fluvial civilizations to descend into the river-valleys out of their former habitat on the surrounding savannah, then, *ex hypothesi*, the new environment which they were entering must have been tending to become easier at the same moment, and for the same reason, that the old environment which they were abandoning was becoming more difficult. For the process of desiccation which Afrasia was undergoing in this 'post-pluvial' age was part and parcel of a widespread climatic change which was simultaneously melting the ice-cap in Europe, and therefore, *a fortiori*, it must have been at work ubiquitously throughout Afrasia itself—on the savannah and in the river-valleys alike. At the same time, this uniform physical change would evidently produce diverse and even contrary social consequences in these two different Afrasian environments. A process of desiccation which was actually making the Afrasian savannah less easily habitable than it had been during the preceding 'pluvial' age by reducing the local quantum of humidity from the optimum quantity to an insufficiency, must have been making it less difficult for Man to cope with the Nilotic and Euphratean jungle-swamps, which had previously been kept uninhabited by an excess of humidity. We know, from the sequel, that the ordeal to which the fathers of the Egyptian and the Sumeric Civilization exposed themselves, when they eventually plunged into the jungle-swamps under these changing conditions, administered a stimulus which evoked, in both instances, a brilliantly successful response. Must we not suppose that if, for some reason, they had been moved to attempt the conquest of these same jungle-swamps at an earlier time, before the pluvial conditions had begun to abate, the ordeal would have proved so inordinately severe that its effect, instead of being stimulating, would have been repressive? In that event, the Nilotic and Euphratean pioneers, instead of being rewarded for their hardihood by becoming the fathers of two great civilizations, might have been punished for their audacity by becoming the slaves of their new environment and not its masters: the fate which has actually overtaken the miserable 'Web-Foot' in a subsequently deposited section of the Tigris-Euphrates delta.¹

If the foregoing argument is sound, we have reached the conclusion that the physical challenge by which the Egyptian and Sumeric civilizations were evoked was a mean between two extremes. On the one hand, the conditions of life on the Afrasian savannah in the pluvial age were not sufficiently severe to bring any civilizations to birth; on the other hand, the severity of the conditions in the lower valleys of the Nile and the Euphrates in the pluvial age was excessive. The necessary conditions of 'mean' or

¹ See II. C (ii) (b) 2, vol. i, pp. 316-18, above.

'optimum' severity were realized in the Afrasian region for the first time when the post-pluvial climatic change from exuberant humidity towards desiccation came to mitigate the previously excessive challenge of the river valleys to a degree at which it ceased to be impossible for Man to respond with success. It was in these circumstances that the Egyptian and Sumerian civilizations were born.

The same conclusion applies to the physical challenge by which our own Western Civilization and the Russian offshoot of the Orthodox Christian Civilization have been evoked in a different environment at a later date. The physical environment in which these two civilizations have eventually come to birth is Northern Europe; and during the pluvial-glacial age, when the Nilotic and Euphratean jungle-swamps were prohibitively water-logged, the birth of any civilizations in Northern Europe was prohibited, just as decisively, by the incubus of the ice-cap. The ice-cap then still covered with its dead weight the whole region which in this present post-glacial age has been conquered successively from the ice by the forest and from the forest by Mankind. Let us now ask ourselves what would have happened if the fathers of our Western Civilization and the fathers of the Russian Orthodox Christian Civilization had been moved for some reason to attempt the conquest of Northern Europe before the ice-cap had receded. The answer undoubtedly is that in that event, instead of becoming the fathers of two great civilizations, they would have suffered the same kind of fate as we have imagined the fathers of the Egyptian and the Sumerian Civilization suffering in punishment for a premature attempt to conquer the Nilotic and Euphratean jungle-swamps. If importunate pluvial pioneers would have been punished by being depressed to the social level of the modern 'Web-Foot' in the Basra-'Amārah-Nāsiriyyah triangle, importunate glacial pioneers would probably have been punished in a corresponding way by being depressed to the social level of the modern Lapps on the frozen tundras.¹

If this analogy holds, then the physical challenge which has helped to evoke the Western Civilization in Northern Europe and the Orthodox Christian Civilization in Russia is likewise to be viewed as a fruitful mean between two extremes which have both been sterile. In Northern Europe and Russia, as in the lower valleys of the Euphrates and the Nile, the severity of the conditions was excessive in the glacial-pluvial age, in common contrast to its insufficiency in the same age on the Afrasian savannah. In Northern Europe and Russia, the necessary conditions of 'mean' or 'optimum'

¹ See the quotation from Gibbon on p. 301, above.

severity were realized for the first time when the post-glacial climatic change melted the ice-cap and conjured up the North European forest in its place. It is under these new conditions of 'mean' severity that a region which was formerly inimical to Life has given hospitality to two great civilizations in the fullness of Time.

Scotland—Ulster—Appalachia

Let us next consider an instance in which the challenge has been not exclusively physical but partly physical and partly human.

At the present day, there is a notorious contrast between Ulster and the rest of Ireland. While Southern Ireland is a rather old-fashioned agricultural country, Ulster is one of the busiest workshops in the modern Western World. The city of Belfast ranks in the same company as Glasgow or Newcastle or Hamburg or Detroit; and the modern Ulsterman has as great a reputation for being efficient as he has for being unaccommodating.

In response to what challenge has the Ulsterman made himself what he now is? He has responded to the dual challenge of migrating to Ulster across the sea from Scotland and contending, after his arrival in Ulster, with the native Irish inhabitants whom he found in possession and proceeded to dispossess. This twofold ordeal has had a stimulating effect which may be measured by comparing the power and wealth of Ulster at the present day with the relatively modest circumstances of those districts on the Scottish side of the border between Scotland and England and along the Lowland fringe of 'the Highland Line' from which the original Scottish settlers in Ulster were recruited some three centuries ago by King James I/VI. The comparison reveals that, in the course of the intervening centuries, the dual challenge presented by Ulster has administered a noteworthy stimulus to those descendants of the original Scottish settlers who have remained on the Irish soil on which King James once planted their ancestors.

The modern Ulstermen, however, are not the only living representatives of this stock; for the migratory habit, once acquired, is apt to persist; and the Scottish pioneers who migrated to Ulster in the seventeenth century begot 'Scotch-Irish' children and grandchildren who re-emigrated in the eighteenth century from Ulster to North America. At the present day, the twice-transplanted offspring of these 'Scotch-Irish' emigrants to the New World survive, far away from their kinsmen in Ireland and their kinsmen in Scotland, in the fastnesses of the Appalachian Mountains: a highland zone which runs through half a dozen states of the North American Union from Pennsylvania to Georgia.

What has been the effect of this second transplantation upon the

Scotch-Irish stock? In the seventeenth century King James's colonists crossed the sea from Scotland to Ulster and took to fighting 'the Wild Irish' instead of 'the Wild Highlanders'. In the eighteenth century, their grandchildren crossed the sea again to become 'Indian fighters' in the North American backwoods. Obviously this American challenge has been more formidable than the Irish challenge, and this in both its aspects. In the human sphere, the 'Red Indian' heathen was of course a more savage adversary than the 'Wild Irish' Catholic (however wilfully the difference may have been ignored by the Scotch-Irish frontiersman in his Protestant fanaticism).¹ In the physical sphere, the Appalachian Mountains are wilder in scenery and vaster in scale than any landscape in Scotland or in Ulster, with the consequence that the Scotch-Irish immigrants who have forced their way into these natural fastnesses have come to be isolated and segregated here from the rest of the World to a much greater extent than their ancestors ever were, or than their cousins ever have been, in their Irish and Scottish habitats. In terms of the total environment, the severity of the challenge has been enhanced in the transition from Ulster to Appalachia to such a degree that 'the law of diminishing returns' has come into operation with unmistakable force.

If the modern citizen of industrial Belfast has in some respects outstripped his Scottish cousin who has never migrated from the rural neighbourhoods of 'the Highland Line' and the English Border, he has certainly not been outstripped in his turn by his American cousin who has migrated for the second time from Ulster to the Appalachian fastnesses. On the contrary, the stimulus which was once administered by the migration from Scotland to Ireland, so far from being reinforced by the subsequent migration from Ireland to America, has been more than counteracted—as we shall find if we now compare the Ulsterman and the Appalachian as they each are to-day, some two centuries since the date when they parted company.

Let us compare them, for example, on the point of their respective proneness to bloodshed: a point on which Ulster has by no means a good record. The old war to the knife between intrusive Protestants and indigenous Catholics is still carried on by gunmen from the windows of Belfast; and at this day the toll of political murders is heavier in the capital of Ulster than in any other great city of Western Europe.² Yet even in Ulster, where this political bloodshed still persists, there is no longer any survival of the family

¹ See II. C (ii) (a) 1, Annex, vol. i, pp. 465-7, above.

² These lines were written before the National-Socialist Revolution in Germany at the beginning of the year 1933.

blood-feud which has remained one of the regular social institutions of 'the Mountain People' of Appalachia. The Ulsterman, again, is unlikely to forget the sea, considering that one of his principal industries is shipbuilding, whereas the Appalachian, whose ancestors actually crossed the Atlantic five or six generations ago, has lost touch with the sea so completely that he no longer attaches any clear meaning to the word itself—which is preserved in his vocabulary solely through its occurrence in his folk-songs. In the third place, the Ulsterman has retained the traditional Protestant standard of education, whereas the Appalachian has relapsed into illiteracy and into all the superstitions for which illiteracy opens the door. His agricultural calendar is governed by the phases of the Moon; his personal life is darkened by the fear, and by the practice, of witchcraft. He lives in poverty and squalor and ill-health. In particular, he is a victim of Hook-Worm: a scourge which lowers the general level of vitality in Appalachia just as it does in India and for just the same reason. (The children persist in going about bare-foot, and their parents either cannot afford to give them shoes, or will not take the trouble to insist upon their wearing them, or are too ignorant to be aware that Hook-Worm gains entry into human bodies through sores in naked soles.)

In fact, the Appalachian 'Mountain People' at this day are no better than barbarians. They are the American counterparts of the latter-day White barbarians of the Old World: the Rifis and Kabyles and Tuareg, the Albanians and Caucasians, the Kurds and the Pathans and the Hairy Ainu.¹ These White barbarians of America, however, differ in one respect from those of Europe and Asia. The latter are simply the rare and belated survivals of an ancient barbarism which has now passed away all around them; and it is evident that their days, too, are numbered. Through one or other of several alternative processes—extermination or subjection or assimilation²—these last lingering survivals will assuredly disappear within the next few generations, as other survivals of White barbarism have disappeared in other parts of the Old World at earlier dates: in the Scottish Highlands in the eighteenth century³ and in Lithuania in the fourteenth.⁴ It is possible, of course, that barbarism will disappear in Appalachia likewise. Indeed, the process of assimilation is already at work among a considerable number of Appalachians who have descended from their mountains and changed their way of life in order to earn wages in the North Carolinian cotton-mills. In this case, however, there is no

¹ See II. C (ii) (a) 1, vol. i, p. 236, above.

² For these processes, see further V. C (i) (c) 2 and 3, *passim*, in vol. v, as well as Part VIII, below.

³ See II. C (ii) (a) 1, vol. i, p. 237, above. ⁴ See II. D (v), pp. 172-4, above.

corresponding assurance; for the White barbarism of the New World differs from that of the Old World in being not a survival but a reversion.

The 'Mountain People' of Appalachia are *ci-devant* heirs of the Western Civilization who have relapsed into barbarism under the depressing effect of a challenge which has been inordinately severe; and their neo-barbarism is derived from two sources. In part, they have taken the impress of the local Red Indians whom they have exterminated.¹ Indeed, this impress of Red Indian savagery upon the White victors in this grim frontier-warfare is the only social trace that has been left behind by these vanquished and vanished Redskins. For the rest, the neo-barbarism of Appalachia may be traced back to a ruthless tradition of frontier-warfare along the border between Western Christendom and 'the Celtic Fringe' which had never died out among their ancestors in the British Isles and which has been revived, among these Scotch-Irish settlers in North America, by the barbarizing severity of their Appalachian environment.² On the whole, the nearest social analogues of the Appalachian 'Mountain People' of the present day are certain 'fossils' of extinct civilizations which have survived in fastnesses and have likewise relapsed into barbarism there: such 'fossils' as the Jewish 'wild highlanders' of Abyssinia and the Caucasus or the Nestorian 'wild highlanders' of Hakkari.³

It will be seen that industrial Ulster is a social 'optimum' between rural Scotland on the one hand and barbarian Appalachia on the other; and that this 'optimum' is the product of a response to a challenge which, in point of severity, presents itself as a 'mean' between two extremes. The challenge to which King James's colonists were exposed in Ulster was distinctly more severe than the challenge that had been faced by their ancestors along the English Border or 'the Highland Line'. On the other hand, it was very much less severe than the challenge which afterwards presented itself to their Scotch-Irish descendants when these migrated from Ulster to North America in order to become 'Indian-fighters' in the Appalachian hills. The contrast between rural Scotland and industrial Ulster bears out, as far as it goes, the law of 'the greater the

¹ 'The wilderness masters the colonist. It finds him a European in dress, industries, tools, modes of travel, and thought. It takes him from the railroad car and puts him in the birch canoe. It strips off the garments of civilization and arrays him in the hunting shirt and the moccasin. It puts him in the log cabin of the Cherokee and Iroquois and runs an Indian palisade around him. Before long he has gone to planting Indian corn and plowing with a sharp stick; he shouts the war-cry and takes the scalp in orthodox Indian fashion. In short, at the frontier the environment is at first too strong for the man.' (Turner, F. J.: *The Frontier in American History* (New York 1921, Holt), p. 4.)

² See II. C (ii) (a) 1, Annex, vol. i, on pp. 465-7, above.

³ See II. D (vi), pp. 256-9, above, and the Annex dealing with Jews in fastnesses, on pp. 402-12, below.

challenge the greater the response'; but in the sharper contrast between industrial Ulster and barbarian Appalachia we see this particular law overridden by the general 'law of diminishing returns': a law which, in any situation, infallibly comes into operation at some point or other when things are pushed to extremes.

In this sequence 'Scotland—Ulster—Appalachia', the challenge is on the borderline between the physical sphere and the human; but the operation of 'the law of diminishing returns' appears quite as clearly in other instances in which the challenge is presented in the human sphere exclusively.

Reactions to the Ravages of War

Let us reconsider, for example, the effects of the challenge of devastation. We have observed above¹ how the Athenians responded to the devastation of Attica at Persian hands in 480–479 B.C. and the French to the devastation of France at German hands in A.D. 1914–18. We have seen that, in both these instances, a great calamity has acted as a potent stimulus; and we have also seen that, in one instance at least, this stimulus has been worth the price, when we have compared the achievements of the Athenians in the post-war period with those of the Thebans. Thebes escaped devastation—and thereby missed the stimulus of devastation—in the Persian War; and in the sequel Thebes was outstripped by her neighbour who had come out of great tribulation. Thus the contrast between the fortunes of Athens and Thebes in this historic case bears out the law of 'the greater the challenge the greater the response'; but again it only bears it out so far as it goes. Let us now add a third term to this series and compare the sequels to the devastation of Attica in 480–479 B.C. and of France in A.D. 1914–18 with the sequel to the devastation of Italy by Hannibal in 218–201 B.C. Hannibal succeeded in inflicting deeper wounds on Italy than the Persians inflicted on Attica or the Germans on France. Did this greater calamity act as a stimulus likewise? And, if it did, was the potency of the stimulus proportionately higher? The answer to both parts of this question is decidedly in the negative. The devastation of Italy, unlike that of France or Attica, did not turn out to have been a blessing in disguise. On the contrary, the devastated area in the South became the seat of a social cancer which ate into the vitals of the Roman Commonwealth until the whole fabric of Roman economic and political life was destroyed. In post-war Roman Italy, there was no genuine parallel to the renovation of agriculture in post-war Attica and of industry in post-war France. In Italy the devastation administered an economic stimulus which proved transitory and

¹ See II. D (iv), pp. 107–11, above.

evoked a social response which proved all too difficult to revoke after its ill effects had become apparent.

What happened is well known. The devastated arable lands of Southern Italy were transformed partly into pasture-lands and partly into vineyards and olive orchards, according to the local degree of the devastation and the local nature of the terrain; and the new rural economy, planting and stock-breeding alike, was worked by slave-labour, in place of the free peasantry which had once tilled this soil before Hannibal's soldiery burnt the peasant's cottage and before the weeds and briars invaded his deserted fields. This revolutionary change from 'subsistence-farming' to 'cash-crop-farming' and from husbandry to the application of a servile 'man-power' undoubtedly increased for a time the monetary value of the produce of the land; but the social value of this temporary increase in the aggregate amount of the national income was offset by a concurrent increase in the inequality of its distribution and was more than counteracted by the attendant social evils: the depopulation of the country-side and the congregation of a pauper proletariat of *ci-devant* peasants in the towns. The attempt to arrest these evils through legislation, which was made by the Gracchi in the third generation after Hannibal's evacuation of Italy, only aggravated the distemper of the Roman Commonwealth by precipitating a political revolution without bringing the economic revolution to a halt; political strife became inflamed into civil war; and, a century after the tribunate of Tiberius Gracchus, the Romans acquiesced in the establishment of a permanent dictatorship by Augustus as a drastic remedy for a desperate state of affairs. Thus the devastation of Italy by Hannibal, so far from stimulating the Roman people as Xerxes' devastation of Attica had once stimulated the Athenians, actually gave them a shock from which they never recovered: a shock which revealed its demoralizing and debilitating effects in the political collapse of the Roman Republic and in the economic decay of Roman Italy and ultimately in the decline and fall of the Roman Empire.

In this sequence, again, we see the law of 'the greater the challenge the greater the response' first of all borne out and then overridden. It is borne out in the contrast between the fortunes of Athens and the fortunes of Thebes in and after the War of 480-479 B.C. It is overridden by 'the law of diminishing returns' in the contrast between the fortunes of Athens in and after that war, when Xerxes had chastised her with whips, and the fortunes of Rome in and after the War of 218-201 B.C., when Hannibal had chastised Rome with scorpions. The chastisement of devastation, which is stimulating when it is administered with Persian vigour, becomes deadly when it is inflicted with Punic intensity.

Chinese Reactions to the Challenge of Emigration

Let us reconsider, again, the effects of the challenge of emigration upon the modern Chinese. We have seen above¹ that when the Chinese coolie emigrates to Malaya or Indonesia, he is apt to reap a reward for his enterprise. By facing the social ordeal of leaving his familiar home and entering an alien social environment, he exchanges an economic environment which is congested and poverty-stricken for one in which he has a chance of bettering himself, and not infrequently he profits by this chance to the extent of making his fortune. Suppose, however, that we intensify the social ordeal which is the price of economic opportunity. Suppose that, instead of sending our Chinese emigrant to Malaya or Indonesia we send him to Australia or California. In these 'White Man's countries' our enterprising coolie, if he gains admission at all, will undergo an ordeal of vastly greater severity. Instead of merely finding himself a stranger in a strange land, he will have to endure deliberate and sometimes malignant penalization, in which the Law itself will discriminate against him instead of coming to his aid as it aids him in British Malaya, where an official 'Protector of Chinese' is appointed by a benevolent Colonial Administration. Does this severer social ordeal evoke an economic response of proportionately greater vigour? This question is answered in the negative when we compare the levels of prosperity which are in fact attained by the Chinese 'Diaspora' in California and Australia with the levels attained in the Philippines and Malaya. The comparison shows conclusively that the social ordeal to which the Chinese are everywhere subject abroad brings in diminishing returns when it is intensified from the Malayan to the Australian or from the Philippine to the Californian degree.

Slavs—Achaean—Teutons—Celts

Let us next reconsider the challenge which a civilization presents to a barbarism: a challenge that has been presented in Europe to successive layers of barbarians, in successive ages, by the radiation of various civilizations into the interior of this once dark continent.

When we study this drama in its European setting, our attention is caught by one instance in which the challenge has evoked a response of extraordinary brilliance. The Hellenic Civilization is perhaps the finest flower of the species that has ever yet come to bloom; and this Hellenic Civilization was generated, in response to a challenge from the Minoan Civilization, by the European Barbarism. When the maritime Minoan Civilization which had arisen in the Aegean Archipelago established a footing on the European

¹ In II. D (vi), on pp. 217-18.

continent, along the seaboard of the Greek Peninsula, the Achæan barbarians of the European hinterland were neither exterminated nor subjected nor assimilated. Instead, they managed to retain their identity as an 'external proletariat' of the Minoan 'thalassocracy' without failing to learn the arts of the civilization which they were holding at bay. In due course, these *ci-devant* continental barbarians took to the sea. Eventually they overcame the Cretan 'thalassocrats' on their own element.¹ And the Achæans were the true fathers of the Hellenic Civilization which emerged, in its turn, in the Aegean area after the Minoan Civilization had been swamped by the Achæan *Völkerwanderung*.

The Achæan claim to the paternity of Hellenism is vindicated, as we have seen, by a religious test; for the Gods of the Olympian Pantheon, who were the paramount and universal objects of Hellenic worship, display manifestly in their lineaments their derivation from these Achæan barbarians who had constituted the 'external proletariat' of the Minoan World,² while any vestiges of a universal church derived from the Minoan 'internal proletariat' are only to be found, if at all, in the side-chapels and the crypts of the temple of Hellenic religion: in certain local cults and subterranean mysteries and esoteric creeds.³ This reaction of the Hellenic Society to the religious test is strikingly different from the reaction of our own Western Society, in which a universal church derived from the 'internal proletariat' of an antecedent civilization has served as the chrysalis of the new civilization and has never ceased to be its most important institution. On the other hand, in the religious history of Western Christendom, the religion of the antecedent civilization's European 'external proletariat'—the primitive Teutonic heathenism and the Arianism by which this heathenism was superseded on the eve of the Teutonic *Völkerwanderung*—has left even less trace than has been left by the religion of the Minoan 'internal proletariat' in the religious history of Hellenism. These diverse results of the religious test plainly give us warrant for ascribing the paternity of the Hellenic Civilization to the Achæans, and for seeing in this great feat of creation the response of these European barbarians to a challenge which the radiation of the Minoan Civilization had presented to them.

The measure of the stimulus in this instance is given by the brilliance of Hellenism, which still outshines every other civilization that has ever come into existence up to the present. And we can also measure the stimulus which was received from the Minoan Civilization by the Achæans in another way. We can make a direct

¹ See I. C. (i) (b), vol. i, pp. 92-3, and II. D (v), p. 160, above.

² See I. C. (i) (b), vol. i, pp. 95-7, above.

³ See I. C. (i) (b), vol. i, pp. 97-100, above.

comparison between the fortunes of this Achaean layer of European barbarians and the fortunes of another layer which happened to be so remote and so effectively sheltered that it remained virtually immune from the radiation of any civilization whatsoever for some two thousand years after the Achaeans had received the Minoan challenge and had made their brilliant response. These inviolate barbarians were the Slavs, who had ensconced themselves in the Pripet Marshes when these dregs of the Continent had been yielded up to Man by the retreating ice-cap. In this fenny fastness, which offered little temptation to trespassers, the Slavs went on living the primitive life of the European Barbarism for century after century, while the history of the Hellenic Civilization, which had been begotten by their Achaean kinsmen, played itself out from start to finish. When the wheel of Hellenic destiny came round full circle, and the Teutonic *Völkerwanderung* ended the long drama which the Achaean *Völkerwanderung* had begun, the sluggish Slavs were still where they had been and what they had been some two thousand years earlier.

It was only when the Teutonic *Völkerwanderung* itself was approaching the end of its course that the Slavs were at last routed out of their ancient fastness by the Avar Nomads, who had been tempted to stray beyond the limits of their native Eurasian Steppe in order to take a hand in the Teutons' game of pillaging the wreckage of the Roman Empire. In the strange environment of an agricultural world, these lost children of the Steppe sought to adapt their old manner of life to their new circumstances. On the Steppe, the Avars had made their living as herdsmen of cattle; in the cultivated lands on to which they had now trespassed, these herdsmen found that the appropriate local live-stock was a human peasantry, and they therefore set themselves, rationally enough, to become herdsmen of human beings.¹ Just as they would have raided their Nomadic neighbours' cattle in order to stock some newly conquered pasture-land, so they now looked round for human cattle to re-stock the depopulated and derelict provinces of the Roman Empire which had fallen into their hands. Ranging the interior of the European Continent on this quest, the Avars found

¹ In sedentary societies, it is often cast up as a reproach against Nomads who have strayed off the Steppe *in partes agrorum* that they tend to treat their sedentary subjects as 'human cattle'. Yet a sedentary and not a Nomadic society created the religion which conceives of its Lord as 'the Good Shepherd', and which represents him as enlisting fishermen in his service with the invitation 'Follow me, and I will make you fishers of men' (Matt. iv. 19). The metaphor of the shepherd (*ra'i*) and his flock (*ra'iyyah*) was no doubt derived by the Christian Church, at second or third remove, from the Nomads of the Afrikan Steppe, and it ill becomes us to foul our own nest by blaspheming against the source of one of the most pregnant similes in the imagery of the Christian Religion. For a critique of Nomadism, on and off the Steppes, as one of the 'arrested' civilizations, see Part III. A, vol. iii, pp. 7-22, below.

what they wanted in the Slavs. They forced their way into the Slavonic fastness; they herded off its helpless denizens in droves; and they stationed these captive droves of Slavonic human cattle in a vast circle round about the outlying enclave of the Eurasian Steppe in the Hungarian Alföld where the Avars had pitched their own camp. This, it appears, was the process by which the Slavs made their belated and humiliating début in History;¹ and the last of the Hellenic historians has been moved by a faint stirring of the old Herodotean curiosity to record the impression which was made on the senile Hellenic mind, towards the latter end of the sixth century of the Christian Era, by the first appearance of these Slavonic innocents abroad, when they came wandering all unarmed, out of the back of beyond, across the stricken field of the secular conflict between Teutons and Romans. Here is the passage in the annals of A.D. 591:²

'Three men of Slav race without weapons or military equipment were captured by the Imperial Body-Guard. Their only baggage consisted of harps, and they carried nothing else with them. The Emperor cross-examined them regarding their nationality, their habitat, and their reasons for trespassing upon Roman territory. They explained that they were Slavs by nationality and that their homes were on the boundary of the Western Ocean. The Khaqan [of the Avars] had sent emissaries to their countrymen with a view to raising military forces and had lavished generous presents upon their chieftains. The latter had accepted the gifts but rejected the proposed alliance, on the plea of being disheartened by the length of the journey, but they had followed this up by dispatching the individuals just captured to the Khaqan on a mission of apology. It had taken them fifteen months to accomplish this journey. Forgetful of the privileges of ambassadors, the Khaqan had determined to prevent their departure; whereupon the three emissaries, who had heard of the really extraordinary reputation of the Roman People for wealth and hospitality, had procured an opportunity to withdraw to Thrace. They carried harps because they were not trained to bear arms. Their country was ignorant of iron, and this accounted for their peaceful and harmonious life. They strummed on stringed instruments because they did not know how to speak with the voice of trumpets. They were people among whom war was unheard-of; and it was only natural that there should be a bucolic note in their musical technique.

'This story inspired the Emperor with such respect for the tribe that he determined to offer hospitality to these visitors from the back of beyond, whose gigantic build and huge limbs extorted his admiration. He sent them under escort to Heraclea.'

These amiable but unpractical representatives of the European

¹ See Peisker, J.: *Die älteren Beziehungen der Slawen zu Turko-Tataren und Germanen* (Berlin 1905, Kohlhammer); and *The Expansion of the Slavs* = *Cambridge Medieval History*, vol. II (Cambridge 1913, University Press), ch. xiv.

² Theophylactus Simocatta: *A Universal History*, Bk. VI, section II, §§ 10-16.

Barbarism in its most secluded fastness were obviously the worse for the age-long immunity from human stimulus which they and their ancestors had enjoyed. It was assuredly better for them when, a few years later, the Khaqan of the Avars—losing patience with their lack of spirit—turned from blandishments to violence and dragged the Slavs out of their seclusion by main force. The shock administered by this Avar *coup de main* was the making of the Slavs and the beginning of Slavonic history. It would have been better still for these victims of Avar ruthlessness if they had been aroused by some less brutal human stimulus at an earlier date, as once, some two thousand years before, the radiation of the Minoan Civilization had awakened a response in the Achaeans. The Achaeans did not lack skill with the harp. Indeed, there is no Slavonic minstrel, historic or legendary, who has won the fame of a Phemius or a Demodocus or a Homer. But Achaean hands had not neglected other arts. In their intercourse with the Minoans, the Achaeans had made themselves masters not only of the harp but of the sword and of the oar, and thereby masters of their environment and their fate. This contrast between the Achaeans and the Slavs shows two things. It shows that, for a primitive society, complete immunity from the challenge of encounters with civilizations is a very serious handicap. It also shows that this challenge has a stimulating effect when its severity is of a certain degree. There is a third point, however, which we still have to determine. Suppose that we accentuate the challenge; suppose that we raise the degree of the energy with which the Minoan Civilization irradiated the Achaean Barbarism to higher and higher potencies: shall we thereby elicit a more and more brilliant response on the barbarians' part? Or shall we reach a degree at which 'the law of diminishing returns' comes into play and the potency of the action ceases to be stimulating and becomes destructive? Let us make the experiment by applying our empirical method of inquiry. Between the Achaeans and the Slavs, there have lain several other layers of European barbarians who have been exposed to the radiation of various civilizations in diverse degrees. What experiences have these other barbarians had?

One instance in which European barbarians have succumbed to a radiation of destructive intensity has come to our notice already. We have seen how the Celts were eventually exterminated or subjected or assimilated by an overpowering radiation of Hellenism in a Roman medium, after a transitory outburst of Celtic energy in response to an earlier stimulus which the Celts had received from Hellenism through the medium of the Etruscans.¹ We have

¹ See the present chapter, pp. 279-82, above.

contrasted the ultimate failure of the Celts with the relative success of the Teutons in holding their own against the Hellenic impact. We have noted that the Teutonic layer of European barbarians, unlike the Celtic layer, resisted the disintegrating action of Hellenism to such effect that the Teutons were able to take their place in the 'external proletariat' of the Hellenic World and to dispatch the Hellenic Society in its death-agonies with a *coup de grâce*. By comparison with the Celtic *débâcle*, this Teutonic reaction to Hellenism was a success; but as soon as we compare the Teutonic achievement with the Achaean, we are reminded that the Teutons gained nothing better than a Pyrrhic victory.¹

The Teutons came in at the death of the Hellenic Civilization only to receive their own death-blow, on the spot, from the rival proletarian heirs of the defunct society. The victor on this field was not the Teutonic war-band but the Roman Catholic Church into which the 'internal proletariat' of the Hellenic Society had incorporated itself; and this victory of the Church over the barbarians was complete before the end of the social interregnum which the break-up of the Roman Empire had brought with it. Before the close of the seventh century of the Christian Era, every one of those Arian or heathen Teutonic war-bands that had ventured to trespass on Roman ground had been either converted to Catholicism or wiped out of existence; and, as converts to Catholicism, the surviving barbarian intruders renounced the pretension to bequeath to the future any positive contribution of their own except a racial strain of uncertain social value. The new civilization, 'affiliated' to the Hellenic Civilization, which emerged in the West when the post-Hellenic interregnum came to an end, was related to the antecedent civilization through the 'internal proletariat' and not through the 'external proletariat'. Western Christendom was essentially the creation of the Catholic Church—in contrast to Hellenism, which was essentially the creation of the Achaean barbarians. Thus the Teutons showed themselves unequal to the situation at the crucial point at which their Achaean counterparts had consummated their own brilliant achievement. The Teutons made the great refusal which Esau made when he sold his birthright to Jacob.² They had

¹ See I. C (i) (a), vol. i, pp. 58-62, above.

² For the replacement of pagan by Christian themes in the English version of the Teutonic Epic, see I. C (iii) (e), Annex, vol. i, p. 449, footnote 2, above. This compromise, however, did not save the Teutonic Epic from a premature death; for the abandonment of the pagan poetic themes was soon followed by an abandonment of the pagan poetic forms as well. For a striking account of the Teutons' repudiation of their own heritage in the domain of literature, see Ker, W. P.: *Epic and Romance* (London 1922, Macmillan), pp. 45-7. 'In mediaeval literature, whatever there is of the Homeric kind has an utterly different relation to popular standards of appreciation from that of the Homeric poems in Greece. . . . English epic is not first, but one of the least, among the intellectual and literary interests of King Alfred.'

not the spirit to compete with the Catholic Church for the paternity of a new civilization.

Let us now arrange our series of the challenges delivered by various civilizations to successive layers of the European Barbarism in the order of an ascending scale of severity. The Slavs were long immune from the challenge altogether and were patently the worse for being without the stimulus. The Achaeans were presented with the challenge of the Minoan Civilization and made the brilliant response of becoming the fathers of Hellenism. The Teutons held their own against the challenge of the Hellenic Civilization but were discomfited thereafter by the challenge of Catholicism: a universal church which first took shape as an embodiment of the Hellenic 'internal proletariat' and which eventually made itself into the chrysalis of a new civilization—the Western Christendom into which the progeny of the Teutonic war-bands was incorporated. The Celts were discomfited by the antecedent challenge of the Hellenic Civilization, against which the Teutons managed to hold their own. It is evident that the radiation from the Minoan Civilization to which the Achaeans were exposed was of the 'optimum' degree, and that this degree represents a mean between the insipid immunity of the Slavs and the overwhelming bombardment of Hellenic radiation to which the Celts succumbed. It is further evident that 'the law of diminishing returns' comes into operation, in this particular field of Challenge-and-Response, when the severity of the challenge is raised to some point between the degree at which the challenge of the Minoan Civilization stimulated the Achaeans and the higher degree at which the challenge of the Catholic Church proved too much for the Teutons.

Does our empirical method enable us to define more closely this point at which 'the law of diminishing returns' is here brought into play? Yes, it does; for the encounter in which the Teutonic trespassers on Roman ground succumbed to the Catholic Church was not the only conflict in which the Church was compelled to engage with European barbarians. Before it succeeded in bringing our Western Civilization to birth and ensuring that the child should live, the Church had to fight for her own life against two separate rear-guards of the 'external proletariat' of the Hellenic World which had not been drawn into the post-Hellenic *Völkerwanderung* when the Teutonic advance-guard swept over the derelict provinces of the Roman Empire *circa* A.D. 375–675. These two rear-guards were the Celts of 'the Celtic Fringe' that had remained beyond the range of effective Roman rule in the British Isles, and the Teutons of Scandinavia: a region which had lain beyond the zone of Roman border warfare on the European Continent. It was these Far Western Celts

and Far Northern Teutons who proved themselves the Church's most formidable adversaries. The reckless Teutonic advance-guard, exposing itself all unprepared to the Church's counter-attack on a battle-field ill suited to barbarian weapons and barbarian tactics, was defeated by the Church without much difficulty. The prudent Celtic and Teutonic rear-guards of the European Barbarism held themselves in reserve and sought to beget new civilizations of their own in place of Hellenism, as Hellenism itself had once been begotten, in place of the antecedent Minoan Civilization, by the barbarian Achaeans. These high ambitions brought first the Far Western Celts and then the Far Northern Teutons into conflict with the Catholic Church, since in Western Europe there was not room for several separate civilizations—all related to Hellenism in different fashions and degrees—to grow up side by side simultaneously. In both these conflicts the Church eventually won the day and the ambitious barbarians were forced, after a hard struggle, to accept defeat. Yet these Celts and these Teutons of the rear-guard, unlike their Teutonic kinsmen who perished before them in the van, came very near to achieving the same success as their Achaean predecessors. They both did succeed in begetting new civilizations before they severally succumbed; and though these two embryonic civilizations were abortive, they did not pass into limbo before they had each taken a recognizable shape which can be given a name. We may call them the abortive Far Western Christian Civilization and the abortive Scandinavian Civilization. Let us take a glance at each of them.

The Abortive Far Western Christian Civilization

The distinctive feature of the Far Western Christian Civilization of 'the Celtic Fringe' was its attitude towards Christianity. Unlike the Gothic converts to Arianism or the English converts to Catholicism, the Celtic barbarians who survived to accept Christianity did not take the alien religion as they happened to find it. They moulded it to fit their own barbarian social heritage, instead of allowing it to break up their native tradition and instal itself uncompromisingly in the vacuum. In modern scientific terms, the Christianization of the Celtic rear-guard was not revolutionary but evolutionary.

'No other race showed such originality in its way of taking Christianity. . . . The Church felt no obligation to be severe towards the caprices of the [Celtic] religious imagination; it gave free play to popular instinct; and the outcome was a cult which was perhaps the most thoroughly steeped in Mythology and the most closely analogous to the Mysteries of Hellenic Antiquity of any cult recorded in the annals of Christianity.'¹

¹ Renan, E.: *Essais de Morale et de Critique* (Paris 1859, Lévy), pp. 437-8 and 442, quoted by Gougoud, L., in *Les Chrétientés Celtiques* (Paris 1911, Gabalda), p. 58. In the

This originality showed itself even among the Celts of Britain, whose native genius had been subjected, under the Roman régime, to the standardizing impress of a latter-day cosmopolitan Hellenism. The relatively short span of perhaps not more than two centuries that intervened between the spread of Christianity through the Roman Island and the invasion of the English barbarians sufficed to produce, in Pelagius, a British 'heresiarch' who caused a stir throughout the Christian World of his day. The nascent Far Western Christendom, however, was to find its focus not in Roman Britain but in barbarian Ireland. Pelagius himself was possibly of Irish origin; but while Pelagius's work was ephemeral, both in Britain and on the Continent, the work of his British contemporary Patrick, who evangelized Ireland, was of enduring importance. If certain scholars are right in supposing that the historical home of this triumphant British apostle of Ireland lay in a neighbourhood that is the traditional home of the British hero King Arthur,¹ whose name is associated in legend with the leadership of a forlorn hope, the coincidence may be taken as symbolic. For virtue was going out of Britain into Ireland at the very time when the spear-head of the English Völkerwanderung was piercing Britain's opposite flank. In the course of the fifth and sixth centuries of the Christian Era, Ireland increased and Britain decreased until the centre of gravity of the insular Celtic World passed over decisively from the 'Roman' to the 'barbarian' island.

The English transmarine Völkerwanderung, which dealt the British Celts a crushing blow, made the Irish Celts' fortune. While the Britons bore the brunt of the English invasion, the Irish were not only immune from English attack themselves but actually emulated the English in harrying their unhappy British kinsmen. When the Roman defences of Britain broke down, the Irish raided the west coast of the derelict Roman insular dominion as the English were raiding the east coast; and it was as a captive, carried away on one of these Irish raids, that Patrick first set foot in Ireland. These

English translation of the last-mentioned work, which has been published by Dom L. Gougaud after an interval of twenty-one years under the title *Christianity in Celtic Lands* (London 1931, Sheed and Ward), the author criticizes, as overdrawn, the picture of Celtic idealism which is given by Renan in the essay entitled 'La Poésie des Races Celtiques', in which the above-quoted passage occurs. (See Gougaud: *Christianity in Celtic Lands*, p. 19.)

¹ On this location of the obscure Bannaventa, see Bury, J. B.: *The Life of Saint Patrick* (London 1905, Macmillan), pp. 17 and 322-5. The most convincing alternative location is Dumbarton on the Clyde; and this is preferred by Gougaud (see *Christianity in Celtic Lands*, p. 32) and by J. A. Duke (in *The Columban Church* (Oxford 1932, University Press), Appendix IV, pp. 145-50). But the thoroughly Roman touches in Patrick's own description of his family background make it difficult, *a priori*, to suppose that he can have been born and brought up in a district of North Britain which had only just been included within the frontiers of the Roman Empire, even at the time of the Empire's farthest extension in this quarter, and which had almost certainly been abandoned to barbarism again thereafter some time before the date of Patrick's birth.

fifth-century Irish raiders likewise emulated the English in making permanent settlements on British soil; and though these were not comparable with the English settlements in scale, one of them—planted by raiders from Dalriada, in the north-east corner of Ireland, on the opposite British coast, at the point where the intervening seas are narrowest—was destined to become the nucleus of one of the two enduring kingdoms into which the petty and ephemeral successor-states of the Roman Empire in Britain were eventually consolidated.¹ The most valuable boon, however, which the Irish obtained from the English *Völkerwanderung* into Britain was not this opportunity of taking a modest share of the British spoils. The main effect of the English *Völkerwanderung* upon Irish fortunes was to segregate Ireland—immediately after the seeds of Christianity had been sown there—from those *ci-devant* Roman territories in the western part of the European Continent in which a new Christian Civilization, oriented towards Rome, began to emerge during the post-Hellenic interregnum. It was this segregation, at the most formative stage of early growth, that made it possible for the embryo of a separate and distinctive 'Far Western Christian Civilization', with its nucleus in Ireland, to emerge simultaneously with the emergence of the nascent Continental Western Christendom.

'The Irish culture differed considerably from the general European-Roman Civilisation. . . . It is true, Christianity had penetrated to this westernmost land of Europe; but in countless other respects Ireland had remained outside the spread of civilisation, so that the peculiarly Celtic culture had had time to develop in its richest and most unique form. . . . Christianity had taken root very early and had produced small hermit-like monastic settlements which were the leading force in the Irish Church. They were in a sense the heirs of the struggle waged by the ancient Druids on evil spirits with the aid of conjuring, and were at the same time consecrated to an inner religious life and an external missionary activity. A curious adventurous asceticism drove hermit societies—twelve monks and an abbot, corresponding in number to the Redeemer and His disciples—to the outermost islands, in one case even to distant Iceland, before any other human foot had stepped upon the island.'²

The originality of the Far Western Christian Civilization, as it emerged in Ireland, is manifest alike in its ecclesiastical organization, in its ritual and hagiography, and in its literature and art.

In Ireland conspicuously, and to some extent also in Wales and in

¹ For the origin of this new Dalriada on British soil, see II. D (iii), p. 86, and II. D (v), p. 194, above. It is one of the well-known curiosities of history that the Scottish name, which originally belonged to the Irish Celts and was carried from the old to the new Dalriada by Irish settlers, should have lost its association with Ireland and have become exclusively associated with a kingdom that is situated in Britain and with a language that is not Celtic but Teutonic.

² Olrik, A.: *Viking Civilisation* (English translation: London 1930, Allen and Unwin), pp. 107-8.

Brittany, the life of the Celtic Church was 'cellular'—in the literal as well as the metaphorical sense. It resided in the monasteries, which were sometimes federated in clusters (*familiae*) round some mother-foundation—the most famous example being the *Familia Columbae* which clustered round Iona.¹ A monastic cell or cluster of this kind was apt to be established, as a nucleus of the embryonic civilization, in each of the cantons into which barbarian Ireland was politically articulated. The initiative seems usually to have been taken by the local chieftain; and the cells and clusters thus established were governed by abbots—sometimes spiritual, sometimes temporal—who in many places were required to be of the founder's kin. The Irish called their monasteries in Latin *civitates*—the Latin name for the city-states of the Hellenic World which had become bishops' sees after the advent of Christianity. The Irish *civitates* resembled their continental European namesakes in being the seats of bishops; but here the resemblance ceased; for the Irish *civitates* were monasteries and not towns;² the episcopal office in an Irish monastic *civitas* was sometimes held by the hereditary abbot himself³ and sometimes by a tame bishop living in the monastery under the abbot's control;⁴ and these Irish cloistral bishops had no mutually exclusive territorial jurisdictions. There were even bishops who had no connexion with a monastery and therefore no fixed point of residence or zone of jurisdiction at all. Conversely, there were non-episcopal monasteries which were independent, *de facto*, of episcopal control.⁵

This monastic organization of the Celtic Church was an extreme development of a tendency which had declared itself to some extent in Early Christian Egypt;⁶ but, on the whole, it is less reminiscent of Christian than of Buddhist or Manichaean ecclesiastical institu-

¹ See Duke, J. A.: *The Columban Church* (Oxford 1932, University Press).

² Perhaps the closest parallel to this Irish Society with its monastic nuclei is the outpost of the Orthodox Christian Society which was established in Calabria by means of Basilian monastic foundations in the ninth and tenth centuries of the Christian Era. These monastic foundations in Calabria provided rallying-points for the settlement of Orthodox Christian refugees from Sicily. (See Gay, Jules: *L'Italie Méridionale et l'Empire Byzantin: A.D. 867-1071* (Paris 1904, Fontemoing.)

³ The titles "bishop" and "abbot" are used almost indiscriminately for the rulers of Armagh during the 6th and 7th centuries, justification for this usage being that every ruler held in fact the two (almost equally distinguished) offices. (Ryan, J.: *Irish Monasticism: Origins and Early Development* (London 1931, Longmans, Green and Co.), p. 171.) At Armagh the two offices were divorced between A.D. 750 and A.D. 790 (*op. cit.*, p. 172).

⁴ In this event, the abbot monopolized the administration, while the bishop devoted himself to sanctity and learning (Ryan, *op. cit.*, p. 172)—so much so that in Ireland the word abbot became synonymous with executive authority of any kind, spiritual or secular (Gougaud: *Christianity in Celtic Lands*, p. 83). For examples of tame bishops, see Ryan, *op. cit.*, pp. 180 and 301-2.

⁵ Ryan, *op. cit.*, p. 178. The most famous case of the kind is the constitution of the *Familia Columbae*, of which the Abbot of Iona was the head. For the Abbot of Iona was always only a presbyter, though the abbots of the affiliated monasteries were often bishops. (Duke, *op. cit.*, p. 120; Gougaud: *Christianity in Celtic Lands*, p. 136.)

⁶ For the ancestry of Irish monasticism, see Ryan, *op. cit.*, p. 407.

tions. As for the Irish itinerant bishops, there are parallels in the history of the Nestorian Church after its dispersion abroad among the oases of the Eurasian Steppe;¹ but the very notion of a bishop without a diocese was repugnant to the Orthodox and Roman churches, whose conceptions of ecclesiastical organization were thoroughly territorial owing to the fact that these churches had grown up within the framework of the Roman Empire and had taken for granted its systematic territorial articulation into municipalities and provinces.²

As for ritual, the Celtic Church became doubly differentiated from the Roman Church by its conservative attitude towards Roman innovations and its proneness to innovations of its own. It did not adopt the innovations which were made by the Roman Church during the period of segregation (*circa* A.D. 450-600) in the method of reckoning the date of Easter.³ On the other hand, it did adopt—possibly from the Druids—a peculiar form of tonsure;⁴ and it developed a hagiography of its own in which the Celtic Saints eclipsed, or at any rate attained an equal eminence with, the most exalted figures in the Old and the New Testament. Saint Patrick, for instance, was equated with Moses and Saint Bridget with the Virgin Mary herself.⁵

The literary studies which Christian liturgical requirements kept alive everywhere during the post-Hellenic interregnum bore fruit in Ireland in a greater mastery of the Latin Classics than was retained by the Christian Church in the *ci-devant* Roman provinces on the Continent where Latin remained the vernacular language. More remarkable still, the Irish ecclesiastical scholars contrived to

¹ See II. D (vi), pp. 237-38, above.

² For Irish monasteries and bishops, see Bury, J. B.: *The Life of Saint Patrick* (London 1905, Macmillan), pp. 174-84 and 375-9; Gougaud: *Les Chrétientés Celtiques*, pp. 215-19 and 232-4; Gougaud: *Christianity in Celtic Lands*, pp. 66-75; Ryan, S. J., the Rev. J.: *Irish Monasticism: Origins and Early Development* (London 1931, Longmans, Green and Co.). According to Ryan, Saint Patrick's organization was clerical rather than monastic, though Patrick approved of monasticism (pp. 92-3). The ecclesiastical centres (*civitates*) established by Patrick resembled monasteries (pp. 94 and 88-9). 'The place of monasticism in the church founded by Saint Patrick was important but secondary' (p. 96). However, 'the clerical community at Armagh was reorganized and reconstituted on a formally monastic basis' before the end of the fifth century (p. 101). In the early sixth century, Irish monasticism received an impulsion from Britain (pp. 114-16). And about the middle of the sixth century, under the British influence of Gildas, the Irish sees were transformed into monasteries (pp. 165-6). The influence of three Britons—St. David, St. Cadoc, and Gildas—upon Irish monasticism is also emphasized by Duke in *op. cit.*, on p. 50.

³ According to Bury (*in op. cit.*, pp. 371-4), the method of reckoning which prevailed in Ireland in the sixth and seventh centuries was a method which had been discarded by the Roman Church as early as A.D. 343. In other words, the Irish method was pre-Patrician; and Bury conjectures that it had been introduced into Ireland before Patrick's arrival—probably from Britain.

⁴ Bury, *op. cit.*, pp. 142-4 and 183 and 239-43; Gougaud: *Christianity in Celtic Lands*, p. 204.

⁵ Gougaud: *Les Chrétientés Celtiques*, pp. 260-6; *Christianity in Celtic Lands*, pp. 271-2.

recapture a command of the Greek language and literature, at a time when the knowledge of Greek was extinct in Latin Christian countries that were much less remote geographically than Ireland was from the living reservoir of Greek that survived in the East Roman Empire.¹ At the same time, the ardour of the Irish in studying the culture of the Hellenic Society from which their own embryonic culture had received its impetus did not prevent them from developing a vernacular literature of their own in the line of their pagan Celtic tradition.² And they showed their independence in the technical domain by working out a specifically Irish adaptation of the Latin Alphabet.³

The new style of art which emerged, during the post-Hellenic interregnum, in the nascent Far Western Christian World 'drew its inspiration from many seemingly incongruous sources . . . and welded their several elements together into a singularly harmonious unity'.⁴ There were elements from the Early Central European Iron

¹ The channel through which the Irish acquired their knowledge of Greek remains a mystery. Gougaud suggests Theodore of Tarsus, who taught Greek to a number of English pupils on the testimony of Bede (*Historia Ecclesiastica*, iv. 2, and v. 20 and 23). But this seems hardly likely, considering that Theodore arrived in England just after the conflict between the Roman and the Celtic Church had come to a head at the Synod of Whitby, and considering further that this Greek Archbishop of Canterbury took a strongly anti-Celtic line himself (*Christianity in Celtic Lands*, p. 423). Gougaud points out (in *Les Chrétientés Celtiques*, pp. 247-9) that the Irish mastery of Greek is non-proven for the period of Irish scholarship anterior to the ninth century of the Christian Era. On the other hand, the genuineness of the ninth-century Irish Hellenists (e.g. Johannes Scotus Erigena) is beyond question. (For details of John Scotus's proficiency in Greek, see Gougaud, *op. cit.*, loc. cit., and Sandys, J. E.: *A History of Classical Scholarship* (Cambridge 1903, University Press), pp. 473-8. In *Christianity in Celtic Lands*, on p. 309, Gougaud cites the warm testimony which is given to John Scotus by his contemporary, the papal librarian Anastasius, for his feat in making a Latin translation of the Greek Pseudo-Dionysius Areopagita.) In *Christianity in Celtic Lands*, on p. 308, Gougaud comes to the conclusion that 'in the second half of [the ninth] century a limited number of Irish emigrants on the Continent gave proof of some acquaintance with the [Greek] language'. But he finds no proof of Greek studies in the Irish schools in Ireland (*op. cit.*, p. 248). It was on the Continent that the Irish acquired their unusual learning, the evidence for which is all to be found in Continental manuscripts (*op. cit.*, pp. 250 and 309).

² Noteworthy . . . is the apparently matter-of-fact way in which zeal for studies, the higher as well as the lower, is worked into the Irish system. . . . Its explanation in Ireland is probably to be sought in the native schools of druids, fáthi, filid, bards, which preceded Christianity. The monks were felt to be the successors of the two orders first mentioned of these, and thus were expected to apply themselves not only to religion, but also to the cultivation of the intellect. When they likewise took up the study of the native language and literature, their extraordinary position in the life of the country was assured. (Ryan, *op. cit.*, p. 408.) The pre-Christian bardic schools, instead of being abolished when the monastic schools were instituted, were simply reorganized (apparently in A.D. 573, under the inspiration of Saint Columba, who had received a bardic education himself). Thereafter, the two systems of education flourished in Ireland side by side, performing complementary functions and mutually influencing one another (Graham, H.: *The Early Irish Monastic Schools* (Dublin 1923, Talbot Press), pp. 71-8). 'The union of the two cultures in the monastic schools probably began about A.D. 600' (Ryan, *op. cit.*, p. 377). The Latin orthography of the Irish language was definitely fixed before the end of the seventh century (Ryan, *op. cit.*, loc. cit.).

³ On this Irish script, see Gougaud: *Les Chrétientés Celtiques*, pp. 333-5; *Christianity in Celtic Lands*, p. 368; Ryan, *op. cit.*, p. 380.

⁴ Macalister, R. A. S.: *The Archaeology of Ireland* (London 1928, Methuen), p. 264. *Vide* ch. vi, 'The Principles of Irish Christian Art', and ch. vii, 'The Expression of Decorative Christian Art in Ireland', *passim*.

Age culture of La Tène—the culture of the pagan Celts at the time of their impact upon the Hellenic World in the fifth to third centuries B.C.¹ There were elements from the art of the Eurasian Steppe, which had been brought into Western Europe by the Sarmatian Nomads who broke through the Roman frontier, in company with the vanguard of the Teutonic trans-frontier barbarians, in the post-Hellenic Völkerwanderung.² There were elements from Hellenic art, and from the Syriac art which had eventually dominated and permeated and transformed Hellenic art from end to end of the Roman Empire. This new art was not confined to Ireland or even to 'the Celtic Fringe' as a whole. It was a common possession of the whole North European external proletariat of the Roman Empire.³ It was in Ireland, however, that it attained its zenith—particularly in the illumination of parchment manuscripts and in the carving of stone crosses—and the influence of this Irish art radiated into England and Scandinavia,⁴ and impressed itself upon the kindred art there, besides making itself felt in Continental Western Christendom.

Within a century of Saint Patrick's mission in Ireland (*Patricius in Hibernia Fidem propagabat circa* A.D. 432–61), the embryonic Far Western Christian Civilization, derived from the germs which he had planted, had not only developed on its own distinctive lines but had actually shot ahead of the nascent Western Christian Civilization on the Continent. This initial superiority of the Insular over the Continental culture was due in part to the positive cause which we have considered already—the creative reaction of an indigenous Celtic Barbarism to an intrusive Christianity during a century and a half of segregation—and partly perhaps to the negative advantage which Ireland enjoyed during the post-Hellenic interregnum in being immune from the Frankish and Lombard invasions which devastated Gaul and Italy only less cruelly than the English invasion devastated Britain.⁵ But, however the superiority is to be explained, the fact is manifest. It was doubly proved, when the period of segregation came to an end towards the close of the sixth century of the Christian Era, by the warmth of the welcome which Irish missionary monks and scholars received in Britain and on the Continent, and by the eagerness with which English and Continental students sought out the Irish monastic schools, where foreigners were generously furnished with food and lodging and books and

¹ For this impact and its repulse, see pp. 279–82 and 319, above.

² The distinctive contributions of this Eurasian art were 'the Animal Style' and 'Polychromy' (see Rostovtzeff, M.: *Iranians and Greeks in South Russia* (Oxford 1922, Clarendon Press)).

teaching gratis.¹ The period of Irish cultural superiority over the Continent and over Britain may be conventionally dated from the foundation of the monastic university of Clonmacnois in Ireland in A.D. 548² to the foundation of the Irish monastery of St. James at Ratisbon *circa* A.D. 1090. Throughout those five and a half centuries, it was the Irish who imparted culture and the English and the Continentals who received it. But this transmission of culture was not the only social consequence of the renewal of contact between the Insular and the Continental Christendom of the West. Another consequence was a contest for power. In this conflict, the issue at stake was whether the future civilization which was to emerge in Western Europe should derive from an Irish or from a Roman embryo; and the Irish were defeated in this trial of strength long before they lost their cultural ascendancy.

The issue was raised by the great movement of missionary expansion to which the Irish monks were inspired, by their peculiar spirit of 'adventurous asceticism',³ in the latter part of the sixth century of the Christian Era. In this manifestation of youthful energy, monastic Ireland anticipated papal Rome. While Pope Gregory the Great's emissary Augustine did not cross the sea from the Continent to Britain, on his mission of converting the pagan English, until A.D. 597, St. Columba had already crossed the sea from Ireland to Britain *circa* 563 to found a Christian cell on the Island of Iona among the Scots whose forefathers had migrated thither from Ireland a century or so before;⁴ while, *circa* 590, St. Columbanus had crossed from Ireland to Britain and from Britain to the Continent itself. Columbanus reached the Lake of Constance in 610 and crossed the Alps in 613; and the simultaneous settlement, in the latter year, of Columbanus himself at Bobbio and of his companion Gallus at the spot where his name was afterwards commemorated in the monastery of St. Gall,⁵ anticipated

¹ Bede: *Historia Ecclesiastica*, iii. 47. For a list of distinguished foreign students who studied in the Irish monastic schools, see Graham, H.: *The Early Irish Monastic Schools* (Dublin 1923, Talbot Press), pp. 84-90. The list includes Welsh, English, and Frankish names—among them, the name of Willibrord, the apostle of the Frisians (Gougaud: *Christianity in Celtic Lands*, pp. 257-8). The Northumbrian English refugees who studied in Ireland learnt to speak Gaelic and even to write in it (op. cit., p. 248). There are Irish verses which are attributed to the Northumbrian King Aldfrid (*regnabat* A.D. 686-705), the son of the King Oswiu who presided, with such momentous results, at the Synod of Whitby (see pp. 334-6, below). On the question of English and Continental students in Ireland in the seventh and subsequent centuries, see also Gougaud: *Les Chrétientés Celtiques*, pp. 251-2.

² The earliest of all the Irish monasteries seems to have been Cell Enda, on the largest of the Arran Islands, whose eponymous founder died in A.D. 530. (Gougaud: *Christianity in Celtic Lands*, p. 67.)

³ See the quotation from Öliuk on p. 324, above.

⁴ Duke points out (in op. cit., on p. 12) that Columba died in the year of Augustine's arrival.

⁵ Gougaud points out (in *Christianity in Celtic Lands* on pp. 143 and 158) that a regularly organized monastery was not established at St. Gall till nearly a century after the eponym's death on that spot.

by twelve years the arrival of the Roman missionary Paulinus in York.

Pressing boldly into the interior of the Continent, Columbanus founded his first Continental cluster of cells in the heart of the Frankish dominions, on the borders of Burgundy, Swabia, and Austrasia, at Annegray, Luxeuil, and Fontaines; and the choice of these sites testifies to the founder's strategic intuition. It is no accident that Luxeuil lies within a hundred miles of Metz—the point of intersection of the two co-ordinate lines in the eventual structure of Western Christendom¹—and within less than a hundred miles of La Tène, which lies in the heart of the region from which the Celtic barbarians had expanded a thousand years earlier in their counter-attack upon the Hellenic World in the fifth to third centuries B.C.² At Luxeuil the pioneer Celtic monk Columbanus and his companions, like their prototypes the pioneer Celtic barbarians at La Tène, commanded an ideal base for operations in all quarters of the Continent. While La Tène lies at the outlet of the Lake of Neuchâtel in the upper basin of the Aar, in the gap between the Jura and the Alps, Luxeuil stands by the head-waters of the Saône, in the gap between the Jura and the Vosges. From either base, it is equally easy to descend upon the basin of the Rhône and the basin of the Rhine and hardly less easy to reach the basins of the Seine and the Danube. The Celtic war-band at La Tène and the Celtic fraternity at Luxeuil each, in their day, took full advantage of the commanding strategic position in which they found themselves. Their expansions over the face of the Continent from these two neighbouring starting-points followed identic routes and were pursued with an equal energy.

The likenesses and the differences between the first and the last of the Celtic expansions cannot fail to exercise a historian's imagination. The very closeness of the physical points of resemblance brings into relief the sharpness of the spiritual contrast. The first Celtic expansion was a warlike *Völkerwanderung*, the last an ascetic pilgrimage; and while the legendary barbarian war-lord Bellovesus came to destroy the Hellenic culture, the historical Christian missionary Columbanus trod in Bellovesus's footsteps in order to re-sow the seeds of culture in lands where Bellovesus's Teutonic barbarian successors had trampled the harvest of Hellenism into the mire. At Luxeuil, Celtic monks reoccupied a derelict Roman watering-place,³ as a Celtic war-band had once occupied a derelict Etruscan

¹ See I. B (iv), vol. i, pp. 37-9, above.

² See pp. 279-82 and 319, above, for this Celtic counter-attack upon the Hellenic World and its failure.

³ Gougaud points out (in *Christianity in Celtic Lands* on p. 83) that Celtic monasteries were in the nature of pioneer settlements, and that deserted sites were favourite locations for them.

city at Milan; but the difference in the circumstances was all-important; for Etruscan Milan had been laid desolate by the Celtic invaders themselves, whereas the Irish reoccupants of Luxeuil re-inhabited a Roman site which had been desolated by others, and dedicated it to a nobler service than its original use. At Bobbio, Columbanus founded a Celtic monastery in an Apennine valley which the Celtic invaders of Italy in the fifth century B.C. had never reached;¹ and this latter-day Celtic stronghold in Liguria, commanding a passage across the Apennines from Northern Europe to Rome, was not an outpost of barbarism but a light of freshly kindled civilization shining in the darkness of a barbarized Italy. The sister foundation of St. Gall—a still more famous daughter of Luxeuil—occupied an equally commanding position on the high road leading out of Western Europe into the Danube valley, where it radiated a light of equal brilliance upon the darkness of a still pagan Bavaria.

There is, however, one point of likeness between the two Celtic expansions on the Continent which is of the highest historical importance. In the seventh century of the Christian Era, as in the fourth century B.C., the expanding Celts came into collision with Rome; and in the second of these encounters they were defeated as decisively as they had been defeated a thousand years earlier.

The conflict between the Irish and the Roman Church in the seventh century was perhaps the inevitable result of a profound difference of *ethos* which had arisen during the century and a half of segregation, and which declared itself as soon as the Irish missionary expansion brought the two parties into contact again. Under the stress of the breakdown of the Hellenic Society and the break-up of the Roman Empire, the Roman Church had sought to save the situation by salvaging, and making its own, those traditions of discipline and unity for which the defunct secular Roman order had formerly stood, whereas the Irish Church, in its peculiar isolation and security, had indulged, if not cultivated, a libertarian genius. When these two thus sharply differentiated churches met, it was the Irish Church that bridged the physical gulf and the Roman Church that took the human offensive.

The temporary segregation of the Irish Church had been involuntary and not deliberate;² and when the Irish pioneer-missionaries eventually landed on the Continent and thereby re-established contact with Continental Christendom, they were evidently unconscious of having drifted away from Roman practice themselves and unaware that Roman practice had parted company with theirs.

¹ There is, however, some shadow of evidence for Celtic settlements in the north-western Apennines as early as the seventh and sixth centuries B.C. (See Hubert, *op. cit.*, pp. 322-32.)

² On this point, see Bury, *op. cit.*, pp. 213-15.

They simply continued on their own course, on the assumption that their native Irish Christianity was the Christianity of the Catholic Church;¹ and in their intercourse with their Continental co-religionists, including the Pope himself, they exhibited the freedom and the self-confidence to which they were accustomed in their dealings among themselves.

Columbanus, for example, appears to have established his cluster of monasteries in Burgundy without consulting the local Burgundian ecclesiastical authorities; he certainly introduced his own Irish monastic rule;² and he celebrated Easter according to a method of reckoning, still employed in Ireland, which had been discarded on the Continent since A.D. 343.³ When he was taken to task on this last account by the representatives of the Gallican Church, he counter-attacked by upbraiding the Pope himself, in an open letter, for adhering to the newfangled Continental system. The particular Pope whom Columbanus thus roundly threatened in A.D. 600 with the penalty of being 'looked upon as a heretic and rejected with scorn by the Churches of the West' was none other than Gregory the Great himself: the very incarnation of the new Roman ecclesiastical imperialism! Columbanus wrote with equal frankness to the Gallican synod at Châlon-sur-Saône before which he was arraigned in A.D. 603; and he addressed a third letter on the Paschal Controversy to one of Gregory's successors on the Papal throne.⁴ His independent attitude towards the authorities of the Continental Western Church on this question of ecclesiastical practice, and his equal independence in denouncing the political and personal crimes of the Frankish Queen Brynhild,⁵ eventually led to his being evicted from Gaul in A.D. 610—whereupon the Irish saint followed the example of Saint Paul and turned his back upon his co-religionists in order to preach to the Gentiles. He travelled on from Christian Burgundy into pagan Bavaria, and it was thus that he reached Lake Constance;⁶ but this was not the end of his pilgrimage. For in A.D. 612 he left the shores of Lake Constance and descended, from

¹ This assumption seems to underlie the concluding passage in St. Columbanus's letter to the synod at Châlon-sur-Saône before which he was arraigned in A.D. 603. (See below.)

² The attractiveness of the Irish Christian culture to the Continental Christians of the day is illustrated by the fact that 'the rule of Saint Columbanus soon became the object of such veneration that, towards the middle of the seventh century, many Gallic cloisters adopted it simultaneously with the rule of St. Benedict'. (Gougaud, *Les Chrétiens Celtiques*, p. 146; cp. *Christianity in Celtic Lands*, p. 141.)

³ See p. 326, above.

⁴ For Columbanus's three letters on the Paschal Controversy, see Gougaud: *Les Chrétiens Celtiques*, pp. 180-3; and Kerr, W. S.: *The Independence of the Celtic Church in Ireland* (London 1931, S.P.C.K.), ch. v. An attempt to explain away the conflict between Columbanus and the Papacy in particular, and between the Irish Church and the Roman Church in general, is made by Ryan in op. cit., on pp. 302-5; but this exposition is not convincing. Duke points out (in op. cit., on p. 131) that, in Adamnan's *Life of St. Columba*, the Papacy is never mentioned.

⁵ For details, see Ryan, op. cit., pp. 308-12.

⁶ See p. 329, above.

this unexpected quarter, upon Italy; and his spirit was so far from being broken by his experiences in the Paschal Controversy that, between his settlement at Bobbio in 613 and his death two years later, he found time to engage in another controversy with another pontiff!¹

This independent spirit of Irish Christendom, which Columbanus displayed in the seventh century, was still alive in the ninth.

On the moral plane, the spirit reveals itself in a gloss written by an Irish hand and in the Irish language on the margin of a ninth-century manuscript of the Epistles of St. Paul:²

'To go to Rome is great labour and little profit. Thou wilt not find the King that thou goest to seek there unless thou bring Him with thee. It is folly, frenzy, insanity, unreason—since thou goest out to meet certain death—that thou shouldest call down upon thee the wrath of the Son of Mary.'

With the moral insight of this ninth-century Irish gloss, which conveys in two sentences the theme of Tolstoy's fable of the Two Pilgrims, we may equate the intellectual vigour and originality of the ninth-century Irish Hellenist, philosopher, and theologian, Johannes Scotus Erigena: the giant of the Carolingian Renaissance, whose like was not seen again in Western Christendom until the Italian Renaissance of the fifteenth century. In his magnum opus *De Divisione Naturae* (*scriptum circa* A.D. 867), Erigena dared to present Philosophy as an independent discipline on an equal footing with Theology, and to declare that where philosophic reason and theological authority conflict, reason and not authority must prevail.³

The struggle for power which was perhaps rendered inevitable by this striking difference in ethos between the libertarianism of Ireland and the authoritarianism of Rome was brought to a head by a competition for the conversion of the still pagan barbarians of

¹ For Columbanus's letter to Pope Boniface IV on the Controversy of 'the Three Chapters', see Kerr, *op. cit.*, ch. xii.

² The Codex Boernerianus in the Royal Library at Dresden. Translations of the gloss are given in Gougaud: *Les Chrétientés Celtiques*, pp. 158-9; and in Zimmer, H.: *The Irish Element in Mediaeval Culture* (English translation: New York 1891, Putnam), p. 126. For a critical examination of this gloss, see Gougaud: *Christianity in Celtic Lands*, p. 169.

³ For Johannes Scotus see Gougaud: *Les Chrétientés Celtiques*, ch. viii, especially pp. 280-1; *Christianity in Celtic Lands*, pp. 288-9; Zimmer, *op. cit.*, pp. 57-60; Sandys, J. E.: *A History of Classical Scholarship* (Cambridge 1903, University Press), pp. 473-8. Erigena's independence of mind showed itself not only in the domain of Philosophy but also in that of Physical Science. For example, he believed in the existence of the Antipodes. In this belief he had perhaps been anticipated by an eighth-century Irish missionary scholar, Virgil, bishop of Salzburg (*episcopabatur* A.D. 767-84), who was denounced on this account to Pope Zacharias by the English missionary Boniface. The pope gave orders that if Virgil really did believe in the Antipodes, he was to be excommunicated and unfrocked. In this controversy, the Irishman appears to have got the better of the Englishman; for, after holding the see of Salzburg against Boniface since A.D. 745 as a mere presbyter, Virgil became a bishop after Boniface had become a martyr. (For this Irish Virgil, see Gougaud: *Les Chrétientés Celtiques*, pp. 242-3; *Christianity in Celtic Lands*, p. 151; Sandys, *op. cit.*, p. 448; Hodgkin, T.: *Italy and her Invaders*, vol. vii (Oxford 1899, Clarendon Press), pp. 122-3. Some scepticism in regard to Virgil's supposed views is exhibited by Gougaud in *Christianity in Celtic Lands* on p. 256.)

Northern Europe on the Continent and in Britain. It was manifest that—in a region where there was no room for two separate civilizations to come to birth and grow up side by side—the unitary Western Christendom of the future would spring from whichever of the two embryonic societies that were now emerging at opposite extremities of this region should succeed in capturing the barbarian hinterland. The battle between the Irish and the Roman competitors for the privilege of becoming the creators of our Western Civilization was fought out, between the years 625 and 664, in the northernmost English successor-state of the Roman Empire, Northumbria, and was decided in the latter year at the Synod of Whitby.

The race between the Roman and the Irish Church for the prize of Northumbria was closely run. The Roman missionary Paulinus reached York in A.D. 625, and in 627 he converted the Northumbrian prince Edwin—the founder of Edinburgh¹—who had asserted a political hegemony over the larger part of Britain. In 633, however, Edwin lost both his dominion and his life in battle with the pagan Penda of Mercia; and Christianity was reintroduced into Northumbria by Edwin's successor Oswald: the representative of a rival dynasty who had repaired in exile to Iona and had been converted to Christianity there. The new ruler of Northumbria naturally sought missionaries for his subjects in the sanctuary where he had found his own faith. He addressed himself to Iona and not to Rome; and the monks of Iona, who had already converted the Picts, in the northern extremity of Britain, from their islet-cell off the west coast, now established a new cell off the east coast of Britain on the islet of Lindisfarne (Holy Island) as a base of operations for evangelizing Oswald's Northumbrians in the first instance and the rest of the English in due course.

In the middle of the seventh century, when Northumbria was under this Irish ecclesiastical ascendancy, the prospects of the Far Western Christendom in Britain seemed promising. The Irish Christians were not alienated from the English by the implacable hatred that animated the British Christians of Wales and West Wales and Strathclyde; for, during the recent *Völkerwanderung*, the Irish and the English had never crossed one another's path, since their common victims, the Britons, whom they had assailed simultaneously from opposite sides, had always interposed a human 'buffer' between them. The English barbarians, on their part, were even more susceptible to the attractions of the superior Irish culture which was offered to them by the Ionan missionary Aidan than the somewhat less barbarous peoples who had recently welcomed the advent of Columbanus on the Continent. Moreover, the North-

¹ See II. D (v), p. 191, above.

umbrian principality, which was Aidan's immediate field of work, recovered momentarily in 655, under Oswald's brother and successor Oswiu, the hegemony which it had already won and lost under Oswald's predecessor Edwin. Thus a number of social and political factors were working together for the cultural union of the Teutonic with the Celtic peoples of the British Isles under the aegis of a common Far Western Christendom. In these circumstances, Northumbria was unexpectedly recaptured for the Roman Church by the influence of Eanfled, Oswiu's queen, who had been brought up in the Roman practice, and by the energy of Wilfrid, a native Northumbrian cleric who had become an ardent Romanizer. At the Synod of Whitby, where the issue was decided in A.D. 664, the rival claims of Rome and Iona were nominally debated on the merits of the Paschal Controversy; but this trivial point of ritual was merely the test question in a trial of strength between two ecclesiastical powers, and King Oswiu gave his allegiance to Rome because he came to the conclusion that Peter was stronger than Columba.¹

The consequences of Oswiu's decision were momentous. The immediate external effect was the restoration of a uniformity of practice in the Western Church. The Picts, the Irish, the Welsh, and the Bretons successively accepted the Roman Easter and the Roman tonsure in the course of the eighth century; and Iona itself submitted as early as the year 716. Yet even this half-century's delay deprived the Ionan missionaries of all the ground which they had won by a century of effort in Britain. They had to evacuate Northumbria on the morrow of Oswiu's decision in 664,² and all Pictland east of the Grampians on the morrow of an identic decision which was taken by the Pictish King Nectan in 710. Moreover, in making this formal act of submission to Rome, Celtic Christendom publicly renounced its independence without obtaining any counter-vailing material benefits; for the questions of Easter and the tonsure, which had been taken as the test questions in the struggle for power, were by no means the only points on which the Celtic Churches had become peculiar. The residue of the Celtic peculiari-

¹ Wilfrid convinced Oswiu by quoting the text: 'Thou art Peter; and upon this rock I will build my Church; and the gates of Hell shall not prevail against it. And I will give unto thee the keys of the Kingdom of Heaven; and whatsoever thou shalt bind on Earth shall be bound in Heaven; and whatsoever thou shalt loose on Earth shall be loosed in Heaven.' Turning to Colman, the Ionan Abbot of Lindisfarne, who was the spokesman of the Ionan party at the synod, Oswiu asked him (i) whether the text quoted by Wilfrid was genuine, and (ii) whether Colman could quote any text showing that equivalent powers had been granted to Columba. When Colman answered the first of these two questions in the affirmative and the second in the negative, Oswiu closed the debate by opting for allegiance to Rome, 'lest, when I come to the gates of the Kingdom of Heaven, there should be none to open them, he being my adversary who is proved to have the keys'.

² They still held out in the Northumbrian monasteries—particularly at Lindisfarne, which appears to have clung to the Ionan practice for another half-century (Duke, *op. cit.*, pp. 102-6).

ties was still sufficient to incline the rest of Western Christendom to regard the Celtic Christians as remaining in some sense beyond the Catholic Pale; and these Celtic ecclesiastical peculiarities did not entirely disappear—either in Wales or in Brittany or in Scotland or in Ireland—until the close of the twelfth century.

Thus, from the date of the Synod of Whitby onwards, the embryonic Christendom of the Far West was thrust back again into the state of isolation from which it had been released for a moment by the missionary efforts of a Columba and a Columbanus. But the last state of this abortive Far Western Christendom was worse than the first. For the iron which had entered into the soul of the Welsh with the agonies which they had suffered during the English *Völkerwanderung* now entered into the soul of the Irish likewise with the humiliation of their rebuff from Northumbria. The whole of the Celtic Fringe was thus now alienated from England; and at the same time the English had become much more formidable than before to the surviving insular Celts as an aggressive hostile force. Instead of being a swarm of pagan barbarians who were as abhorrent to the Continental Christians as to the British Christians themselves, the English had now become the obedient humble servants of the new ecclesiastical empire of Rome—fighting the Papacy's battles and receiving in return the Papacy's support.

From the latter part of the seventh century onwards the pressure of England upon the Celtic fringe had the whole weight of Continental Western Christendom behind it; and this weight gave the subsequent English drives against the Irish an irresistible impetus. The first of these new drives was made, not in the British Isles but on the Continent, where, in the early decades of the eighth century, the outer fringe of the Continental Teutonic countries under Frankish political suzerainty—Frisia, Hesse, Thuringia, Bavaria—was won for the Roman Church by the English missionary Boniface (*baptizatus* Wynfrith) not so much from a primitive paganism as from the Far Western Christianity of the pioneer Irish missionaries whom Boniface found already at work in this field. The English champion of Rome deliberately ousted these Irish pioneers who had blazed the trail for him, in order that on the Continent, as in Britain itself, the Roman Church might enter into the Celtic Church's missionary labours.¹ In the British Isles, more than four centuries

¹ For Boniface's devotion to the Papacy and warfare against his own Irish predecessors in the Central European mission field, see Gougaud, *Les Chrétientés Celtiques*, pp. 153-5, and Hodgkin, T.: *Italy and her Invaders*, vol. vii (Oxford 1899, Clarendon Press), pp. 81-4. Zimmer points out (in *op. cit.*, p. 32) that Boniface's immediate forerunner, Willibrord, the apostle of Frisia, was Irish-trained. (See p. 329, footnote 1, above.) For the measures taken by the Continental ecclesiastical authorities to restrain the Insular *vagantes*, from the second quarter of the eighth century onwards, see Gougaud: *Christianity in Celtic Lands*, pp. 165-7.

later, the Anglo-Roman alliance against the Celts was still in operation. King Henry II's raid in A.D. 1171, which completed the first step in the long-drawn-out English conquest of Ireland itself, was made on the authority of a Papal Bull.¹

Henry II's expedition to Ireland opened the third act of a tragedy in which the first act had been closed by the Synod of Whitby. The intervening second act was the Irish reaction to the ordeal of the Scandinavian *Völkerwanderung*. In contrast to the foregoing Teutonic *Völkerwanderung* which had accompanied the break-up of the Roman Empire, the Scandinavian outbreak did not spare Ireland; and the Far Western island which had been immune from the storms of the fifth to seventh centuries was harried in the ninth to eleventh centuries as cruelly as Britain or the Continent. The Vikings first completed the eradication of Irish influence from Britain by sacking Lindisfarne in A.D. 793 and Iona in A.D. 802;² and thereafter they dealt such heavy blows to the nascent Far Western Christian culture in Ireland itself that not a single Irish monastery escaped,³ and, as far as is known, not a single work in Latin was written in Ireland during the ninth century of the Christian Era (the century in which the scholarship of the Irish refugees on the Continent stood at its zenith).⁴ The Irish did not yield any more tamely to their Scandinavian assailants than the English or the French; and in the end the physical progress of Scandinavian conquest in Ireland was arrested definitively by the Irish victory in which Brian Boru met his death at Clontarf. Yet the same Scandinavian challenge that was literally the making of England and France, because it stimulated the French and English peoples to the optimum degree,⁵ presented itself to Ireland, in her renewed isolation, with such excessive severity that she could win no more than a Pyrrhic victory.

The repulse of the physical assaults of Scandinavian raiders on France and England was followed by a spiritual counter-offensive on the part of Continental Western Christendom; and the outcome was a rapid and thorough-going cultural conquest of the Scandi-

¹ The Bull *Laudabiliter*, addressed to King Henry II of England by Pope Hadrian IV in A.D. 1155, was the response to a request which the King had made for Papal approval of his projected enterprise. The Pope acceded to the King's request on the ground that an English conquest of Ireland would enlarge the bounds of the Church and bring knowledge of the Truth to ignorant and barbarous peoples. The authenticity of this Bull has been disputed without, apparently, being effectively impugned. (See Gougaud: *Les Chrétientés Celtiques*, p. 367; *Christianity in Celtic Lands*, p. 408; and Kerr, *op. cit.*, pp. 151-2.) The history of the three-cornered relation between Rome, England, and Ireland is discussed further in Annex II, below.

² Gougaud: *Christianity in Celtic Lands*, p. 391. At Iona, the monks were massacred in the subsequent visitations of A.D. 806 and 825.

³ Gougaud: *Christianity in Celtic Lands*, p. 392.

⁵ For the victorious response of the French and English to the challenge from the Scandinavians, see II. D (v), pp. 198-202, above.

navian intruders who had secured a physical lodgement on French and English soil. In three or four generations the descendants of the Norse assailants of Western Christendom became her Norman champions;¹ and a filibustering band of freelance Norman knights, which crossed St. George's Channel in A.D. 1169, was the advance-guard of King Henry II's expedition to Ireland. On the other hand, the victory of Clontarf, which was 'the crowning mercy' in the long Irish struggle against the same Norsemen, was not followed by any corresponding conversion of the Scandinavian intruders who still managed to keep their footing on the coasts of Ireland to the culture of the Irish hinterland. Notwithstanding the manifest attractiveness and assimilative power of the Irish culture, and the profound cultural interactions which did in fact take place between Ireland and Scandinavia, the 'Ostmen', in their five surviving city-states on Irish soil,² remained a people apart; and on a minor scale they played the same role towards Ireland as the English. In the first phase of the Scandinavian *Völkerwanderung*, before the conversion of the intruders to Christianity, the Viking masters of the Irish coasts and seas isolated the Irish people from the main body of Western Christendom as effectively as they had been isolated by the lodgement of the pagan English in Britain during the first phase of the Teutonic *Völkerwanderung* of the fifth and sixth centuries. In the second phase, the converted Ostmen, like the converted English, stole a march upon the Irish by entering into more intimate relations than the Irish themselves had established with Continental Western Christendom. In the twelfth century, when Ireland succumbed successively to the ecclesiastical authority of Rome and the political authority of England, the Ostmen lent themselves readily (though ultimately to their own undoing) as instruments in both these deadly assaults upon Ireland's independence.

Thus the embryo of a Far Western Christian Civilization, which showed such promise of life towards the close of the post-Hellenic interregnum, was ultimately rendered abortive by the strain of having to respond to a series of challenges which were excessive in their severity. It was a forlorn hope for the Celtic abbot Colman, in his islet off the coasts of Ultima Thule, to emulate the prowess of the Oecumenical Patriarch of Constantinople by trying conclusions with the successor of the Apostle at Rome; and it was a forlorn hope for the Irish to emulate the prowess of the English and the French in resisting the onslaught of the Norsemen. The gallantry of the Irish in facing these fearful odds did not enable them to survive in a human environment which was insuperably

¹ On this point see II. D (v), p. 201, above.

² For these five Scandinavian city-states on the coasts of Ireland, see II. D (iii), p. 98, above.

adverse; and instead of creating a new civilization of their own it was their fate to be laid under contribution by the very competitors who were robbing them of their birthright of independent creation. Irish scholarship was made to minister to the progress of the Continental Western Christian Civilization when Irish scholars, fleeing from Ireland as refugees from Scandinavian onslaughts, were enlisted in the service of the Carolingian Renaissance;¹ and Irish art and literature served to inspire the art and literature of the Scandinavian aggressors themselves² and thus likewise helped to enrich the culture of Continental Western Christendom indirectly, through a side channel, when the abortive Scandinavian Civilization succumbed in its turn to a rival which proved more than a match for the Teutonic as well as the Celtic rear-guard of the North European Barbarism.³

These Irish contributions to the life of a Western Civilization of non-Irish origin were not even the most conspicuous contributions which medieval Western Christendom levied from the vanquished and discarded peoples of 'the Celtic Fringe'. In spite—or possibly just because—of the predominant part which the Irish had played among the Celtic Christian peoples in inspiring the embryonic Far Western Christian Civilization with its abortive vitality, the Latin (unlike the Scandinavian) genius was not attracted by the exuberant Irish imagination. In the twelfth century, when the possibilities of the French Epic had been exhausted and when French poets were on the look-out for some exotic inspiration, they found what they wanted not in Ireland—the Celtic island which had almost wrested from the Latin Continent the role of creating the new Western Civilization—but in Britain: a Celtic island which had fallen out of the running before the race between the Irish and the Latins had begun. It was no 'matter of Ireland' but 'the matter of Britain' that appealed to a Chrétien de Troyes; and if the Celtic imagination is a living force in the World to-day, it lives in the legend of the heroic failure of Arthur, and not in the history of Columba's or Columbanus's heroic success.

The measure of the difference in *éthos* between the Irish vein of the Celtic imagination, which left the Latin mind cold, and the Welsh vein, which took the Latin mind by storm, is given by a significant dissimilarity in the treatment of a mythical Celtic theme which the Welsh and the Irish had each cultivated in their respective manners. The peoples of 'the Celtic Fringe', with the Atlantic at their backs and a host of formidable aggressors ever bearing down upon them from the Continent, were naturally inspired to seek imaginative relief from the pressure of an adverse human

¹ Gougaud: *Christianity in Celtic Lands*, p. 311.

³ See pp. 340-60, below.

environment by dreaming of an Elysium hidden in the bosom of the Ocean: a magic island which a Celtic hero might reach under the guidance of superhuman powers who would never give right of way to the hero's alien adversaries. This Elysium is the common dream of the Far Western Celtic peoples; it is the bourne alike of King Arthur and of Saint Brendan; but, in the British and the Irish heroic cycles, the hero's magic westward voyage is made in utterly different circumstances. The vanquished British warrior is wafted away to Avalon in order to find an asylum where he may depart this weary life in peace; the adventurous Irish Saint bends his sails towards the island of his dreams in order to lead a new life on this Earth in a land of hope. The fantasy of Avalon consoled the grief of the Britons when the waters of the English conquest were going over their souls; the fantasy of Saint Brendan's Isle inspired—or reflected—the feat of the Irish when they were anticipating the Norsemen in the discovery of the Faroes and of Iceland.¹

The Abortive Scandinavian Civilization

It will be seen that, in the hard-fought contest between Rome and Ireland for the privilege of becoming the creator of a new Western Civilization, Rome only just succeeded in gaining the upper hand. And when the nascent Western Christendom which was thus enabled to develop from a Roman embryo was still in its infancy, it had to engage, after the briefest breathing-space, in a second struggle for the same prize—this time in conflict with the Teutonic rear-guard of the North European Barbarism which had been holding itself in reserve in Scandinavia.

In this conflict between the Scandinavians and Western Christendom, the issue was as doubtful as it had been in the foregoing conflict between the Irish and the Roman Church, while the circumstances were more formidable. On this occasion, the trial of strength was made on the military as well as on the cultural plane; the contest was on a far larger material scale; and the two contending parties were severally stronger, and also more alien from one another, at the time of decision in the ninth century, than the rival Irish and Roman embryos of Western Christendom had been at the decisive moment in their antecedent contest, some two centuries earlier. On the one hand, the superiority in strength of ninth-century Western Christendom over its seventh-century Roman embryo is conspicuous. The measure of the difference is given by the political and cultural vitality of the eighth-century Western Christian Civilization as this was manifested in the lives and works of its great protagonists: a Bede and a Boniface, a Liutprand and a

¹ For the Irish monks who preceded the Norsemen in Iceland, see Gougaud: *Christianity in Celtic Lands*, pp. 131-2.

Charles Martel, and, above all, a Charlemagne. On the other hand, the Scandinavian adversaries of the Carolingians surpassed the Irish rivals of Pope Gregory the Great or Bishop Wilfrid in weight of numbers and power of action at least as conspicuously as ninth-century Western Christendom surpassed seventh-century Western Christendom in the same respects.

The history of the Scandinavians in and after the post-Hellenic *Völkerwanderung* of the fifth, sixth, and seventh centuries of the Christian Era was in some ways like the contemporary history of the Irish and in some ways different from it.

To consider the points of likeness first: the Scandinavians, as well as the Irish, had been drawn within the ambit of the Hellenic external proletariat before the break-up of the Roman Empire; and in Scandinavia, as in Ireland, the effect of the ensuing *Völkerwanderung* was to insulate this portion of the barbarian hinterland, rather abruptly, from the cultural radiation, proceeding out of the body social of the moribund Hellenic World, to which it had latterly been exposed.

Just as Ireland was isolated from Roman Christendom before the end of the fifth century by the interposition of the pagan English invaders who had crossed the North Sea and made a lodgement in the Roman island of Britain, so Scandinavia was isolated from Roman Christendom before the end of the sixth century by the interposition of the pagan Slavs, who drifted overland along the southern shores of the Baltic, from the line of the Niemen or the Vistula to the line of the Elbe and the Saale, into the vacuum left by the emigration of the Goths, Vandals, Heruli, Warni, Lombards, and other Teutonic barbarians who had evacuated this region because they had been implicated in the post-Hellenic *Völkerwanderung* and had been lured away by its spell to inflict and suffer destruction in the derelict provinces of the Roman Empire, while the Scandinavians, in 'the back of beyond', had stayed at home. Thus, before the close of the post-Hellenic interregnum, the Scandinavians found themselves isolated from their fellow Teutons, as the Irish were isolated from their fellow Christians, by a wedge of more barbarous interlopers.¹

¹ 'The conditions for a separate Scandinavian development were not created until the Migration of Nations, which definitely broke the bonds uniting the northern Teutonic tribes with their southern neighbours. The Angles and Saxons travelled to England; the Svevi and Goths moved southward. The lands along the Baltic were for a time deserted, but were slowly filled with a new population. Slavic tribes trickled in from the east, settling the shores of the Baltic as far west as Holstein. . . .

'Thus sharp boundaries of language had been drawn around the North, and at the same time the unrest in Central Europe had cut off the ancient connexions with the South. There had once been physical contact with the Romano-Germanic Civilization; now the bridge had been broken, and the North was thrown on its own resources.' (Olrik, op. cit., p. 8.)

There was, however, one difference between the Scandinavian and the Irish situation which was of fundamental importance and lasting effect. While the previous cultural radiation out of the Roman Empire into Ireland had just succeeded in kindling a spark of Christianity in Ireland before the interposition of the English, the feeble incidence of the same radiation upon Scandinavia had failed to produce the same effect there before the interposition of the Slavs. While the Irish barbarians were converted in the fifth century and the vanguard of the Teutonic barbarians who overran the Continental provinces of the Roman Empire were converted as early as the fourth century,¹ the rear-guard of the Teutons in Scandinavia were still pagans in the sixth century when segregation overtook them; and they therefore remained pagans so long as the segregation lasted and emerged as pagans when it came to an end. Thus the cultural histories of Ireland and of Scandinavia during their respective segregation-periods were markedly different. In Ireland, in this age, there was a mingling of the old wine of North European Barbarism with the new wine of Christianity; and this mingling had produced a creative fermentation—the potential genesis of a new civilization—before the segregation-period had reached its close.² In Scandinavia, during the corresponding age, the indigenous North European Barbarism ‘stewed in its own juice’; and though the old wine did notably improve by keeping (as it had improved under the same treatment in the same region on other occasions before),³ it was not, as in Ireland, miraculously changed, by a fresh infusion, into a new vintage.

¹ With the exception of the Franks, who were not converted until A.D. 496. This retardation in the conversion of the Franks is noteworthy, but its effect was mitigated by the fact that the Franks had already settled on Roman ground, where they were exposed to all the influences of the Roman Christian culture. Moreover, the Franks were converted to Catholic Christianity direct, instead of passing from paganism to Catholicism through an intermediate stage of Arianism, like the Goths, Vandals, and Lombards.

² For a sketch of this embryonic Far Western Christian Civilization which emerged in Ireland during the segregation period, see pp. 324–8, above.

³ Before the abortive attempt at creating a Scandinavian Civilization, and the consequent absorption of Scandinavia into Western Christendom, between the eighth and the eleventh century of the Christian Era, the North European Barbarism had had a long history in Scandinavia; and there is one feature in its history here which is distinctive and recurrent because it arises from the permanent geographical relation of Scandinavia to the Continent. On a sociological view, Scandinavia has always been virtually an island, since the cultural radiation to which it has been subject has always travelled to Scandinavia across Continental Europe and thence, in the last stage of the journey, over the Baltic or the North Sea; and this sociological insularity has made Scandinavia particularly prone to segregation. Accordingly, during the long age of Barbarism, during which the Primitive Savagery of Northern Europe was being irradiated by the several contemporary or successive influences of the Egyptian and Minoan and Sumeric and Hittite and Hellenic and Syriac civilizations, it frequently happened that some particular element or aspect or phase or emanation of one or other of these incoming cultures remained in being, within the secluded area of Scandinavia, and underwent new local developments there, long after it had become obsolete, not only in the focus of the civilization which had originally created it, but even in the intermediate zones of barbarism across which the cultural radiation had passed *en route* to Scandinavia from its point of origin. This peculiarity of Scandinavian cultural history in the age of barbarism becomes apparent at

'The Northman, cut off from association with the outside world, turned his attention inward. . . . In certain respects he became a barbarian again. The stately chieftain in his Romanized garb was transformed back into a long-bearded viking; his Damascene blade was replaced by a heavy sword of iron or a 'troll' of a battle-axe; he wished not to be buried in a coffin in the Southern fashion, but again piled up a mound of earth over the dead, as did his ancient forefathers. He was like the legendary hero Sinfjötli, who when ten years old was sent out into the forest to live as a wolf in order that he might be hardened for the great deed that awaited him. In the same manner the Northman was thrown back upon his own rude nature. He tried his strength against the sea, hunted seals and whales, caught small fish and large fish, went up on the mountain heights after reindeer or after Lapp tribute, or cleared his forest—and dreamed his long heavy winter dream.'¹

There was a deep difference here, in life and in outlook, between Scandinavia and Ireland in the segregation-period; and this difference, at this stage, produced a further differentiation between the courses of Scandinavian and of Irish history in the following stage, when the Irish and the Scandinavians successively re-entered into contact with Continental Roman Christendom. This subsequent and consequent differentiation was threefold. In the first place, the Scandinavians did not begin to develop a positive civilization of their own until after they had re-established contact with Roman Christendom, whereas the emergence of an embryonic Far Western Christian Civilization in Ireland had preceded the re-establishment of contact between the Irish and the Roman Church. In the second place, the re-establishment of contact between the Scandinavians and Roman Christendom was made on Frankish and not on Scandinavian initiative. Charlemagne's thirty years' war of attrition against the Continental Saxons (A.D. 772-804), in which the Continental frontier of Roman Christendom against the North European Barbarism was carried forward overland from the Ruhr to the Eider, both anticipated² and precipitated³ the Scandinavian sea-raids upon

a glance to any one who visits the Museum of National Antiquities in Stockholm. The visitor cannot fail to observe that the Swedish relics, here displayed, of the North European 'Stone Age' and 'Bronze Age' and 'Iron Age' are the finest local relics of these successive phases of the North European Barbarism that are anywhere to be seen. At first thoughts, it seems paradoxical that the finest products of a culture should have been produced on the outermost fringe of the culture's geographical range; but second thoughts discern that the geographical remoteness of Scandinavia is precisely the explanation of its technological pre-eminence, when the factors of segregation and 'time-lag' are taken into account. The barbarians of Scandinavia eventually carried the techniques of 'the Stone Age' and 'the Bronze Age' to higher degrees of excellence than were ever achieved in either technique by the barbarians of the Continent for the simple reason that the Scandinavians, segregated in their *alter orbis*, were continuing to work in stone for many centuries after the Continentals had abandoned stone for bronze and thereafter to work in bronze (when once they had adopted it) after the Continentals had taken to iron.

¹ Olrik, *op. cit.*, pp. 9-10.

² The earliest recorded Scandinavian sea-raids upon Western Christendom took place some time between the years 786 and 793. (Kendrick, T. D.: *A History of the Vikings* (London 1930, Methuen), pp. 3-4.)

³ See II. D (iii), pp. 86-7, above.

the coasts of Gaul and the British Isles. On the other hand, in the re-establishment of contact, two centuries earlier, between the Irish and the Roman Church, Roman Augustine's landing in Britain had at least been forestalled, even if it cannot be shown to have been inspired, by Irish Columbanus's landing on the Continent. The third line of differentiation between Scandinavian and Irish history, which is inherent in the other two, is perhaps the most important. The collision between the Irish and the Roman Church was pacific; the collision between the Scandinavians and Western Christendom was a clash of arms.

The Scandinavian *Völkerwanderung*, like other *Völkerwanderungen*, was the reaction of a barbarian society to the impact of a civilization.¹ The post-Hellenic *Völkerwanderung*, which had drawn the Scandinavians' Continental Teutonic kinsmen into its vortex and had left the Scandinavian rear-guard stranded, had been a long-term reaction to the Transalpine expansion of the Roman Empire. The Scandinavian *Völkerwanderung* which followed in course of time, some four centuries later, was a short-term reaction to the abortive evocation of a ghost of the Roman Empire by Charlemagne and the Carolingian epigoni.² The Carolingian Empire was a fiasco because it was both grandiose and premature. It was an ambitious political super-structure piled up recklessly upon rudimentary social and economic foundations;³ and the arch-instance of its unsoundness was the *tour de force* of Charlemagne's conquest of Saxony, which brought the Carolingian Empire and Scandinavia into direct contact with one another.

During the two preceding centuries, when Scandinavia had been segregated from Roman Christendom, Continental Saxony had acted as a kind of buffer or middle term between the Scandinavian peoples and the Frankish 'successor-state' of the Roman Empire. The people of Saxony, during this period, had certain affinities with the peoples both north and south of them. They were related equally to Franks and to Scandinavians inasmuch as all three peoples were Teutons. At the same time, the people of Saxony were especially akin to the Scandinavians inasmuch as the ruling elements among them had originally come from the North during the post-Hellenic *Völkerwanderung*, when they had turned their faces towards the Continent and had conquered their fellow barbarians between the Eider and the Ruhr, instead of turning their faces towards the sea like their kinsmen and namesakes who conquered Britain. Like the Scandinavians, again, these Continental

¹ The nature and geneses of *Völkerwanderungen* are examined further in Part VIII, below.

² See II. D (iii), pp. 86-7, above.

³ The weakness of the Carolingian Empire is examined further in Part X, below.

Saxon conquerors and their indigenous Teutonic subjects had remained faithful to their primitive Teutonic paganism when both the Franks and the transmarine Saxons had become converts to Roman Christianity. On the other hand, the subject element in Saxony was partly Frankish in origin and spoke a kindred Teutonic dialect which the Saxon conquerors themselves adopted. Thus Saxony, before Charlemagne's war, was a potential bridge between Roman Christendom and Scandinavia: a bridge over which some successor of Boniface might have led the Scandinavians into the fold of Roman Christendom by the great missionary's pacific methods. Charlemagne's militancy ruled out this possibility.

When Charlemagne set out in A.D. 772 to bring Saxony within the fold of Roman Christendom by force of arms, he was making a disastrous breach with the policy of peaceful penetration—conducted by Irish and English missionaries on the Continent for a century past—which had effectively extended the borders of Continental Christendom at the expense of the Continental Barbarism by achieving the conversion of the Bavarians and Thuringians and Hessians and Frisians.¹ And this change of policy was not only morally retrograde; it was even militarily disastrous; for though the *tour de force* of a Frankish conquest of Saxony was eventually achieved, it was a Pyrrhic victory. The ordeal of the Franco-Saxon Thirty Years' War overtaxed the limited resources of the Carolingian Empire and overstrained the weak tissues of the nascent Western Society which had been burdened with this ponderous unitary political régime. By the time when the Carolingian offensive had been carried to the line of the Eider, its force was spent; the rash advance stopped dead; and it was inevitably and immediately followed by a counter-attack in which the Scandinavians—awaking, full of vigour, from their 'heavy winter dream'—avenged upon the exhausted Franks the wrongs of the prostrated Saxons. In fact, the convulsive expansion of the Frankish Power over the basins of the Weser and the Elbe, which came to this abrupt halt at the neck of the Danish Peninsula, aroused in the souls of the Scandinavians the same demoniac *furor barbaricus*—the notorious Berserker² rage—that had once been awakened in the souls of the Celts when the ambitious expansion of the Etruscan Power over the Basin of the Po had come to a halt at the foot of the Alps.³

¹ See p. 336, above.

² Berserkers, i.e. warriors who went into battle without defensive armour, were an institution of the North European Barbarism which was not confined to the Scandinavian Barbarism of the Viking Age. There were Celtic Berserkers in Transalpine Gaul in the third century B.C. The Transalpine Celtic mercenaries (Gaesatae) whom the Cisalpine Celts enlisted when they made their supreme effort to break the power of Rome, fought naked at the Battle of Telamon in 225 B.C. (See Polybius, Bk. II, chs. 22, 28, and 30.)

³ For the relation between the Etruscan expansion and the Celtic avalanche, see pp. 276 and 280, above.

'In its origin and driving force, the' Scandinavian, like the Celtic, 'movement was a tremendous expansion of the life-force of the race';¹ and the Scandinavian expansion in the eighth to eleventh centuries of the Christian Era surpassed the Celtic expansion of the fifth to third centuries B.C. both in extension and in intensity: in the impetus of its attack; in the sweep of its geographical range; in the narrowness of the margin by which it just failed to overwhelm the civilization against which it was directed; and in the brilliance of the embryonic civilization which it created on its own account. The abortive envelopment of the Hellenic World by the Celts, which had carried the right wing of the North European barbarian assailants of Hellenism into the heart of Spain and their left into the heart of Asia Minor,² was dwarfed in geographical scale by the operations of the Vikings, who threatened to envelop Orthodox as well as Western Christendom by extending their left wing into Russia and their right into North America. Again, the two Christian civilizations which were assaulted by the Scandinavians were in greater jeopardy when the Vikings were attempting to force the passages of the Seine and the Thames and the Bosphorus past Paris and London³ and Constantinople, than the jeopardy in which the Hellenic Civilization found itself at the moments when the Celtic war-bands were actually masters of Rome and of Macedonia.⁴ In a still higher degree, the abortive Scandinavian Civilization which began to unfold itself in Iceland before its chill beauty melted into formlessness under the warm breath of Christianity, surpassed in both achievement and in promise the rudimentary Celtic culture of La Tène.⁵

We have already observed that the short bloom of the Scandinavian Civilization in Iceland was evoked by the same stimulus as the long bloom of the Hellenic Civilization in Ionia: the peculiar stimulus which is given to barbarians by a *Völkerwanderung* which carries them overseas. We have taken a comparative view of the Icelandic and the Ionian achievements in the two fields of political organization and literary art;⁶ and it would be superfluous at this point to enlarge upon the character of the abortive Scandinavian Civilization, and its resemblance to the successful Hellenic Civilization, any farther.⁷ We may likewise absolve ourselves from recapitulating the account which we have already given of the Scandinavian assault upon Western Christendom and its ultimate failure.⁸

¹ Olrik, *op. cit.*, p. 97.

² See pp. 280-1, above.

We may pass on at once to consider the successive consequences of this failure as far as they concern Scandinavia.

The first of these consequences was that the Scandinavian invaders who had made a forcible lodgement on the soil of Western Christendom, in the Danelaw and in Normandy, were at once lost to the Scandinavian Society, as irrevocably as if they had been annihilated, through their rapid conversion to the religion and culture of their invincible Western Christian adversaries. The enlistment of the converted Normans as knights errant in Western Christendom's service was the first signal piece of evidence which showed that, in this encounter, Western Christendom and not Scandinavia was the victor. We have noticed this metamorphosis of the Normans already;¹ but this was only the first stage in the Christian counter-attack. In the second and final stage, both the Western and the Orthodox Christian Society carried the war, which they had already won on their own ground, into the enemy's country, and rendered the nascent Scandinavian Civilization abortive by conquering the whole vast extent of the New World in the North which Scandinavian enterprise had called into existence.²

It is noteworthy that these successive triumphs of Western Christendom over Scandinavia were obtained by a reversion to the tactics which Charlemagne had discarded. The self-defence of Western Christendom against the Vikings' assaults had been conducted, perforce, on the militant lines on which Charlemagne had rashly embarked and on which the Scandinavians had followed Charlemagne's lead with a vengeance. But as soon as a militant Western defensive had brought the militant Scandinavian offensive to a halt, the Westerners resumed the peaceful tactics of Augustine, and Boniface, which Charlemagne had abandoned with such disastrous consequences. One hundred and seven years after the end of Charlemagne's Great Saxon War, a Charles who was nicknamed 'the Simple' was able at last to set bounds to the mischief which had been done by Charles 'the Great' by making another new departure in policy—this time in exactly the opposite direction from that which had been taken by his more famous namesake and ancestor. In the treaty concluded in A.D. 911 between the Carolingian Charles the Simple and the Viking Rollo, the barbarian intruder was permitted to retain in peace his conquests on Frankish soil—from which the lawful Frankish sovereign would scarcely have been able to eject him by force—on condition that he enrolled himself as a citizen of the Western *Respublica Christiana*; and the sequel proved that the Carolingian statesman who made this compact had been right in believing that he was getting the best of the

¹ In II. D (v), on p. 201, above.

² See II. D (v), pp. 201-2, above.

bargain. This resumption of the policy of peaceful penetration in place of the policy of force in dealing with the Northern barbarians was accountable for all the subsequent successes of Western Christendom in the encounter between the two societies. By peaceful penetration, Western Christendom converted not only the impulsive Normans, who had forced an entry and made a lodgement as formidable strangers within her gates, but also the warier Northmen who had remained ensconced on their own ground in the North European hinterland beyond the pale at which the frontier of the Carolingian Empire had been fixed by Charlemagne's Saxon campaigns.

The tactics of peaceful penetration proved particularly effective in dealing with the Scandinavians because the Scandinavians were peculiarly receptive. The Scandinavians had already shown themselves susceptible to the influence of the embryonic Far Western Christian Civilization of Ireland¹ at a time when their relations with Roman Christendom and with the Carolingian Empire were still exclusively hostile. This Irish influence enriched and did not sterilize the native vein of the Scandinavian genius, because the embryonic Irish and Scandinavian civilizations had an identic source in the common reservoir of the traditional North European Barbarism, while the new Christian element, of which the nascent Scandinavian Civilization received its first infusion through this Irish channel, had already been blended harmoniously with a North European tincture in the course of its percolation through Irish soil.² Thus, when the Vikings overwhelmed Ireland, they plundered the spiritual as well as the material riches of their Irish victims with impunity.³ On the other hand, when they descended upon Roman Christendom and eventually succumbed to the spell of a civilization which had succeeded in holding them at bay, they ate the bread and drank the cup of the Christian mysteries without that saving self-examination which Paul had recommended to the Corinthians and which the Delphic Apollo, long before Paul's day, had enjoined upon all Hellenes who presumed to approach a shrine

¹ For Irish influence on the Scandinavian Civilization see Olrik, *op. cit.*, pp. 107-20; and Macalister, R. A. S.: *The Archaeology of Ireland* (London 1928, Methuen), pp. 340-3.

² For this harmonious adaptation of Christianity in Ireland to the temper of the pre-existing local culture, see pp. 322 and 324-8, above.

³ The effect of the Irish influence upon Scandinavian culture is summed up by Olrik (in *op. cit.*, p. 120) as follows:

'Considered as a whole, this Irish element in Scandinavian culture is a phenomenon in itself, which does not coincide with the principal current of the Christian movement as it passes over Europe. It appears more as an enrichment and expansion of the native North European stage of Civilization than as a part of the new trend accompanying the introduction of Christianity. In so far as it swept away a portion of the ancient heritage, this tendency might have made a breach for the entrance of the new main current; and furthermore certain Christian impulses did emanate from Ireland. But in at least equal measure this Irish influence contributed to the production of a special civilization which somewhat impeded the rapid absorption of the North into Christian Europe.'

once consecrated to older Minoan divinities whom the intrusive Olympian had supplanted. In thus swallowing Roman Christianity whole, the Scandinavians were eating and drinking damnation to themselves.¹ The strong wine of the South tainted and sterilized the elixir of Scandinavian culture and burst the bottles of the North European Barbarism within which this elixir was being gradually distilled.

The encounter between the Scandinavians and Orthodox Christendom followed a parallel course; for, although Orthodox Christendom had borne no share in the responsibility for evoking the Scandinavian outbreak, it suffered incidentally from the consequences of the militant Western Christian offensive against the North European Barbarism in the generation of Charlemagne. The Scandinavian movement of expansion threatened to overwhelm both the Roman and the Orthodox Christian World simultaneously. While the Vikings who had taken to the North Sea sailed up the Thames to sack London in A.D. 842 and up the Seine to sack Paris in 845, other Vikings, who had taken to the Baltic and had threaded their way, by river and portage, across the whole breadth of Russia until they emerged on the Black Sea, sailed down the Bosphorus in A.D. 860 to sack Constantinople and only just failed to take the Imperial City by surprise. Thereafter, Constantinople, like Paris and London, endured and survived the ordeal of successive Scandinavian assaults;² and in the great war of A.D. 967-72 the East Roman Government first incited the Scandinavian prince of Russia, Svyatoslav, to invade the rival Orthodox Christian Empire of Bulgaria overland, and finally drove the formidable barbarian intruder out again, without being forced to concede to him, on Orthodox Christian soil, the equivalent of a Danelaw or a Normandy. The sequel to the treaty which Svyatoslav found himself compelled to conclude with the East Roman Emperor John Zimisces at Drstra in A.D. 972 was the same as the sequel to Guthrum's treaty with Alfred in A.D. 878 and to Rollo's with Charles in A.D. 911, except that the discomfiture of the Scandinavian aggressor was more signal on the Orthodox Christian front and his subsequent conversion more rapid.

Thus, when the Vikings made their pacts with the Christian Powers—a Wessex and a France and an East Roman Empire—after having been flung back from the walls of Constantinople and Paris and London, the nascent Scandinavian Civilization was doomed; for nothing but the ferocity of the Northmen could save them from the fate to which their receptivity exposed them. In the collision

¹ 1 Corinthians xii. 29.

For the ordeal of Paris and London, see II. D (v), Annex, on pp. 400-1, below.

between the Scandinavian Völkerwanderung and Christendom, there were only two possible alternative outcomes: either Christendom must be annihilated or the nascent Scandinavian Civilization must be rendered abortive by the conversion of its makers. When the former alternative was renounced, the second inevitably came to pass. The frail fabric of the native Scandinavian culture was now disintegrated by a foreign radiation which penetrated it, layer by layer, first on the economic plane and then on the political and finally on the cultural. On the political plane, Charlemagne the heir of Augustus ultimately exercised a more profound effect upon Scandinavian minds than Charlemagne the slayer of the Saxons. On the cultural plane, the process of peaceful penetration was completed when the Northmen accepted the very religion of the Southerners.

'It was the wealth of the South that lured the Viking. . . . But the Northman was an apt pupil; he not only stole; he also imitated. He learnt to build fortresses and form a *testudo*, to imitate the high-prowed warships, the galleys of the South, in his own dragon ships; he learned to plan cities and order a state. A new goal for the ruler's power arose . . . the figure of Charlemagne: "Carolus Magnus". Even during his lifetime, in the families of Northern kings in the West, men began to call their sons Karlus or Magnus; whenever a Magnus subsequently succeeds to one of the Northern royal seats, this is a victory of the Carolus Magnus ideal. A kingship with external power, internal peace and order, and moral elevation, stands as the highest goal of princely ambition.

'As the viking king moves in the direction of the Carolus Magnus ideal, the viking ships are transformed into merchant ships. At the beginning of the Viking Age, they set forth on bloody expeditions; at the end of the Viking Age, Scandinavian merchant towns have arisen along all the coasts of Northern Europe from Novgorod to Bristol, Limerick, and Dublin. The Atlantic Ocean, the North Sea, and the Baltic Sea, formerly bare of ships, have now been absorbed into the realm of world trade. . . . Consciously or unconsciously, the Scandinavians acquire the handicrafts and art of foreign peoples. They adopt a metal currency. . . .

'The acceptance of Christianity was for many persons rather an assimilation of European life than an expression of religious enthusiasm.'¹

The receptivity of the Northmen was indeed as sensitive on the cultural plane as on the economic or political; and here it was not merely imitative but also creative.

'The old idea of the Vikings as sweeping like a storm across the lands they touched, destroying the wealth they found and leaving themselves as poor as ever, has in our time had to give way to a breathless wonder at their craving for enrichment. The gold they found has disappeared. But we have learnt now that there was gathered together in the

¹ Olrik, *op. cit.*, pp. 104-7.

North a treasury of knowledge and thought, poetry and dreams, that must have been brought home from abroad, despite the fact that such spiritual values are far more difficult to find and steal and carry safely home than precious stones or precious metals. The Northmen seem to have been insatiable in the matter of such spiritual treasures. . . . [And] they had not only a passionate craving to convert the elements of foreign culture to their own enrichment, but they had also a mysterious power of stirring up culture and forcing it to yield what lay beneath its surface. Even this thirst for knowledge, however, is not the most surprising thing about them. That they did learn and copy to a great extent is plain to see; but . . . there exists no magic formula whereby the culture of Viking times, as a whole, can be resolved into its original component parts. So thoroughly have they refashioned what they took, until its thought and spirit are their own.¹

The audacious attempt to re-cast the Christian culture in a Scandinavian mould was manifestly a forlorn hope. Yet a society which could summon up the spirit and exercise the imagination to essay this *tour de force* would not readily confess itself outmatched. And, although this spiritual encounter could have no other outcome than the assimilation of the weaker spiritual force by the stronger, the nascent Scandinavian Civilization did not reconcile itself to this spiritual discomfiture without a struggle. The spell of quiescence which had given free play to the Scandinavian faculty of receptivity at the turn of the ninth and tenth centuries was broken, before the latter century closed, by a fresh outburst of the *furor barbaricus*; this new fit of Berserker rage was provoked by a recognition of the strange and monstrous fact that the meek were fast inheriting the Scandinavian Earth; and the spirit of militant reaction was embodied, by the Northern poetic imagination of the day, in the heroic figure of Starkad the Old:² a mighty man of valour who, with a fervour worthy of a Syriac prophet, inspires the king his lord to cleanse his household from foreign abominations. In creating the image of this pagan zealot, the Scandinavian Society of the Viking Age was painting a portrait of itself. As he first appears upon the scene, Starkad victoriously repels the formidable oncoming tide of Christian influence; but as the poetic cycle of which Starkad is the hero develops, a tragic *motif* creeps in. In the latest version of the plot, the zealot himself is corrupted by the foreign abominations which he has denounced. For lust of foreign gold, Starkad betrays his master; and when we translate this poetry into prose, the upshot is that the tenth-century reaction was foredoomed to failure, and that the victory of the Christian over the

¹ Grönbech, V.: *The Culture of the Teutons* (London 1931, Milford, 3 parts in 2 vols.), Part I, pp. 11-12.

² For an analysis and interpretation of the Starkad Cycle, see Olrik, *op. cit.*, pp. 120-7.

Scandinavian Civilization was really assured before the tenth century was over.

In the Scandinavian kingdoms of Russia, Denmark, and Norway, the formal outward act of conversion was imposed upon the people wholesale by the arbitrary will of three contemporary princes: Vladimir the Great (*regnabat* A.D. 980-1015), Harald Gormsson (*regnabat circa* A.D. 940-86), and Olaf Tryggvason (*regnabat* A.D. 995-1000). In Norway, strenuous resistance was offered to a royal command which was ostensibly actuated by nothing more reasonable than the determination of a masterful ruler to gratify a personal whim; and in Denmark and in Russia, where the royal commands were passively accepted by the princes' subjects, the princes themselves appeared to be acting on immediate considerations of political expediency. Harald imposed Christianity on Denmark in A.D. 974 as part of the purchase-price of peace from the Saxon emperor Otto II, who had invaded Denmark in force in reprisal for Danish raids on Saxony.¹ Vladimir imposed Christianity on Russia in A.D. 989 in order to win the hand of a Christian princess, the sister of the East Roman Emperor Basil II, and to obtain as her dowry a diplomatic ratification of his seizure of the East Roman fortress of Cherson in the Crimea.²

'At his despotic command, Peroun, the god of thunder, whom he had so long adored, was dragged through the streets of Kiow; and twelve sturdy barbarians battered with clubs the misshapen image, which was indignantly cast into the waters of the Borysthenes. The edict of Wologdomir had proclaimed that all who should refuse the rites of baptism would be treated as the enemies of God and their prince; and the rivers were instantly filled with many thousands of obedient Russians, who acquiesced in the truth and excellence of a doctrine which had been embraced by the great duke and his boyars.'³

Vladimir's fiat may conceivably account for the mass-conversion of the docile Slavs on whom the Scandinavian pioneers in Russia had imposed their dominion. Yet the personal opportunism or caprice of a ruler seldom or never avails to bring about a wholesale and permanent revolution in the religion of his subjects unless the religious change which the ruler enjoins is in accord with the prevalent social tendencies of the place and the time.⁴ This truth is eminently true in a turbulent and individualistic society such as the

¹ Kendrick, T. D.: *A History of the Vikings* (London 1930, Methuen), p. 103.

² Kendrick, *op. cit.*, pp. 164-5.

³ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, ch. lv.

⁴ The history of civilizations up to date furnishes a number of instances of signal failures in cases where rulers have attempted to use their political power for the purpose of enforcing religious changes against the spirit of the place and time. Examples of such failures (e.g., in the cases of Ikhnaton, Ptolemy Soter, Açoka, Julian, Leo Syrus, and Akbar) are examined in V. C (i) (d) 6 (8), Annex, in vol. v, below.

Scandinavian Society was in the Viking Age. The phenomenon that requires to be explained is not the conversion of Vladimir's pagan Slav subjects but rather the conversion of 'his boyars': that is to say, his pagan Swedish war-band; and the readiness of the head-strong Vikings to abandon their primitive paganism for alien religions towards the end of the tenth century of the Christian Era, after kicking, Starkad-wise, against the pricks, was evidently the outcome of a deep and gradual psychological mass-movement with a long rhythm: a movement which statecraft might bring to a head, but which it could not have initiated and could not arrest. The ripeness of the Russian Vikings for conversion in Vladimir's day was not only apparent to Vladimir himself but was also the main-spring of his religious policy, if there is any truth in the story that, before he finally opted for Orthodox Christianity, he investigated and compared the respective merits of Orthodoxy, Romanism, Judaism, and Islam.¹ And the Russian prince's ultimate choice of Orthodox Christianity can probably be accounted for by the fact that, when once the Russian Vikings had failed to take Orthodox Christendom by storm, and when this failure had been followed by a substitution of peaceful for warlike relations between the discomfited barbarians and the civilization which had successfully repelled their assaults, then the attractiveness and prestige of Orthodox Christendom prevailed, in Russian imaginations, over the fainter impressions made upon them by the Roman Christian West or by the Islamic 'Abbasid Caliphate or by Jewish Khazaria.²

'The ambassadors or merchants of Russia compared the idolatry of the woods with the elegant superstition of Constantinople. They had gazed with admiration on the dome of St. Sophia: the lively pictures of saints and martyrs, the riches of the altar, the number and vestments of the priests, the pomp and order of the ceremonies; they were edified by the alternate succession of devout silence and harmonious song; nor was it difficult to persuade them that a choir of angels descended each day from heaven to join in the devotion of the Christians.'³

In general,

'the conversion of the North was accomplished by voluntary means. Of course, we must not assume that compulsion was never used against any individual; the conditions of the times would forbid any such assumption. But no Scandinavian tribe was forced as a body to assume the new law. What happened was that leading men of the tribe appeared in considerable numbers as its advocates, drawing the stragglers in their wake. Behind the many decisions of the *thing* meetings in which the acceptance of Christianity was voted, we cannot always assume the

¹ Kendrick, *op. cit.*, p. 164.

³ Gibbon, *op. cit.*, loc. cit.

presence of a majority, but surely [always] that of a very important minority. And, once the choice had been made, it was never rescinded; we do not encounter any pagan reaction of real moment.¹

The most illuminating instance of all was the conversion of Iceland, and this for several reasons. In the first place, the Scandinavian community in Iceland was particularly remote from Christendom geographically. In the second place, its political constitution and political tradition were both peculiarly individualistic, so that in Iceland it was even less easy than in other Scandinavian countries to impose conversion upon the body-politic by the arbitrary fiat of an individual or even of a strong minority. In the third place, the Icelanders had been so powerfully stimulated by the challenge of migration overseas to a country still harder than their Norwegian homeland that they had raised the Scandinavian culture which they brought with them to higher degrees of aesthetic and intellectual intensity than were ever attained in any other part of the Scandinavian World,² so that, in abandoning paganism for Christianity, they were sacrificing a more precious and more highly appreciated social heritage than any of the other Scandinavian converts (Russians or Swedes or Danes or other Norwegians) were called upon to give up. Yet, in spite of these special obstacles which the Christian propaganda had to overcome in Iceland, the Icelanders' own records of their conversion show plainly that the process was voluntary here as well as in other Scandinavian lands—if the word 'voluntary' may fairly be used to describe a realistic recognition and unenthusiastic acceptance of a social and psychological necessity. The history of the momentous decision which was taken at the *Althing* in the June of A.D. 1000 is recounted as follows in the *Njals Saga*:³

'Both sides went to the Hill of Laws, and each, the Christian men as well as the heathen, took witness, and declared themselves out of the other's laws, and then there was such an uproar on the Hill of Laws that no man could hear the other's voice.

'After that men went away, and all thought things looked like the greatest entanglement. The Christian men chose as their Speaker Hall of the Side, but Hall went to Thorgeir, the priest of Lightwater, who was the old Speaker of the law, and gave him three marks of silver to utter what the law should be, but still that was most hazardous counsel, since he was an heathen.

'Thorgeir lay all that day on the ground, and spread a cloak over his head, so that no man spoke with him; but the day after men went to the

¹ Olrik, *op. cit.*, p. 140.

² On this point, see II. D (iii), pp. 86-100, above.

³ *The Story of Burnt Njal*, translated from the Icelandic of the *Njals Saga* by Dasent, G. W. (Edinburgh 1861, Edmonton and Douglas), vol. ii, pp. 78-80. See further Kendrick, *op. cit.*, pp. 346-53.

Hill of Laws, and then Thorgeir bade them be silent and listen, and spoke thus—

"It seems to me as though our matters were come to a deadlock if we are not all to have one and the same law; for if there be a sundering of the laws, then there will be a sundering of the peace, and we shall never be able to live in the land. Now, I will ask both Christian man and heathen whether they will hold to those laws which I utter?"

"They all said they would.

"He said he wished to take an oath of them, and pledges that they would hold to them, and they all said "yea" to that, and so he took pledges from them.

"This is the beginning of our laws", he said, "that all men shall be Christian here in the land, and believe in one God, the Father, the Son, and the Holy Ghost, but leave off all idol-worship, not expose children to perish and not eat horseflesh. It shall be outlawry if such things are proved openly against any man; but if these things are done by stealth, then it shall be blameless."

"But all this heathendom was all done away with within a few years' space, so that those things were not allowed to be done either by stealth or openly.

"Thorgeir then uttered the law as to keeping the Lord's day and fast days, Yuletide and Easter, and all the greatest highdays and holidays.

"The heathen men thought they had been greatly cheated; but still the True Faith was brought into the law, and so all men became Christian here in the land."

It was here in Iceland, where the act of conversion was influenced by external pressure to a lesser extent than anywhere else in the Scandinavian World, that the cultural consequences of conversion were most manifestly devastating. This spiritual devastation is conspicuous in this case for the reason, mentioned above, that the Icelanders, before their conversion, had raised the abortive Scandinavian Civilization to its highest level of achievement, and for the further reason that the Scandinavian culture, as maintained in Iceland at this high pitch, differed markedly in many respects, and in most of these respects to its own advantage, from the contemporary culture of Roman Christendom.

While the Roman, like the Orthodox Christian, Civilization was affiliated through the Christian Church to an antecedent civilization, and was only less potently dominated by the Hellenic past than was Orthodox Christendom itself, the relation of the abortive Scandinavian Civilization to the defunct and contemporary civilizations of the South resembled rather the less intimate relation that had once subsisted between the Hellenic Civilization and the Minoan. The barbarian Vikings, like the barbarian Achaeans, were at first stimulated by their contact with the Southern cultures to create an original culture of their own rather than to bow down and worship

the established civilizations which they encountered; and this similarity between the Scandinavian and the Achaean reaction to alien societies goes far towards accounting for the similarity in *êthos* between the abortive Scandinavian and the successful Hellenic Civilization: a family likeness which is recognized on all hands and is indeed unmistakable.¹

The Scandinavian *êthos* of the Viking and the post-Viking Age, as it is reflected in the Eddic and Skaldic poetry and in the Sagas, resembles the Hellenic *êthos* of the Heroic and the Early Classical Age, as it is reflected in the Homeric Epic and in the prose of Herodotus. Both these young civilizations are distinguished by a freedom from the incubus of tradition, which gives them a precocious freshness and originality, and by a freedom from the incubus of superstition, which gives them a precocious clarity and rationalism. Their members are fully aware both of the extent of their human powers and of these powers' limitations; and this ever-present dual consciousness results in a combination of self-confidence with pessimism and of exaltation with melancholy, which is often puzzling, and always intriguing, to observers who have grown up in other spiritual environments.

In the Viking Movement, as in the Achaean *Völkerwanderung*, the

'presupposition was a people not only acquainted with maritime affairs, but possessing courage to venture forth, ability to make far-reaching plans, and a gift for keen observation, always ready to find the adversary's weak points. These powers seemed to grow with the increase of their tasks and the broadening of their horizon. Taken together, they produced a feeling of superiority and invincibility. The compass of the World was multiplied many times. The shut-in valley-dweller had felt the world of trolls and monsters, whom Man might not tempt, to be close at hand. The boundaries of this world now widened immensely, and the viking pursued his horizon, directing his course over the sea though the keel of his boat might break the back of a mermaid, or ascending to the Cave of the Giants in the farthest north to see whether this adventure was really so dangerous. It is true, the ancient terror remained in his soul, imparting the proper tension for the audacious venture; but at the same time his inborn self-assurance and matter-of-factness grew into a conscious emphasis on the tangible and reasonable, into that "faith in their own power and strength" which the vikings professed—in spite of all gods and trolls and mighty realms.'²

This *êthos* which was tempered in adventurous action found expression in literary art.

'The Sagas are partly indebted to a spirit of negative criticism and

¹ See Annex V, below, for the resemblance in the field of religion.

² Olrik, *op. cit.*, pp. 97-8.

restraint: a tendency not purely literary—corresponding, at any rate, to a similar tendency in practical life. The energy, the passion, the lamentation of the Northern poetry, the love of all the wonders of Mythology, went along with practical and intellectual clearness of vision in matters that required cool judgement. The ironical correction of sentiment, the tone of the *advocatus diaboli*, is habitual with many of the Icelandic writers, and many of their heroes. "To see things as they really are", so that no incantation could transform them, was one of the gifts of an Icelandic hero, and appears to have been shared by his countrymen when they set themselves to compose the Sagas. The tone of the Sagas is generally kept as near as may be to that of the recital of true history. Nothing is allowed any preponderance over the story and the speeches in it. It is the kind of story furthest removed from the common pathetic fallacies of the Middle Ages. The rationalist mind has cleared away all the sentimental and most of the superstitious encumbrances and hindrances of strong narrative.¹

This original Scandinavian *êthos*, which attained its highest tension and finest harmony in Iceland, was relaxed and confused and eventually annihilated in consequence of the conversion of the Icelanders to Christianity.

It is true that the abortive Scandinavian Civilization did not perish without a struggle on this remote island which had been the theatre of its greatest achievements. Indeed, the Icelandic scholars who committed the Sagas to writing and collected the Eddic poems and made the classic digests of Scandinavian Mythology and Genealogy and Law, were all possessed of a Christian as well as a Northern cultural background and education; and the century during which they flourished (*circa* A.D. 1150–1250) was some hundred and fifty to two hundred and fifty years posterior to the date of the conversion.² Yet this backward-looking scholarship was the last achievement of the Icelandic genius; and it is significant that, although the Sagas acquired their final literary form in 'the age of peace' (which intervened between the act of conversion and the age of faction and scholarship), nevertheless 'the age of the Sagas', in the sense of the age from which the historical plots and historical characters of the Sagas were exclusively drawn, did not extend beyond about A.D. 1030: that is to say, beyond the deaths of the generation which was already in its prime by the time when the conversion to Christianity took place. Lives that had come to their maturity in the pre-Christian social environment and atmosphere were apparently the only stuff out of which Icelandic sagas

¹ Ker, W. P.: *Epic and Romance* (London 1922, Macmillan), p. 212.

² On the political plane, this last century of Icelandic intellectual activity was also the last century of the free Icelandic Commonwealth. Snorri Sturlason, the prince of Icelandic scholars, who lived from A.D. 1178 to A.D. 1241, was also a politician who met a violent death in the last political convulsions of the Commonwealth, which ended in the submission of the Icelanders to the Norwegian Crown in A.D. 1262.

could be made. Icelanders who had sucked in the Christian tradition with their mothers' milk might be the collectors or even the composers, but they could never be the heroes, of these essentially pagan works of art. For the heroic Northern self-confidence could not dwell harmoniously in the same heart with the Christian conviction of sin, nor the stoical Northern rationalism in the same mind with Christian sentiment and Christian superstition.

As the alien civilization to which the Icelanders had capitulated in A.D. 1000 gradually establishes its dominion over their hearts and minds,

'a mysterious fantasy, pregnant with disaster, comes into being and carries off the victory over the ancient worldly wisdom and the poet's sense of proportion. In the bitter years of the Sturlung conflicts, about the middle of the thirteenth century, the fear in people's souls expresses itself constantly in visions and dreams. Elements that had once been subject to poetic domination now gradually gain the upper hand. The downfall of the Icelandic Free State brings about also a cessation of the national Saga literature. Preference is shown for the romantic saga, to which the cultivated aesthetic sense is now turned; its fantastic elements become stronger and stronger and digress farther and farther from reality. The nation that once had so sharp an eye for the world of reality falls into slumber—politically, aesthetically, economically—and sleeps its sleep of centuries, full of disturbing dreams, while the elves shriek their shrill laughter from all the cliffs and the giants from all the rocky caves, while the Earth quakes, and the fire-mountains shine, and souls fly about the crater of Hekla like black birds.'¹

By the fourteenth century of the Christian Era, the Icelandic *Kulturkampf* is over and the paralysis of the Icelandic genius is complete. The clear light of the pale Northern sunshine has now been refracted through the exotic medium of a stained-glass window; and the Icelandic mental landscape, thus weirdly illuminated, has become stupefyingly outlandish.

'Hauk Erlendsson, an Icelander of distinction in the fourteenth century, made a collection of treatises in one volume for his own amusement and behoof. It contains the *Volosþá*, the most famous of all the Northern mythical poems, the Sibyl's song of the doom of the gods; it contains also the *Landnámabók*, the history of the colonization of Iceland; *Kristni Saga*, the history of the conversion to Christianity; the history of *Eric the Red*, and *Fóstbræðra Saga*, the story of the two sworn brethren, Thorgeir and Thormod the poet. Besides these records of the history and the family traditions of Iceland and Greenland there are some mythical stories of later date, dealing with old mythical themes, such as the life of Ragnar Lodbrok. In one of them, the *Heidreks Saga*, are embedded some of the most memorable verses, after *Volosþá*, in the

¹ Olrik, *op. cit.*, p. 192.

old style of Northern poetry—the poem of the *Waking of Angantyr*. The other contents of the book are as follows: geographical, physical, and theological pieces; extracts from St. Augustine; the *History of the Cross*; the *Description of Jerusalem*; the *Debate of Body and Soul*; *Algorismus* (by Hauk himself, who was an arithmetician); a version of the *Brut* and of *Merlin's Prophecy*; *Lucidarium*, the most popular medieval handbook of popular science. This is the collection, to which all the ends of the Earth have contributed, and it is in strange and far-fetched company like this that the Northern documents are found. In Greece, whatever early transactions there may have been with the wisdom of Egypt or Phoenicia, there is no such medley as this.¹

The century in which Hauk Erlendsson's mental vision was confounded, and his mental abilities paralysed, by this criss-cross of broken intellectual lights was the tenth century since the Scandinavian rear-guard of the Teutonic line (in the embattled army of the North European Barbarism) had struck out on an independent course of its own by parting company with the Teutonic van-guard at a moment when Goths and Vandals and Angles and Lombards had allowed themselves to be drawn, to their own eventual undoing, into the social vacuum produced by the break-up of the Roman Empire. During this millennium, the whole drama of an abortive Scandinavian Civilization had been played out from the first act to the last. After cultivating their native barbarism in their native fastness for some four centuries after their kinsmen and former neighbours had struck their tents and moved off westward and southward, the Scandinavians had been stimulated at last, by Charlemagne's challenge, to break out in their turn; and then, in their Viking Age, they had made a supreme effort to overwhelm the civilizations of the South which they encountered on their war-path, and to establish in their stead a new Scandinavian Civilization erected on barbarian foundations and unencumbered by reminiscences of a traditional style or by traces of a traditional ground-plan. By the fourteenth century of the Christian Era—the century in which Hauk Erlendsson lived—this ambitious Scandinavian enterprise had lamentably miscarried. That century saw the extirpation of the North European Barbarism finally consummated by the establishment of continuous contact between the Western Christian and the Orthodox Christian Civilization along a line stretching across the whole breadth of the European Continent from the coast of the Adriatic Sea to the coast of the Arctic Ocean;² and this new line of demarcation cut sheer across the domain which the abortive Scandinavian Civilization had once staked out for itself. By the fourteenth century, the *ci-devant* Scandinavian dominion in

¹ Ker, W. P.: *Epic and Romance* (London 1922, Macmillan), pp. 47–8.

² See II. D (v), pp. 168–9, above.

Russia had become incorporated into Orthodox Christendom, while Western Christendom had annexed Scandinavia itself with its overseas outposts in the Orkneys and Shetlands and Hebrides and Faroes and Ireland and Iceland and Greenland. The partition of the Scandinavian World between two alien civilizations was thus complete.

We are now in a position to arrange the encounters between the North European Barbarism and the Southern Civilizations in a series, and to embrace them all in a single comparative survey.

In the Achaean achievement, the North European Barbarism successfully performed the feat of begetting a new civilization on the site of a pre-existent civilization which had incorporated a layer of the barbarians into its 'external proletariat'. In the Scandinavian and the Irish endeavours, the same barbarism just fell short of repeating the same performance because the challenge from Roman Christendom was just too severe. The excessive severity of the challenge which defeated the Scandinavian and Irish endeavours—and the earlier endeavours of the Teutonic and Celtic van-guards *a fortiori*—proved inimical to success, no less than the deficiency of stimulus which handicapped the secluded Slavs. Thus our sequence of encounters between the North European Barbarism and the several Southern civilizations does display the operation of 'the law of diminishing returns' in the movement of Challenge-and-Response in an instance in which the challenge is presented in the human sphere and not in the physical sphere. Moreover, our examination of the abortive Scandinavian and Far Western Christian civilizations has enabled us to define within quite narrow limits the locus of the point at which 'the law of diminishing returns' comes into play in this sequence of comparable encounters. The point has been located in the narrow interval between the severity of the challenge presented by the Minoan Civilization to the Achaeans—a challenge which is proved, by the resulting genesis of Hellenism, to have been of the optimum degree—and the slightly enhanced severity of the challenge presented by Roman Christendom to the Irish and the Scandinavians: a challenge which is proved to have been excessive by the consequent abortion in which the embryonic Far Western Christian and Scandinavian civilizations both met their fate.

The Impact of Islam upon the Christendoms

Another sequence of challenges in the human sphere in which we can locate with some precision the point at which 'the law of diminishing returns' comes into play is offered by a series of encounters between the Islamic wave of Syriac religion and the pre-

ceding Christian wave, which had been emitted some six hundred years earlier from approximately the same geographical point of departure. Each of these two successive waves travelled outwards in all directions in a circle with an ever expanding circumference but with a constant and identic centre;¹ and the younger Islamic wave, travelling at a six hundred years' time-interval in the older Christian wave's wake, caught up and collided with different portions of the Christian wave in different sectors of the circumference of their common circular field at different moments and with different degrees of violence and with different results.

If we take a comparative view of the several collisions between these two waves in the several sectors of their circular line of contact, we shall at once observe one instance in which a portion of the older Christian wave responded to the challenge of the younger Islamic wave's impact with conspicuous success. When the Islamic wave impinged upon the Roman portion of the Christian wave in the western sector of their common circumference, it was Western Christendom and not Islam that ultimately profited by the encounter.²

The Primitive Muslim Arab conquerors, who burst the bounds of Arabia in A.D. 632, took just a century to push their conquests, round the southern and western shores of the Mediterranean, from the former Arabian frontier of the Roman Empire to the southern bank of the Loire. As early as A.D. 647 they made the first movement to recapture for the Syriac Civilization (whose unconscious and unintentional champions they were) the colonial area in North-West Africa and in the Iberian Peninsula which had been first won from barbarism by Phoenician enterprise and then annexed by Hellenism as the spoils of Rome's victory over Carthage. By A.D. 713, the year which saw the completion of the Arab conquest of the Visigothic 'successor-state' of the Roman Empire in the Peninsula and in Septimania, the Arabs had not only recovered the whole of the former colonial domain of the Syriac Society in the Western Mediterranean but were penetrating into territory which had been originally won from barbarism not by Syriac Tyre and Carthage but by Hellenic Marseilles and Rome; and when 'Abd-ar-Rahmān marched from the Pyrenees to the Loire in A.D. 732, he was breaking ground which Hannibal himself had never trodden.³

¹ For this refraction of Syriac religion, through the impact of Hellenism, into a series of waves emanating successively from an identic geographical centre, see II. D (vi), pp. 234-6, and II. D (vii), pp. 285-8, above, and II. D (vi), Annex, pp. 402-3, below, as well as Part IX.

² For the reaction of Western Christendom to the pressure of the Syriac Civilization, represented by the Primitive Arab Muslim conquerors and the subsequent Arab Caliphs and their 'successor-states', see II. D (v), pp. 202-6, above.

³ See II. D (v), p. 203, above.

The only Syriac conqueror that had preceded the Muslim soldier in his invasion of Gaul was the Christian Church; and in this sector of the expanding circumference of the wave-field of Syriac religion, by the time when the Christian wave was here overtaken by the Islamic, the Christian wave, as we have observed above, had already differentiated itself locally into a specifically Roman Christendom which was struggling to become the chrysalis of a new Western Civilization 'affiliated' to the Hellenic Civilization. The Arab invasion of Gaul in A.D. 732 struck this nascent Roman Christendom at a critical moment, when it had just emerged victorious from its struggle with the Far Western Christendom of 'the Celtic Fringe'¹ and was on the verge of a still more formidable struggle with the Teutonic rear-guard of the North European Barbarism in Scandinavia.² The challenge presented to Roman Christendom by the impact of Islam at this juncture was more severe than any challenge from the North European barbarians that it had to face either before or after.³ Yet, severe though this Islamic challenge to Roman Christendom was, the sequel showed that it was not excessive; for the actual effect of this collision of the Islamic wave with the western portion of the Christian wave was to stimulate Western Christendom over a long period and to a high degree.

The strength of this stimulus is displayed in a whole series of responses. In this year A.D. 732 itself, 'Abd-ar-Rahmān's attack upon the Continental European homeland of Western Christendom was repelled once and for all by Charles Martel. By the turn of the eighth and ninth centuries of the Christian Era, the Continental European border between Western Christendom and Dār-al-Islām had been pushed back from the northern to the southern foot of the Pyrenees.⁴ At the turn of the tenth and eleventh centuries, the Western Christians assumed the offensive against Dār-al-Islām along the whole Mediterranean front, from the Iberian Peninsula to Syria, in the great movement of political and economic expansion which is known as 'the Crusades':⁵ a movement which eventually engulfed Orthodox Christendom as well as Dār-al-Islām. At its furthest extent, this movement carried Western Christian arms down the whole length of the Peninsula and across the Straits of

¹ See pp. 329-40, above.

² See II. D (v), p. 202, above.

⁴ Pepin conquered Septimania from the Arabs in A.D. 755. Charlemagne crossed the Pyrenees in A.D. 778 and succeeded, before his death, in enlarging his Empire by the addition of a Spanish march which included both Barcelona and Pampelona. Thereby a direct contact was established, south of the Pyrenees, between the Carolingian Empire and the remnant of the Visigothic Power which had survived in isolation, for the best part of a century, in the mountain-fastness of Asturia. For the probable fate of the Asturians if the Franks had not delivered their counter-attack against the Arabs, see Annex VIII, p. 447, footnote 4, below.

⁵ In the Western Mediterranean, this movement began a century before the date of 'the First Crusade' in the technical sense of the term.

³ See pp. 344-60, above.

Gibraltar to Ceuta,¹ and from Italy over the stepping-stone of Sicily to the coasts of Tunisia and Tripoli,² and from Europe *outré mer* to Syria, and from Syria across the Euphrates to Edessa and across the Jordan to Kerak and even to the head of the Gulf of 'Aqabah—not to speak of 'the Latin Empire' of Constantinople and the cluster of petty principalities which a host of French and Venetian and Genoese and Catalan adventurers carved out for themselves in the Aegean as a sequel to 'the Fourth Crusade'. On its economic side, the same movement carried Western trade much farther: from the Levant across Egypt to India and from the Black Sea across the Eurasian Steppe to the Far East.³ It is true that most of these deliberate economic and political conquests were ephemeral; but even this ephemeral contact with Dār-al-Islām and with Orthodox Christendom on the economic and political planes was sufficiently intimate to produce cultural effects upon Western life which were not only fruitful but enduring.⁴

Moreover, a portion of the political as well as the cultural conquests was permanent. While the medieval Western principalities and colonies in the Levant were all eventually wrested away out of Western hands and gathered up into the Ottoman Empire, Calabria and Sicily and the Iberian Peninsula were permanently incorporated into Western Christendom; and the incorporation of the Iberian Peninsula had momentous consequences, which we have reviewed already, in the histories of the West and of the World. The Atlantic sea-front of the Peninsula from Lisbon to Cadiz, which the Western Christians conquered from Dār-al-Islām between the middle of the twelfth and the middle of the thirteenth century of the Christian Era, became 'the jumping-off ground' from which the Portuguese and Castilian pioneers of Western overseas expansion launched the Western Civilization upon the open Atlantic and thereby extended its potential domain, at one stroke, from the narrow bounds of Western Europe to all the navigable seas and habitable lands on the face of the globe. It was the spirit aroused in these Western Christian frontiersmen by their triumphant response to Muslim pressure that nerved them to hazard their lives on the apparently illimitable ocean; and it was the impetus acquired in their victorious counter-attack that carried them not only out into the great deep but right across it into new worlds beyond.⁵

Thus the challenge presented to Western Christendom by the

¹ Conquered by the Portuguese in A.D. 1471.

² A number of places on these North African coasts, from Bona to Tripoli inclusive, were held by the Norman Kings of Sicily for a few years in the middle of the twelfth century.

³ See I. B (iv), vol. i, p. 38, above.

⁴ The cultural effects of the contact of Western Christendom with Orthodox Christendom and with Dār-al-Islām in 'the Crusades' are examined in Part IX, below.

⁵ See II. D (v), p. 204, above.

impact of Islam is manifestly proved, by the outcome of the encounter, to have been highly stimulating, which is as much as to say that in this local encounter the challenge was presented in the optimum degree of severity. The west, however, was only one of several sectors of the concentric Christian and Islamic circles in which a collision between the two waves occurred. While Islam was colliding with Roman Christendom on the west, it was also colliding with Orthodox Christendom on the north and with Monophysite Christendom on the south and with Nestorian Christendom on the east. These several portions of Christendom, which were already alienated from one another spiritually before the Islamic wave welled up in the midst of them, were thenceforth also isolated from one another geographically as the Islamic wave, expanding in their wakes, drove them all outwards and asunder. In consequence, each of these fragmentary Christendoms responded to the Islamic challenge separately and independently on its own account, and these several responses to different presentations of an identic challenge can be compared with one another.

If Western Christendom responded to the challenge of Islam with success, that is the only instance of a successful response which this series of encounters will discover to us. In each of the three other encounters between Islam and a local Christendom, the Christian response was a failure; and when we investigate these failures we shall find that they were not all due to one and the same cause. The encounter between Islam and Monophysitism offers an example of a response which failed because the local presentation of the challenge was not sufficiently severe. In the encounters between Islam and Orthodoxy and between Islam and Nestorianism, the responses were failures because the severity of the challenge was excessive.

The Monophysite failure is Abyssinia: a Monophysite Christian community which has survived in its African fastness, on the southern periphery of the *ci-devant* Syriac World,¹ to become one of the social curiosities of a latter-day Great Society. This Abyssinian Monophysite Christendom is a curiosity nowadays on two accounts: in the first place on account of its sheer survival here, in almost complete isolation from other Christian communities, during the thirteen centuries that have elapsed since the Primitive Muslim Arabs conquered Egypt in A.D. 639-41;² in the second place on account of its extraordinarily low cultural level. 'The common

¹ For this Abyssinian fastness, see II. D (vi), p. 258, above, and II. D (vi), Annex, pp. 403-7, below.

² The antecedent conversion of Abyssinia to a still undifferentiated Christianity had taken place in the fourth century of the Christian Era; the conversion to the Monophysite differentiation of Christianity dates from the latter part of the fifth and early part of the sixth century.

Christianity' of Abyssinia and the West, in a world which the radiation of our Western Christian Civilization has now unified upon a Western basis, is a theme for satire to which only a Voltaire or a Gibbon could do justice. Though Christian Abyssinia has been admitted, with some heart-searching and hesitation, to membership in the League of Nations,¹ she is a byword for disorder and barbarity: the disorder of feudal and tribal anarchy and the barbarity of the slave-trade. In fact, the spectacle presented by the one indigenous African state that has succeeded in retaining its complete independence is perhaps the best justification that can be found for the partition of the rest of Africa among the European Powers.²

Consideration shows that the peculiarities of modern Abyssinia—the survival of her political independence in the midst of an Africa under European dominion, the survival of her Monophysite Christianity in the borderland between Islam and paganism, the survival of her Semitic language between the Hamitic and Nilotic language-areas, and the stagnation of her culture at a level which is really not much higher than the level of the adjacent Tropical African Barbarism—are all peculiarities which derive from the same cause: that is, from the virtual impregnability of the highland-fastness in which this Monophysite fossil is ensconced.

This is the explanation of Abyssinian survival-power. Each casual piece of jetsam that has been left stranded on this rock by the passage of successive waves of civilization has remained high and dry beyond the reach of the waves that have followed.³ A Semitic language has mounted the plateau without succeeding in extinguishing the Hamitic languages which preceded it; a Monophysite Christianity has mounted without succeeding in extinguishing the antecedent Judaism.⁴ The wave of Islam, and the mightier wave of our modern Western Civilization, have washed round the foot of the escarpment without submerging the summit.

The occasions on which these later waves have swept up on to the highlands have been few and brief; and they are the exceptions which prove the prevailing rule of Abyssinian immunity. Abyssinia was in danger of Muslim conquest during the first half of the sixteenth century of the Christian Era when the Muslim inhabitants of the adjoining lowlands along the coasts of the Red Sea and the

¹ For the circumstances of her admission, see Toynbee, A. J.: *A Survey of International Affairs in 1920-3* (London 1925, Milford), pp. 393-6.

² The only other completely sovereign and independent state in Africa besides Abyssinia in the year 1933 was Liberia: a republic in which a helpless aboriginal Negro majority was being mishandled by a repatriated American Negro minority with an almost Abyssinian brutality.

³ See II. D (vi), Annex, pp. 403-7, below.

⁴ For the Jewish fossil (the Falasha) which is ensconced, in the heart of the Monophysite fossil, among the recesses of Semyen, see II. D (vi), p. 257, above, and Annex, pp. 406-7, below.

Gulf of Aden forestalled the Abyssinians in the acquisition of fire-arms; but the newfangled weapons which the Somalis had acquired from the 'Osmanlis' were acquired by the Abyssinians from the Portuguese a quarter of a century later, just in time to save Abyssinia from destruction.¹ Thereafter, when the Portuguese had served their turn and had begun to make themselves a nuisance by attempting to convert Abyssinian Christendom from Monophysitism to Roman Catholicism, the Western version of Christianity was suppressed and all Westerners—priests and laymen alike—were expelled in the 'thirties' of the seventeenth century, at the moment when the same policy was being carried out against the same intrusive forces in Japan.²

Like contemporary Japan, Abyssinia then retired into a deliberate isolation, which lasted until it was eventually broken by the British military expedition to Magdala in 1868. This was a portent of recurring danger from abroad which corresponded in Abyssinian history to the appearance of Commodore Perry's squadron in Yedo Bay in 1853. For the subsequent 'opening-up of Africa' by European Powers whose weapons had just achieved another sudden advance in deadliness—this time in consequence of the Industrial Revolution—exposed Abyssinia once more, towards the close of the nineteenth century, to the menace of foreign conquest which she had had to face in the sixteenth century. This time the formidably armed invaders were not the local Muslims from the Somali coast but a European nation from overseas, the Italians; but once again Abyssinia was saved from destruction by receiving in the nick of time, from friendly hands, a consignment of the deadly weapons that were being used against her. In 'the eighteen-nineties', the Negus Menelik was supplied with breech-loading rifles by the French, as in 'the sixteen-forties' his predecessor Claudius had been supplied by the Portuguese with matchlocks; and in consequence the Italians suffered as signal and decisive a defeat at Abyssinian hands at Adowa in 1896 as the Muslims had suffered at Woina Dega in 1543.

Thus the only two serious foreign attacks which Abyssinia has had to face during the fifteen or sixteen centuries that have elapsed since her conversion were both repelled too quickly and too decisively to serve as stimulating ordeals. The conversion itself has been both the first and the last stirring event in Abyssinian history;

¹ See Alvarez, Father Fr.: *Narrative of the Portuguese Embassy to Abyssinia, A.D. 1520-7*: English translation = Hakluyt Society Publication, 1st series, No. 64 (London 1881, Hakluyt Society); Castanhoso, M. de, and Bermudez, J.: *The Portuguese Expedition to Abyssinia in 1541*: English translation = Hakluyt Society Publication, 2nd series, No. 10 (London 1902, Hakluyt Society).

² The expulsion of the Portuguese and Spaniards and the suppression of Roman Catholicism were accomplished in Japan between A.D. 1614 and A.D. 1638.

both before and after, uneventfulness has been the rule; and there is a remarkable contrast between the profound and enduring effect that was made on Japanese minds by the naval demonstration of Commodore Perry and the apparent indifference of the Abyssinians to the military operations of Lord Napier of Magdala. If the Abyssinians have reacted so much less vigorously than the Japanese to our modern Western pressure, that is because the stimulus of the human environment is robbed of half its effect on Abyssinian minds by a knowledge, born of long experience, that the physical environment can be relied upon to relieve the inhabitants of the Abyssinian highlands from most of the onus of self-preservation.

This persistent lack of stimulus fully accounts for the lowness of the cultural level at which Abyssinian Christendom stands to-day. This sheltered Christian society could afford to let the salt of Christianity lose its savour—to relapse almost to the pre-Christian level and to remain at that low level in perpetuity—because its survival was almost automatically secured by the impregnability of the physical fastness in which it had barricaded itself. In fact, the backwardness of Monophysite Christendom on the Abyssinian Plateau is due to precisely the same cause as the failure of Primitive Man to create any indigenous civilization in the adjacent forests and savannahs of Tropical Africa.¹

Thus the response of Abyssinian Monophysitism to the challenge of Islam was a failure because this challenge, like all the challenges with which the Abyssinians have ever been confronted, was mitigated, to a point far below the optimum degree of severity, by the impregnability of the local physical environment. On the other hand, the responses of Anatolian Orthodoxy and Transoxanian Nestorianism to the Islamic challenge were failures for just the opposite reason.

While the wave of Islamic expansion impinged upon Western Christendom in Gaul with stimulating vigour and washed ineffectively round the impregnable fastness of Monophysitism in Abyssinia, it broke upon Orthodox Christendom in Anatolia with almost overwhelming force. Whereas Transpyrenaean Europe was almost out of range of the Muslim Arab Power with its capital at Damascus and its reservoir of soldiers in Arabia,² Transtauric Asia Minor was within easy striking distance; and for some three centuries, from the launching of the original Arab offensive in A.D. 632 until the break-up of the 'Abbasid Caliphate in the tenth century of the Christian Era, the Arab military efforts which were concentrated

¹ For the non-emergence, up to date, of any indigenous civilization in Tropical Africa, see II. C (ii) (a) 1, vol. i, pp. 233-8, and II. C (ii) (b) 2, vol. i, pp. 312-15, above.

² See Annex IV, below.

upon this Anatolian front were considerably greater than the contemporary efforts which resulted in more spectacular conquests on other fronts. In the first phase, the Arabs sought to put 'Rûm' out of action and to overwhelm Orthodox Christendom altogether by striking, right across Anatolia, at the Imperial City itself; and they came within an ace of attaining this ambitious objective when they besieged Constantinople in A.D. 673-7 and again in A.D. 717-18. Even after the failure of the second siege, when the frontier between Rûm and Dâr-al-Islâm settled down along a more or less stable line coinciding with the physical barrier of the Taurus Range, the surviving Anatolian domain of Orthodox Christendom was regularly raided by the Muslims twice a year, in spring and in autumn, from their *place d'armes* in the Cilician plain at Tarsus.¹

Thus Orthodox Christendom had to resist a pressure from Islam which was distinctly more severe than the pressure from the same force to which Western Christendom was exposed, and infinitely more severe than any Islamic pressure upon Monophysite Abyssinia. The Orthodox Christians responded to this pressure by a political expedient; and this response was successful inasmuch as it availed to keep the Arabs at bay. On the other hand, it was unsuccessful inasmuch as the expedient adopted for this specific purpose had far-reaching effects, which were almost wholly pernicious, upon the inward life and growth of the Orthodox Christian Society: effects which caused the Orthodox Christian Civilization, after a brief spell of illusory power and prosperity, to break down and go into disintegration in the latter part of the tenth century of the Christian Era, just at the time when the sister civilization of Western Christendom was surmounting its early difficulties and entering upon that course of almost uninterrupted progress which has carried it to the pinnacle on which it stands to-day.

The political expedient which Arab Muslim pressure impelled Orthodox Christendom to adopt was the evocation of a 'ghost' of the Roman Empire: a feat which was achieved effectively, and therefore disastrously, in the Orthodox Christian World by Leo the Syrian about two generations before it was attempted unsuccessfully, and therefore innocuously, in Western Christendom by Charlemagne. The disastrous effects of this Orthodox Christian *tour de force* have been mentioned in passing already² and are examined in greater detail below.³ In this place it is sufficient to take note of two of these effects, one general and the other particular.

¹ For these periodic raids, see Le Strange, G.: *The Lands of the Eastern Caliphate* (Cambridge 1905, University Press), pp. 132-9; Brooks, E. W.: 'The Struggle with the Saracens (717-867)', in *The Cambridge Medieval History*, vol. iv (Cambridge 1923, University Press), ch. v.

² See Part I. C (i) (b), vol. i, pp. 65 and 67, above.

³ In IV. C (iii) (c) 2 (β), vol. iv, pp. 320-405, below.

The general effect was a premature and excessive aggrandizement of the State in Orthodox Christian social life at the expense of all other institutions. The particular effect was the special consequence of the aggrandizement of the Orthodox Christian State at the expense of the Orthodox Christian Church. In Orthodox Christendom in the eighth century the Church suffered a fate which it escaped in Western Christendom until the sixteenth century, and which it only suffered then, immediately and completely, in those Western Christian countries that turned Protestant. In the eighth century, the Orthodox Christian Church was relegated to the position of a department of state; and thus, instead of serving as an institutional embodiment of the unity of Society, as the Roman Church served during the Western 'middle ages', the Orthodox Church served from the outset, like the 'established' churches of Protestant states in the modern age of Western history, to accentuate and aggravate the division and the strife which were produced in the bosom of Society by its articulation into sovereign independent states. The ultimate consequence was an internecine hundred years' war between an East Roman Empire and Patriarchate on the one side and a Bulgarian Empire and Patriarchate on the other which ended in a 'knock-out blow'; and this self-inflicted wound was the death of the Orthodox Christian Society.¹

It will be seen that the premature breakdown of the Orthodox Christian Civilization was the penalty of malformation due to overstrain, and that this overstrain was imposed upon the Orthodox Christian social fabric by the necessity of resisting the Islamic impact. In other words, the severity of the challenge which this Islamic impact presented to Orthodox Christendom was excessive.

The Abortive Far Eastern Christian Civilization

If we now turn our attention, in conclusion, to the eastern sector of the circular line of contact between the Christendoms and Islam, and examine the effects of the Islamic impact upon Nestorian Christendom, we shall find that the severity of the challenge here was greater still. An ordeal which condemned the Orthodox Christian Civilization to die a premature death actually prevented a 'Far Eastern Christian Civilization' from being born.

This embryonic Far Eastern Christian Civilization in a Nestorian chrysalis, which the Islamic impact rendered abortive, was germinating in the Oxus-Jaxartes Basin; and the blow that robbed it of its chance of coming to life was the permanent annexation of the

¹ For the Ottoman sequel to this 'time of troubles' in Orthodox Christendom, see Part III. A. vol. iii, pp. 26-7, below.

Oxus-Jaxartes Basin to the Arab Empire in A.D. 737-41.¹ The Arab Empire was a resumption or reintegration of the Syriac universal state which had originally been embodied in the Achaemenian Empire before the premature overthrow of the Achaemenidae by Alexander; and the Arab conquest of Transoxania re-extended the limits of the Syriac universal state, over against the Eurasian Steppe, to the line at which these limits had stood during the Achaemenian régime.² This restoration, however, was by no means a foregone conclusion; for, by the time when it was at last achieved by the Arab commanders Asad and Nasr, the Oxus-Jaxartes Basin had been politically divorced from the rest of the Syriac World for the best part of nine centuries;³ and this political divorce had been followed by a cultural estrangement.

The frontier drawn across the ancient Syriac domain from the highlands of Afghanistan down the basin of the Murghab and out on to the Transcaspian Steppe, which the Arab conquest of the Oxus-Jaxartes Basin obliterated in A.D. 737-41, was as old, and as deeply scored, as the more famous frontier—running from the Armenian highlands down the Euphrates Basin and out on to the North Arabian Steppe—which the Arabs had obliterated in A.D. 632-41, when they had conquered the Sasanian Empire with one hand and the Syriac provinces of the Roman Empire with the other. Moreover, the conquest of Transoxania, which was relatively remote from the Arabs' base of operations, instead of lying at the threshold of Arabia like Syria and 'Irāq, was only undertaken after a long delay and was only carried through to a successful conclusion after strenuous exertions. The Arabs had completed the conquest of the Sasanian dominions, up to the line of the Murghab, by A.D. 651; they did not seriously attempt the conquest of the Oxus-Jaxartes Basin till more than fifty years later, in A.D. 705; and their successive attempts, which began in that year, all failed to achieve more than a transitory success until in A.D. 736 the Arab commander Asad, like the Macedonian Alexander before him,⁴ supplemented an ineffective policy of force by a masterly policy of conciliation.⁵ Even so, the definitive Arab conquest of Transoxania, which followed in A.D. 737-41, was not confirmed until the Chinese, who had been supporting the Transoxanians in their resistance, were defeated by the Arabs on the banks of the River Talas in A.D. 751, just a century after the Arabs had reached the banks of the Murghab.

⁴ See II. D (v), p. 140, above.

⁵ For Asad's policy see Gibb, H. A. R.: *The Arab Conquests in Central Asia* (London 1923, The Royal Asiatic Society), pp. 80-1.

The embryonic civilization which was germinating in the Oxus-Jaxartes Basin at the time of the Arab conquest, and which resisted the annihilating impact so obstinately, though ultimately in vain, was the product of Central Asian history during those eight or nine preceding centuries during which the Oxus-Jaxartes Basin had been living a life of its own with special functions and special experiences.

The intrusion of Hellenism into the Syriac World at the heels of Alexander the Great affected the Oxus-Jaxartes Basin as profoundly as any other part of the Syriac domain, notwithstanding the fact that Transoxania lay at the opposite extremity of the Syriac World to the point at which Hellenism had made its entry. In spite of this geographical remoteness, the Bactrian and Sogdian oases received a greater infusion of Greek colonists—and therewith a stronger tincture of Hellenic culture—than many regions which lay nearer to the Aegean: the reason, no doubt, being the intrinsic importance of Transoxania as the march over against the Nomads of the Eurasian Steppe.¹ The process of Hellenization was even intensified, for a time, when the Greek settlers in Central Asia severed their political connexion with the Seleucid Macedonian 'successor-state' of the Achaemenian Empire in the middle of the third century B.C. and set up a Bactrian Greek Empire of their own; but there were other sequels to this Central Asian Greek secession which were of greater historical moment.

In the first place, the hostility between the Bactrian Greek Power and the Seleucid Power set up a barrier between the Oxus-Jaxartes Basin and the rest of the Syriac World—a barrier that was quickly broadened when, in the adjoining province of Khurāsān, a community of Nomad origin followed the Bactrian Greeks' example and founded a principality which began as a buffer state between the Bactrian Greek and the Seleucid Greek Power and ended as the so-called Parthian Empire.² In the second place, the Bactrian Greeks turned their arms against India and thereby opened the way for the intrusion of Hellenism upon the Indic World: an intrusion which is to be dated from the passage of the Hindu Kush by the Bactrian Greek prince Demetrius about 190 B.C., and not from Alexander's brilliant but ephemeral Indian campaign of 326—

¹ For this function of the Oxus-Jaxartes Basin, see II. D (v), pp. 138-50, above.

² The founders of 'the Parthian Empire' were Parni; and the Parni were one of the three semi-Nomadic hordes of the Dahae, who had been deposited in Transcaspiā by the same eruption out of the Steppes that had carried their neighbours and kinsmen, the Massagetae, to the Jaxartes, and the Cimmerians and Scythians as far west as the shores of the Black Sea and the Mediterranean. The particular war-band of Parni who founded 'the Parthian Empire' appear to have drifted out of Transcaspiā on to the northern rim of the Iranian Plateau *circa* 250 B.C.; and since their new home lay in the old Achaemenian province of Parthia, the Parthian name came to be applied both to the new arrivals themselves and to the empire which they eventually built up round this territorial nucleus.

325 B.C.¹ In the third place, the Greek Power in Bactria, alienated as it was from the Seleucidae and cut off from the main body of the Hellenic World by the rise of the Parthians in Khurāsān, proved unequal to the task of holding the Eurasian border of the Hellenized Syriac World against Nomad pressure.

In the last quarter of the second century B.C., the Nomads broke through the Bactrian frontier defences in two successive waves—Sakas² and 'Indo-Parthians' in the van, Yuechi or Kushans in the rear—submerged the oases of the Oxus-Jaxartes Basin and flooded on round, or over, the Hindu Kush into India in the footsteps of the antecedent Bactrian Greek conquerors. This barbarian Völkerwanderung put an end to Greek rule in Central Asia and in India. It did not, however, extinguish Hellenic culture in the regions on either side of the Hindu Kush which the Bactrian Greek princes had united under their sceptre. These Eurasian barbarians were Philhellenes;³ and under their aegis Hellenism survived to be an effective cultural force in the Kushan Empire, which was brought into existence in the first century of the Christian Era by the reunion of all the *ci-devant* Bactrian Greek dominions under the rule of an ex-Nomad dynasty. The effect of the Nomad influx was unfavourable not to Hellenism but rather to the Syriac Civilization in Central Asia. The cumulative effect of all the events that have just been recited was temporarily to disconnect the Oxus-Jaxartes Basin from the Syriac World and to connect it up with the Indic World instead. The north-eastern escarpment of the Iranian Plateau became a cultural and political barrier, whereas the statesmanship of local Greek and Kushan empire-builders temporarily 'abolished the Hindu Kush' as Louis XIV boasted himself to have 'abolished the Pyrenees'.

During the four hundred years or so—from the second century B.C. to the third century of the Christian Era—during which Central Asia and North-Western India were clamped together first under Greek and then under Kushan rule, this temporary political union had a momentous and enduring cultural result which was parallel, *mutatis mutandis*, to the cultural result that followed from the clamping together of Syria and the Hellenic World for an approximately equal length of time under the Roman Empire. In either case, the

¹ On this point, see I. C (i) (b), vol. i, p. 86, above.

² These Sakas appear to have been identical with the (Massa-)getae who had ranged the Steppes immediately adjoining the Oxus-Jaxartes Basin in the Achaemenian Age. They are probably represented by the modern Jāts of the Panjab (compare Annex V, below), and their companions or pursuers the Tochari by the Doghras.

³ Hellenism had previously proved attractive to the Scyths: a Nomadic people who had been carried out of the interior of Eurasia on to the steppes adjoining the north coast of the Black Sea in the preceding period of disturbance in Eurasia (*circa* 825–525 B.C.), and who had thus come into contact with the Greek movement of maritime expansion. (See the story of Scyles in Herodotus, Book IV, chs. 78–80.)

political union of heterogeneous cultural elements generated a great syncretistic religion: in the one case the Syro-Hellenic religion of Catholic Christianity, in the other case the Indo-Hellenic religion of Mahayanian Buddhism. The Mahayana grew up within the framework of the Kushan Empire as the Catholic Church grew up within the framework of the Roman Empire; but in Central Asia the situation was complicated by further factors.

One new factor was that, under the Kushan régime, the Oxus-Jaxartes Basin ceased to be a march between a civilization and a barbarism and became, instead, a corridor along which three different civilizations entered into communication with one another. In the last quarter of the second century B.C., immediately after the exodus of the Sakas and the Yuechi from the Central Asian Steppe, the Sinic Society, which at that time was living, under the Han Dynasty, through its universal state, expanded its spheres of exploration and influence westward, beyond the western extremity of the Great Wall, along the line of oases in the Tarim Basin, and thereby established contact with the Hellenic and the Indic Civilization which were then beginning, under the auspices of the Bactrian Greek Empire, to blend with one another in the Basin of the Jaxartes and the Oxus. The resultant commerce of cultures along this Central Asian corridor became more active at the turn of the first and second centuries of the Christian Era, when the dust of the Nomad Völkerwanderung was subsiding. The Han Empire and the Kushan Empire marched with one another in Central Asia for at least a century (*circa* A.D. 75-175); in the wars between them, the oases of the Tarim Basin were bandied to and fro between the one Power and the other; and thus the seeds of the Mahayana which were sown in the Tarim Basin during the periods when it was under Kushan rule were able to propagate themselves in the Far East during the periods when the Tarim Basin was united politically with China. In consequence, the Mahayana did not remain confined to the Kushan Empire in which it had originated. After issuing out of India across the North-West Frontier, it passed on in a curving orbit—skirting Tibet on three sides—through the Oxus-Jaxartes Basin and the Tarim Basin into the Far East;¹ and, like Catholic Christianity, it was destined to receive more honour in a new world than in its own birthplace. At the present day, the Mahayana is a mighty power in China and Korea and Japan while it is extinct in both India and Central Asia.

The extinction of Mahayanian Buddhism in India through the rise of a 'totalitarian' Indic religion in the shape of Hinduism does

¹ On the route by which the Mahayana reached the Far East, see II. D (vi), Annex, p. 405, footnote 1, below.

not here concern us.¹ Its extinction in Central Asia—where, as in India, this was a gradual process—was due to a resurgence of the Syriac Civilization which made itself felt in all parts of the buried, but not dead, Syriac body social. From the third century of the Christian Era onwards, this Syriac risorgimento manifested itself, as we have noticed in another connexion,² in the waves of religion which were periodically emitted by the Syriac internal proletariat. While Judaism had only defied Hellenism as a forlorn hope and Catholic Christianity had not defied Hellenism at all but had found its field of action in the Hellenic World as a Syro-Hellenic syncretism, most of the subsequent Syriac religious movements were deliberate and successful anti-Hellenic reactions.³ In the third century of the Christian Era, a Zoroastrian Church Militant constituted itself the established church of a Sasanian state whose mission was to fight Hellenism with temporal weapons by wresting back all ex-Achaemenian territories from the Roman Empire. In the fifth century, the Nestorian and Monophysite movements sought to wrest back Christianity itself from the Hellenizers by recovering the Syriac gold in the Christian syncretism from its Hellenic alloy; and both these anti-Hellenic Christian movements managed to survive: Nestorianism outside and Monophysitism actually inside the Roman frontiers.

The frontier between the Roman and Sasanian Empires was the line along which these battles were fought; but the forces there brought into action soon began to make themselves felt, as well, on the opposite frontier of the Sasanian Empire, where it marched with other ex-Achaemenian territories in the Oxus-Jaxartes Basin. The Kushan Empire broke up about the time when the Sasanian Empire came into existence; but the Sasanidae were no more successful on the north-east than they were on the west in their long efforts to restore the lost unity of the Syriac World by force of arms. The political heirs of the Kushans were not the Sasanidae but two fresh hordes of Nomad invaders who were carried out of the Steppes in this direction in the ensuing period of disturbance in Eurasia (*circa* A.D. 375-675). The Huns overran the *ci-devant* Kushan dominions in both Central Asia and India in the fourth and fifth centuries of the Christian Era; and the White Huns or Ephthalites, who had fastened upon the Oxus-Jaxartes Basin, were supplanted

¹ On this matter, see I. C (i) (b), vol. i, pp. 85 and 87, above, and II D (vi), Annex, in the present volume, p. 405, footnote 1, and V. C (i) (c) 2, vol. v, pp. 136-9, as well as Part IX, below.

² On pp. 234-6, and 285-8, above.

³ Manichaeism may be regarded as a partial exception. At any rate, it took pains, like Catholic Christianity before it, to propagate itself in the Hellenic World. Both Manichaeism and Mazdakism were directed, in the first instance, not against Hellenism so much as against the Zoroastrian established church of the Sasanian Empire. (See further V. C (i) (c) 2, Annex I, vol. v, pp. 575-80, below.)

there by the Turks in A.D. 563-8. Thus the political divorce of the Oxus-Jaxartes Basin from the rest of the Syriac World was still maintained. On the other hand, the Syriac Civilization began to recapture its lost Central Asian provinces not by force of arms but by the peaceful penetration of religious propaganda.

In this north-eastward expansion of Syriac religion, Zoroastrianism might have been expected to play the leading part in virtue of the geographical proximity of its base of operations on the Iranian Plateau; but it actually failed to play this part because it was handicapped by its status as the established religion of the Sasanian Empire, with which the rulers of Central Asia were at enmity. The Syriac religions which did successfully penetrate the Oxus-Jaxartes Basin under the Ephthalite and the Turkish régime were those which had been subjected to persecution in the empires in which they had first raised their heads; for their adherents were driven by *force majeure* to seek asylum abroad and were readily received by the Powers which were at enmity with the persecuting Governments, since the persecuted refugees could fall under no suspicion of intending to act as the secret agents of Governments before whose face they had fled. Thus Manichaeism, which was proscribed and persecuted in the Sasanian Empire in the third century of the Christian Era, and Mazdakism, which had the same experience in the Sasanian Empire in the fifth century, and Nestorianism, which was proscribed and persecuted in the fifth century in the Roman Empire and was therefore granted free passage into and across the Sasanian dominions, all in turn passed on into the Central Asian corridor and made their way through it into the Far East.¹ This new north-eastward radiation of Syriac culture in the form of religious waves was so vigorous that the Nestorian Christian wave, which was the latest in the series, had already reached the capital of the T'ang Empire, Si Ngan, in A.D. 636,² only just over two hundred years after the outcome of the Council of Ephesus had made life impossible for the Nestorians within the frontiers of the Roman Empire in A.D. 431. Contemporaneously, the Mahayana appears to have decreased in Central Asia as the Syriac religions increased. In the Oxus-Jaxartes Basin, it was evidently in decline by the time when the Chinese Buddhist pilgrim Hiuen Tsiang (Yuan Chwang) traversed the Central Asian corridor from east to west *circa* A.D. 629, *en route* from China to India.³

This was the situation in Central Asia at the moment when the Primitive Muslim Arab conquerors of the Sasanian Empire com-

¹ See Barthold, W.: *Zur Geschichte des Christentums in Mittel-Asien bis zur mongolischen Eroberung* (Tübingen and Leipzig, 1901, Mohr), pp. 10-16.

² See II. D (vi), p. 237, above. The date is established by the famous Christian inscription of Si Ngan.

³ Barthold, *op. cit.*, p. 11.

pleted their conquest by reaching the Sasanids' north-east frontier along the River Murghab in A.D. 651.¹ Their advent raised a momentous issue. Would the new Islamic wave of Syriac religion roll on in the wake of the preceding Nestorian and Mazdakite and Manichaean waves until it broke, in its turn, upon the western borders of the Far Eastern World?² Or would the Nestorian Christendom which had forestalled Islam in Central Asia succeed in resisting and repelling the Islamic impact? In other terms, was the embryo of a new 'Far Eastern Christian Civilization' in the Oxus-Jaxartes Basin to succeed or to fail in coming to birth?

In the middle of the seventh century of the Christian Era, all the local conditions in the Oxus-Jaxartes Basin appear to have been in favour of the genesis of a new civilization there. There had been a long and thorough local intermingling of cultures: Syriac and Hellenic and Indic. There had been an equally long and thorough local intermingling of races: an indigenous Iranian peasantry overlaid by a deposit of Iranian-speaking Nomads in the second century B.C. and by a further layer of Turkish-speaking Nomads (Ephthalites and Turks) in the fifth and sixth centuries of the Christian Era. And this fruitful diversity of the human element was preserved and accentuated by the character of the physical environment. The concentration of the sedentary inhabitants into a number of separate fortified oases (working together, it may be, with a lingering memory of the Hellenic social tradition which had been imported by Alexander and his successors) had resulted in the social articulation of the country into a number of politically independent but economically and culturally inter-connected city-states; and the princes and merchants of these city-states were on good terms with their Ephthalite and Turkish Nomad overlords, who were enlightened enough to understand that their own true advantage lay in fostering the prosperity of their sedentary vassals and not in killing the goose that laid the golden egg.

'The golden egg' of seventh-century Central Asia was the transit-trade along the corridor between the still surviving Roman Empire and the 'ghost' of the Sinic universal state which had just been revived in the Far East under the dynasties of the Sui and the T'ang.³ Under the aegis of the Ephthalite and Turkish khans, this trans-steppe commerce (which resembled maritime rather than overland trade) was being conducted, with profit to all parties concerned, by the merchants of the Transoxanian cities; and this

¹ See the masterly description in Gibb, *op. cit.*, pp. 1-11.

² This, of course, has been the actual outcome. The Syriac religion which has a footing in North-Western China at the present day is neither Manichaeism nor Nestorianism but Islam.

³ For the role of the T'ang Empire as a 'ghost' of the Han Empire, see Part X, below.

commerce was opening up, for the embryonic new civilization of the communities that were conducting it, the vast hinterland of the Eurasian Steppe. Transoxania possesses greater natural advantages as a 'jumping-off ground' for the conquest of the Steppe by a sedentary society than any of the other settled regions by which the coasts of the great Eurasian Steppe are bounded; and we have observed already¹ that even in the actual event, when Nestorianism had been robbed of its Central Asian base of operations through the Muslim conquest of Transoxania in A.D. 737-41, it very nearly succeeded in permanently converting the whole of the Eurasian Nomadic Society.

Thus, in the middle of the seventh century of the Christian Era, the new embryonic civilization in Central Asia had fair prospects in every quarter except the south-west, where the wave of Islam was welling up and menacingly raising its crest. If that menacing tide had been successfully stemmed, we must suppose that the embryo would have come to birth, and we can even conjecture to some extent the physiognomy which this civilization would have assumed if it had not been abortive.

The 'Far Eastern Christian Civilization' of Central Asia would probably have displayed a certain resemblance to the 'Far Western Christian Civilization' of Ireland.² The introduction of the germ of Christianity into Central Asia by Nestorian missionaries, just before Central Asia was isolated from the other Christendoms by the welling up of the Islamic wave in the midst of them, was analogous to the introduction of the germ of Christianity into Ireland by Saint Patrick just before Ireland was isolated from the other Christendoms by the settlement of the pagan English barbarians in Britain. In these circumstances, we have observed how, in Ireland, Christianity blended harmoniously with the indigenous culture of the island to create a new civilization with a high vitality and a distinctive character. If Nestorian Christianity in Central Asia had been able to repel the Islamic assault, or had been screened from its incidence as Ireland was screened from the incidence of the English assault by a Welsh buffer, we may conjecture that in those circumstances Nestorian Christianity would have followed the same course in the Far East that Patrician Christianity actually followed in the Far West. We can imagine Central Asian Nestorianism coming to some permanent local understanding with the Mahayana—and perhaps even with the remnants of Zoroastrianism as well; for the Zoroastrians, who maintained their independence in a fastness between the Elbruz Mountains and the Caspian for two or three hundred years after the Arab conquest of the rest of the Sasanian

¹ In II. D (vi), on pp. 237-8, above.

² See pp. 322-8, above.

Empire, had been chastened by adversity. In their new predicament they would assuredly have abandoned their traditional exclusiveness and intolerance (which had lost their *raison d'être* after the overthrow of the empire in which Zoroastrianism had been the established church); and we can imagine them making common cause with any forces in Central Asia which could offer them a *point d'appui* for that resistance to Islam which had become their absorbing occupation. We have, then, to conceive of the unrealized 'Far Eastern Christian Civilization' as based upon an entente between Nestorianism on the one hand and Buddhism and Zoroastrianism on the other: an entente which might have taken the alternative forms of coalescence (like the coalescence between Christianity and the Celtic Paganism in Ireland) or of eclecticism (like the abortive Neoplatonic Church of the Emperor Julian or the successful eclectic religion of Hinduism)¹ or of 'tri-religionism' (like the simultaneous practice of the Mahayana with Confucianism and Taoism by Buddhists in latter-day China, and with Confucianism and Shintoism by Buddhists in latter-day Japan).² On any of these alternative bases, we can imagine the rise of a great creative 'Far Eastern Christian Civilization' and picture it spreading from the oases of the Oxus-Jaxartes Basin over the Eurasian Steppe, and from Eurasia into the other regions round about.

Why did this potential 'Far Eastern Christian Civilization' fail to materialize? Or, in concrete terms, why did the Nestorian Christendom of the Oxus-Jaxartes Basin fail to resist the impact of the Arab Muslim conquerors during the critical century A.D. 651-751? The problem can be stated in this way: In (let us say) A.D. 721, the strategic position of the Arabs *vis-à-vis* the Oxus-Jaxartes Basin was not unlike their position at the same moment *vis-à-vis* Gaul. On both their Central Asian and their European front, at that moment, the Arabs were standing just on the farther side of a well-defined physical boundary at the threshold of a new world which they might or might not proceed to conquer. As early as A.D. 713, Musa had quietly occupied Septimania,³ while Qutaybah's more ambitious Central Asian campaigns of A.D. 705-15 had evoked a more vigorous riposte, with the result that, by the year 721, the

¹ For the nature of Hinduism and Neoplatonism, see further V. C (i) (c), 2 vol. v, pp. 136-9; V. C (i) (d) 6 (8), vol. v, pp. 565-7; V. C (i) (d) 6 (8), Annex, vol. v, pp. 680-3; and V. C (ii) (a), vol. vi, pp. 222-3, below.

² In the thirteenth century of the Christian Era, in Uiguria, Nestorianism and Buddhism were actually living cheek by jowl on a *modus vivendi* of mutual toleration. This relation between these two religions at that time and place has been put on record by the Western travellers who passed that way *en route* for the Court of the Mongol Great Khan. These Western travellers were naturally impressed by finding two would-be universal churches at peace with one another, in contrast to the perpetual state of 'Holy War' which was the contemporary relation between Western Christendom and Islam. (See Barthold, W.: *Turkestan down to the Mongol Invasion* (2nd ed. *Anglice*, translated and edited by Gibb, H. A. R.: Oxford 1928, University Press), pp. 389-90.)

³ See p. 361, above.

Arabs' holdings in Tukharistan and Transoxania, beyond the north-eastern foot of the Iranian Plateau, were no larger than their contemporary holdings in Gaul, beyond the northern foot of the Pyrenees.¹ By the year 732, after another dozen years of campaigning on either front, the respective positions were still apparently the same. By the beginning of the year 732, in consequence of the disastrous Battle of the Pass in 731, the Arabs had lost all but three posts beyond the Oxus, and all but one or two in Tukharistan; while at the same date, owing to the (less serious) reverse at Tours, they had retreated again to the Septimanian extremity of Gaul. Ultimate success was not in either case out of the question, but experience seemed to show that in both areas it could only be purchased at the price of great and sustained military efforts. In both areas, however, the sequel failed to bear out the natural expectations. The Battle of Tours was accepted as final, and from that time onwards the Arabs often lost, but practically never gained, ground on their north-western frontier. On the other hand, the seemingly not less serious situation on the north-east was so dramatically reversed during the next nine years that by A.D. 741 the whole of the Oxus-Jaxartes Basin had been incorporated definitively into the Arab Empire at a relatively small cost in the shape of fresh military operations.

How are we to account for the remarkable difference between Arab military fortunes in these two war-zones? Why did the Arabs fail to conquer Gaul and succeed in conquering Transoxania? One obvious explanation is to be found in the very much greater distance of the European war-zone from the Arab base of operations. We have already had occasion² to remark upon the inordinate length of 'Abd-ar-Rahmān's line of communications in A.D. 732 by the time when he had reached the Loire. The distance overland³ (and the Arabs did not command the Mediterranean) from the Umayyads' capital at Damascus to Narbonne, their advanced base on the threshold of Gaul, is approximately twice as great as the distance from Damascus to Merv, their advanced base on the threshold of the Oxus-Jaxartes Basin. This difference in distance explains much; yet the whole explanation of the difference between the outcomes of the two encounters can hardly lie here; for, while sheer distance told in favour of Western Christendom in its resistance to the Islamic impact, there were other factors—including certain geo-

¹ Qutaybah had penetrated far beyond the bounds of Khurāsān into Khwārizm and Farghana. It has been shown, however, by Mr. H. A. R. Gibb (in *op. cit.*, pp. 29-87) that Qutaybah's campaigns in the Oxus-Jaxartes Basin, though brilliant and extensive, were superficial, and that the results were almost entirely lost, within six years of his death (*op. cit.*, p. 55), by a Central Asian counterstroke.

² On pp. 203 and 361, above. On this point see further II. D (vii), Annex IV, pp. 428-9, below.

³ Via North Africa and the Straits of Gibraltar.

graphical factors—in which Far Eastern Christendom had the advantage.

For example, the Pyrenees were not nearly so formidable a political and cultural barrier in the first half of the eighth century of the Christian Era as the north-eastern escarpment of the Iranian Plateau. By that date the Oxus-Jaxartes Basin had been divorced politically, and to a large extent also culturally, from Iran for close upon nine hundred years; and there was a profound cleavage in tradition and *éthos* between the two regions. On the other hand, eighth-century Aquitaine had a stronger sense of affinity with the Iberian Peninsula—a country with which Aquitaine had been united politically not only under the Roman Empire but also for a time thereafter under the Visigothic 'successor-state'—than she had with Northern Gaul: an ex-Roman territory that had been barbarized by the immigration of the Franks.¹ Although, by the year 732, Aquitaine had been subject to Frankish political domination for more than two centuries—ever since Frankish Clovis had won his victory over Gothic Alaric at Vouillé in A.D. 507²—the Aquitanians had never become reconciled to Frankish rule; and if 'Abd-ar-Rahmān had won a victory over Charles Martel in A.D. 732, or had even subsequently retrieved his defeat, the Aquitanians would assuredly have been well content to exchange a Frankish for an Arab master. In this important matter of local political sentiment, the conditions were certainly less unfavourable to the Arabs in Gaul than they were in Transoxania.

As compared with Gaul, again, Transoxania possessed other assets as well. From the military point of view the Empire of the T'ang may have proved a broken reed, but the diplomatic support against the Arabs which the independent states of Transoxania and Tukharistan were constantly receiving from the Court of Si Ngan was at any rate an effective moral weapon, especially since, to the Arabs, its value long remained imponderable and therefore subject to over-estimation. The Aquitanians, Neustrians, and Austrasians, in the crisis of A.D. 713–32, do not appear to have received either naval assistance in the Mediterranean or diplomatic support at Damascus from the Court of Constantinople, so that both the fighting and the bluffing had all to be their own. In matters of topography and climate, moreover, Transoxania was a more difficult country than Gaul for the invader. The cultivated areas were not continuous, but were separated by stretches of steppe and desert; the rivers, being mightier streams than the Garonne, the Loire, or the Seine, offered correspondingly greater obstacles; and

¹ See II. D (vii), Annex IV, p. 428, below.

² For the Battle of Vouillé, see II. D (v), p. 166, above.

between the crossing of the Oxus at Tirmidh and the Transoxanian metropolis of Samarqand there were formidable mountains to be traversed which had not their like at any point on the road from Narbonne to Tours. As for political unity, it was still hardly more than nominal in the Frankish dominions at this period and was of little account for the practical purpose of military co-operation, so that, even from this point of view, the Transoxanians and Tukharistanis were scarcely at a disadvantage as compared with the peoples of Gaul, while such disadvantage as there may have been was no doubt more than compensated by the greater vitality of local political life in the Oxus-Jaxartes Basin and the distinctly higher level of general civilization.

These further considerations have to be set off against the simple explanation of the difference between the Arabs' military success in Central Asia and their military failure in Europe in terms of the relative distance of the two theatres of war from Arabia. In fact, they diminish the force of this explanation to such a degree that we can hardly regard the problem as solved unless some supplementary explanation is forthcoming. Perhaps the higher level of general civilization that prevailed in Transoxania at the time supplies the clue.

In what, after all, did the superiority, in this respect, of Transoxania over contemporary Gaul consist? Undoubtedly in an immeasurably greater development of international trade, as might be expected in a region which had long been, and still was, a corridor of communication between surrounding societies, whereas the Gaul of that day was a semi-civilized region penned up in a blind alley at the ends of the Earth. That difference has an important bearing on our problem, for it means that the eighth-century population of Gaul possessed no vital commercial interests which would be damaged or promoted by possible alternative relations between them and the Arab Empire. At that date they were an agricultural society, and little more besides—such commerce as existed between Gaul and the rest of the World being then largely carried on by Italians, Syrians, and other outsiders. Transoxania, on the other hand, was a commercial community first and foremost.¹ Her numerous and well-peopled cities could not subsist upon the local oasis-cultivation, the extent of which was limited by a restricted water-supply, however scientific the methods of irrigation. For such a society, international trade was not a mere optional source of surplus profit but a necessity of existence; and each new development of the struggle with the Arabs struck a fresh blow at this staple of Transoxania's economic life.

¹ On this, see Gibb, *op. cit.*, especially pp. 2, 5, and 88.

During the first phase of the struggle, which may be dated from Qutaybah's opening campaign in A.D. 705 down to A.D. 719 (by which year the greater part of his work had been undone through the unaided efforts of the Transoxanians and Tukharistanis themselves), the damage to trade was evidently not intolerable. The commercial classes in the Oxus-Jaxartes principalities were not yet faced by an unprecedented situation, for the Arab Empire in this quarter had simply stepped into the shoes of the Sasanian Empire, with which the Transoxanian Powers had frequently been at war. During these earlier hostilities, the Government at Ctesiphon appears, on more than one occasion, to have placed embargoes upon Transoxanian trade along routes that traversed the Sasanian dominions; but they had never succeeded in dealing that trade a mortal blow, and the Sughdi merchants had shown enterprise and ingenuity in opening up alternative lines of communication with their Mediterranean customers.¹ Even, moreover, if their trade with the Roman Empire were temporarily cut off, they still remained the monopolists of the overland route between the Far East and India, and the volume of this branch of commerce was no doubt sufficient to secure them against anything like an economic catastrophe. This was the situation down to A.D. 719; but it was altered—and, as it turned out, very much for the worse from the point of view of Transoxanian trade—when, in A.D. 720–1, the Türgesh Nomads from the heart of the Eurasian Steppe began to take a hand in the struggle between the Transoxanian city-states and the Arab Empire.

The Türgesh intervened as mandatories of the Government of Si Ngan and as auxiliaries of the Transoxanians in their war of liberation; and, as far as fighting the Arabs was concerned, they performed their task efficiently. For seventeen years they kept the Arab forces on the defensive, inflicted upon them several military disasters, and gradually forced them out of their fortresses beyond the River. The nominal beneficiaries discovered, however, that the remedy was worse than the disease. Officially, the Türgesh were the subjects and agents of China; but the Chinese authorities exercised no supervision, and the Türgesh evidently behaved as irresponsible Nomads do behave when they find themselves in military control of sedentary populations. The eastern trade-routes were cut; and, when the Türgesh actually crossed the Upper Oxus and began to push the Arabs out of Tukharistan, that must have

¹ e.g. the embassy which arrived in A.D. 568 at the Court of Constantinople from the Khaqan of the Nomad empire of the Turks included a Transoxanian prince, whose object was to open up a trade-route north of the Caspian and therefore beyond the reach of interference by the Persians. It seems probable that this embassy was sent on the initiative of the Transoxanian merchants, though it was headed by a representative of their suzerain, the Turkish Khaqan.

made matters still worse from the economic point of view, for the insecurity was thereby extended to the routes between Transoxania and Hindustan. Meanwhile, the Chinese suzerains of the Türgesh had already become so incensed against their unmanageable vassals that they took the opportunity of a victory which was gained at last (in A.D. 737) by the Arab governor Asad over the Türgesh Khaqan in Juzjān and Khurāsān to destroy the Türgesh Confederacy and to disperse the horde. It is safe to conjecture that the Transoxanian commercial classes, on whom the direct losses had fallen, felt even more bitterly against the Türgesh than did the Government of the T'ang, and this explains the immediate and general success which attended the conciliatory policy that had already been initiated by Asad and was being followed out by his successor Nasr.

In 736 Asad appears to have come to an understanding with the Iranian notables of Tukharistan. The national capital of Balkh, ruined in the previous wars, was rebuilt, under Asad's auspices, by the Tukharistanis themselves, in order to replace Merv as the seat of the Arab provincial administration. This step was taken by Asad the year before his victory over the Türgesh, and the succeeding year (A.D. 738) was signalized by Nasr's declaration of amnesty and guarantee of rights to the peoples of the Oxus-Jaxartes Basin. The tolerance of non-Arab nationalities and non-Islamic religions, upon strict but not unbearable conditions of inferiority, was a permanent feature in the policy of the Arab Empire—a feature without which that Empire could never have achieved its astonishing triumphs. Nasr's charter, however, appears to have been exceptionally favourable; and, by granting it, he offered the Transoxanians an honourable escape from the terrible choice between political servitude and commercial ruin. On condition of accepting Arab sovereignty on not intolerable terms, they were given the prospect, not merely of commercial recovery, but of perhaps unprecedented prosperity.

If once the political objections to incorporation into the Arab Empire were surmounted, there could be no doubt of its advantages from the economic point of view; for, in place of a permanent military front upon their south-western border, it opened up to Transoxanian merchants a hinterland stretching from Khurāsān to the Mediterranean and from the Mediterranean to the Atlantic. Moreover, Arab statesmanship set itself promptly to reopen the trade-routes leading along the Central Asian corridor to the Far East. 'Shortly after his recapture of Samarqand' (probably in A.D. 739), Nasr 'sent an embassy to China. This was followed up in 744 by a much more elaborate embassy, obviously intended to regulate commercial relations in the most complete manner possible,

in which the Arabs were accompanied by ambassadors not only from the Sogdian cities and Tukharistan, but even from Zabulistan' (south-east of the Hindu Kush), 'Shash, and the Türgesh. Two other Arab embassies are also recorded in 745 and 747.'¹ The inclusion of representatives from Zabulistan suggests that steps had already been taken to reopen the overland trade-route to India.

These facts² satisfactorily explain the ease and the permanence with which the Oxus-Jaxartes Basin was incorporated into the Arab Empire between A.D. 737 and A.D. 741. Do they not also suggest a reason for the failure of the Arabs, during the same period, in Gaul? The non-commercial Aquitanians and Neustrians were not confronted with the same dilemma as the Transoxanians in dealing with the Arabs. They had little or no foreign commerce to lose by war with the great neighbouring Power; in defending their political independence, they were at the same time defending their fields, which were the source of their prosperity as a primitive agricultural population; and by summoning their over-lords, the Austrasians, to the rescue, they were not exposing themselves to any such economic calamities as those which the Transoxanians incurred when they called in the Türgesh.

If this line of argument is correct, the superior civilization of eighth-century Transoxania—in other words, her higher commercial development—as compared with eighth-century Gaul was the principal reason why she succumbed to Arab imperialism and lost this opportunity of founding a distinctive civilization of her own, whereas Gaul preserved her liberty of self-determination and so eventually gave birth to that Western Civilization in which we ourselves still live and move and have our being.

Whatever the true explanation of the actual course of history on this occasion may be, it is evident that, in the capitulation of A.D. 737-41, the unborn Far Eastern Christendom renounced its birth-right.

We can now arrange our series of collisions between Islam and the several Christendoms in a sequence. The impact of the Islamic wave upon the Monophysite Christendom of Abyssinia was so feeble that it hardly administered any perceptible stimulus. The more vigorous impact upon Western Christendom was highly stimulating, as is demonstrated by the vigour of the response. The considerably more forcible impact upon Orthodox Christendom was so severe that the social structure of Orthodox Christendom was permanently warped and its social fabric fatally overstrained by the *tour de force* of holding its ground. The impact upon Nestorian Christendom

¹ Gibb, *op. cit.*, p. 92.

² Established and interpreted by Professor Gibb in *op. cit.*

caught this Christendom while it was still in embryo and dealt it a blow that rendered it abortive. It is evident that the severity of the Islamic challenge to Western Christendom was of the optimum degree; that the challenges to Abyssinian Monophysite Christendom and to Central Asian Nestorian Christendom were both equally remote in degree from the ideal mean, though this in opposite directions; and that the challenge to Orthodox Christendom, while less remote from the mean than either of these other two challenges, was still decidedly beyond the limits of the optimum, and this in the direction of excessive severity.

Miscarriages and Births of Civilizations in Syria

One further example of Challenge-and-Response in which the challenge has been presented in the human sphere may suffice to conclude this survey of serial encounters in which an identic challenge is delivered on different occasions with different degrees of severity and with resultant responses that differ by comparison with one another in the respective degrees of their failure or success.

This final instance of our present object of study is the human challenge presented to the inhabitants of Syria, on successive occasions when they have been moved to create an independent local Syriac Civilization, by the geographical proximity of the Egyptiac Civilization on one flank, and the Sumeric (followed by the Babylonian) Civilization on the other flank, as 'going concerns'. This human challenge became potential from the time when, under pressure of the desiccation of the Afrasian Savannah into the Afrasian Steppe, the fathers of the Egyptiac and Sumeric civilizations braved and mastered the physical challenge of the Nilotic and Euphratean jungle-swamps, whereas in Syria—the section of Afrasia that lies in between the Land of Egypt and the Land of Shinar—the corresponding challenge which was there presented by the Jordan Valley was left unanswered by Afrasian Man.¹ Thenceforward, any movement to create an independent civilization in Syria was exposed to a challenge from the presence of the civilizations that were now already established in close proximity on either side; and this challenge continued to be presented in some degree until the extinction without issue of the Babylonian Civilization in the Lower Tigris-Euphrates Valley in the last century B.C. was followed, in the fifth century of the Christian Era, by the extinction without issue of the Egyptiac Civilization in the Lower Nile Valley.

Within this long period of some four thousand years during which the challenge now under consideration was operative, there

¹ See II. C (ii) (a) 2, vol. i, pp. 256-7, above, especially the quotation from Eduard Meyer on p. 257.

is one conspicuous occasion on which it was taken up successfully. The Syriac Civilization which came to birth towards the end of the second millennium B.C. is perhaps the most brilliant and most original representative of the species, next to the contemporary Hellenic Civilization, that has appeared up to date within the period of some six thousand years during which this species of societies has so far been in existence. This Syriac Civilization, as we have remarked at other points in this Study, has three great feats to its credit.¹ It invented an alphabetic system of writing; it discovered the Atlantic Ocean; and it arrived at a particular conception of God as a personal and moral and unique and omnipotent being. And it performed these great works of creation independently of the two imposing civilizations which overlooked its tiny original domain from either side.

The Syriac Civilization; arising in an interstice between the Egyptiac Society and the Babylonian, was neither beholden to, nor impeded by, either of them;² and, so far as it was related to any antecedent civilization at all, its affinity was not with a society whose roots were in the soil of Egypt or Shinar but with the relatively distant Minoan Civilization of the Aegean. In virtue of this affinity, the Syriac Civilization was not only the contemporary of the Hellenic Civilization but its sister; and it revealed its common descent from the Minoan Civilization in a common taste for long-distance deep-sea navigation: a taste which made the Phoenicians and the Greeks, between them, the masters of the entire basin of the Mediterranean by the middle of the last millennium B.C. Even, however, in its relation to the sister Hellenic Civilization and to the antecedent Minoan Civilization, the Syriac Civilization maintained its

¹ See I. C (i) (b), vol. i, pp. 82 and 102; and II. D (ii), p. 50, above.

² It used to be assumed—on rather slender evidence—that the Phoenicians were beholden to the Egyptiac Society for the Alphabet. The subsequent discovery of the several Minoan scripts has evoked the counter-conjecture that the Alphabet may be of Minoan origin. (See I. C (i) (b), vol. i, p. 102, footnote 3, above.) Pending a settlement of this controversy, we may say at once that, even if the earlier view of the Egyptiac origin of the letters of the Alphabet were eventually to be confirmed, this would not deprive the Phoenicians of the credit of having invented the Alphabet; for the essence of the invention lies not in the equation of particular signs with particular sounds, but in the analysis of the sounds of human speech into a minimum number of simple elements. Both the Egyptiac and the Sumerian script, in so far as they were phonetic at all and not ideographic, were content to represent whole syllables, without pushing the analysis further. The further analysis of syllables into their consonantal elements was the new Syriac invention which gave birth to the Alphabet; and the invention is just as great an invention if the inventors happen to have used Egyptiac or Babylonian syllable-signs to represent the consonants as if they had coined brand-new signs to represent the new elements of sound which they had succeeded in isolating by analysis. As a matter of fact, the post-war researches of Western archaeologists in Syria have brought to light, in the north, an alphabetic script employing signs which are quite different from those of the historic Alphabet and which seem to be borrowed from the signs of the Babylonian Syllabary. This discovery indicates that the Syriac inventors of the Alphabet were experimenting simultaneously with different traditional materials. (The question of the origin of the Alphabet has been touched upon already above in I. C (i) (b), vol. i, p. 102, footnote 2, and in II. D (ii), pp. 50-1.)

independence. For the greatest creative achievement of the Syriac Society was neither its discovery of the Atlantic nor its discovery of the Alphabet but its discovery of God; and the particular conception of God at which the Syriac Society arrived—a conception which is common to Judaism and Zoroastrianism and Christianity and Islam—is alien (as we have seen) not only from Babylonian religious thought and Egyptian religious thought (apart from the flash of illumination in the single soul of Ikhnaton) but also from Hellenic religion and from Minoan (as far as the *ethos* of Minoan religion is known to us).

Thus the historical Syriac Civilization proclaims, in its magnificent creative originality, the triumphant success of its response to the challenge which the proximity of the Egyptian and Babylonian civilizations presented to it. Yet, without disparaging the Syriac achievement, we may notice that this successful Syriac Civilization came to birth at a juncture when the social pressure exerted upon Syria from Egypt on the one side and from Shinar on the other was at less than its average strength.¹ The post-Minoan interregnum, during which the Philistine wave of Minoan refugees broke upon Syria from the Eastern Mediterranean and the Hebrew wave of Afrasian Nomads from the North Arabian Steppe, may be dated, in round figures, between 1425 and 1125 B.C.; and during these three centuries, in which the Syriac Civilization actually emerged, both the Egyptian and the Babylonian Society were in a low state of vitality. The Egyptian World was then wholly on the defensive. Its energies were being absorbed in the effort of self-preservation amid the formidable social convulsions which the dissolution of the Minoan Civilization was producing in the Levant; and so long as 'the New Empire' succeeded in saving the homelands of the Egyptian Civilization in the Nile Valley from being overwhelmed, it was content to leave Syria to take care of itself. On the other flank of Syria, in the same age, the Babylonian Civilization, which had recently taken the place of the Sumerian Civilization, was equally passive; for Babylonia was still torpid under the feeble rule of the last epigoni of her Kassite barbarian conquerors, while Assyria had not yet started upon her career of militarism.² As for the sister civilization which the Hittites had created in Anatolia, this had been shattered, in the course of the post-Minoan *Völkerwanderung*, by the impact of the great migration at the beginning of the twelfth century B.C.: an impact which the Egyptian Civilization

¹ This point is noticed by Eduard Meyer in his 'Zur Theorie und Methodik der Geschichte' (*Kleine Schriften* (Halle 1910, Niemeyer), p. 56).

² The Third (Kassite) Dynasty of Babylon 'petered out' circa 1173 B.C.; Tiglath-Pileser I of Assyria, who made the first tentative essay in Assyrian militarism, reigned circa 1115-1089 B.C.

just managed to resist by the expenditure of its last remaining reserves of vitality.¹

Thus, in observing that the historical Syriac Civilization responded to the challenge of Egyptiac and Babylonian proximity with conspicuous success, we have also to observe that it made this successful response at a time when the challenge was presented in less than its normal degree of severity; and in order to appraise this success we must compare it with a previous failure. For the creation of a Syriac Civilization was not achieved at the first attempt. The successful attempt which resulted in the historical Syriac Civilization had been preceded on the same Syrian soil, some four or five centuries earlier, by a similar attempt which was abortive.

We have come across this earlier Abortive Syriac Civilization already in other connexions.² We have seen that when 'the Empire of Sumer and Akkad', which was the Sumeric universal state, broke up, and the Sumeric Civilization itself went into dissolution, after the death of Hammurabi at the end of the twentieth century B.C., the former domain of the Empire was overrun by Aryan Nomadic invaders from the Eurasian Steppe; and that one horde of these invaders—the people who afterwards became known in the Egyptiac World as the Hyksos—migrated right across the breadth of the Sumeric World from north-east to south-west and came to a halt at the furthest extremity of that world, in Syria.

At that time Syria was a kind of debatable border or no-man's-land or limbo between the Sumeric World and the Egyptiac World. The rift-valley of the Jordan—having failed to evoke from Man the response which had given birth to civilizations in the valleys of Euphrates and Nile—remained desolate and uninhabited; and the Hill Country of Ephraim was still uninhabited likewise.³ On either side of these physical barriers, the Sumeric and Egyptiac civilizations had respectively acquired footholds on Syrian soil and had staked out spheres of interest. The Egyptiac Civilization had radiated up the coast of Syria as far as Byblos soon after, or possibly some time before, the foundation of the Egyptiac United Kingdom *circa* 3200 B.C.; and Byblos, which was its farthest bourne, was also its firmest *point d'appui* in this quarter. From the other side, the interior of Northern Syria was raided as far as the Jabal Ansariyah and the Lebanon, and even occasionally as far as the Mediterranean coast, by the Sumerian militarist Lugalzaggisi of Uruk (Erech) and Umma (*regnabat circa* 2677–2653 B.C.) and his

¹ See I. C (i) (b), vol. i, pp. 93 and 101, above.

³ See the present Study, II. C (ii) (a) 2, vol. i, p. 257, and II. D (ii), in the present volume, p. 53, above, as well as Meyer, E.: *Geschichte des Altertums*, vol. ii (i), and ed. (Stuttgart and Berlin 1928, Cotta), p. 96.

Akkadian supplanters and emulators Sargon (*regnabat circa 2652-2597*) and Naramsin (*regnabat circa 2572-2517*);¹ and the seeds of Sumeric culture which were scattered in the west by these passing whirlwinds of military conquest took permanent root among the Amorites: a Semitic-speaking Nomadic people who appear to have drifted off the North Arabian Steppe and silted up against the eastern flank of Lebanon about the middle of the third millenium B.C.,² as their fellow-Semites and fellow-Nomads, the Aramaeans, drifted from the same starting-point to the same resting-place some twelve centuries later.³

The Amorite settlers in the interior of Syria became incorporated into the Sumeric body social, worked their way towards the heart of the Sumeric World, and eventually founded the First Dynasty of Babylon, which was also the last dynasty to rule and maintain the Empire of Sumer and Akkad. Thus, by the time when the Empire finally broke up after the death of Hammurabi, the greatest of the latter-day Amorite emperors, the interior of Syria had long formed an integral part of the Sumeric World; and when, in the ensuing *Völkerwanderung*, Syria was overrun by a horde of barbarians who had broken into the Sumeric World from the Eurasian Steppe, it might have been expected that the local outcome would have been similar to the outcome in Babylonia and in Cappadocia. In both these other *ci-devant* provinces of the defunct Sumeric universal state, the interregnum occupied by the post-Sumeric *Völkerwanderung* was followed by the emergence of new civilizations, closely related to the Sumeric, which were built up by the joint efforts of the ex-provincials and the immigrant barbarians.⁴ In Babylonia, the new Babylonian Civilization emerged after the irruption and settlement of the Kassites; in Cappadocia, the new Hittite Civilization emerged after the irruption and settlement of the 'Kanisians' and the 'Luvians'.⁵ Why was it that, in contemporary Syria, a new Syriac Civilization did not emerge simultaneously after the irruption and settlement of the Hyksos? In other words, why was it that the potential Syriac Civilization of this age miscarried and never came to birth?

The explanation of this miscarriage seems to be that the Aryan Nomadic invaders of the Empire of Sumer and Akkad who settled in its Syrian province overshot the boundaries of the Sumeric

¹ For these militarists and their role in Sumeric history, see I. C (i) (b), vol. i, p. 109, above.

³ For the Aramaeans, see II. D (v), pp. 134-5, above.

⁴ See I. C (i) (b), vol. i, pp. 110-12, above.

⁵ For these barbarians, who spoke Indo-European languages of 'the Centum-group' and who had presumably descended upon the Sumeric World from South-Eastern Europe, see I. C (i) (b), vol. i, p. 113, footnote 3, above.

World, impinged upon the Egyptian World, and became implicated, to their own undoing, in the course of Egyptian history. The settlement of the Hyksos in Syria, which may be dated between the death of Hammurabi *circa* 1905 B.C. and the foundation of the Kassite 'successor-state' of Hammurabi's Empire in Babylonia *circa* 1749 B.C.,¹ would normally have been followed by a long period of local stagnation and quiescence; but in Syria, unlike Babylonia and Cappadocia, this normal sequel to a *Völkerwanderung* did not follow, and therefore, on this occasion, the promise of a new Syriac Civilization did not come to fruition; for, without a spell of quiescence and recuperation after the tumult in which it has been conceived, an embryonic civilization can never be brought to birth.

The reason why the Hyksos were unable to settle down after their arrival in Syria was because the province of the defunct Empire of Sumer and Akkad into which Fate had carried them happened to be in immediate proximity to the Egyptian World.

The site at the southern extremity of the Syrian coast, which the Hyksos selected for the capital of their 'successor-state',² actually lay within the Egyptian and not within the Sumeric sphere; and soon after the beginning of the seventeenth century B.C., perhaps not more than a century after the Hyksos had made their headquarters here, an event occurred in the Egyptian World which could not leave the Hyksos indifferent. The Egyptian universal state (the so-called 'Middle Kingdom', which lasted from *circa* 2075 to *circa* 1675 B.C.) broke down;³ an interregnum ensued in the Egyptian World which was comparable to the Sumeric interregnum that had set in after the death of Hammurabi some two centuries earlier; and, once again, the Hyksos were drawn into the vacuum. Instead of settling down to collaborate with the Canaanites in the gradual building up of a local Syriac Civilization, they struck the tents which they had so lately pitched and marched on into Egypt, as they had once marched across Shinar into Syria, in their old role of barbarian invaders.

The consequences of this diversion of the Hyksos' energies from Syria to Egypt were disastrous to all parties; but they were disastrous first and foremost to the Hyksos themselves; for the tincture of Sumeric culture which the Hyksos had acquired *en route* made them unassimilable by, and therefore abominable to, their Egyptian subjects.⁴ Thus the first effect of the Hyksos' conquest of the Egyptian World was to evoke a militant Egyptian reaction; and this

¹ See I. C. (i) (b), vol. i, p. 111, footnote 1, above.

² For the archaeological excavations on this site, in 1931, see a letter from Sir Flinders Petrie in *The Times*, 31st May, 1931.

⁴ See I. C. (ii), vol. i, pp. 139, footnote 1, and 144, above.

reaction was victorious. The Hyksos were driven out of Egypt again, within a century of their original entry, by a restored Egyptian universal state;¹ and 'the New Empire' was not content to bring its successful counter-offensive to a halt at the Syrian border. It followed up the discomfited Hyksos in their retreat and annexed the Syrian territories which the Hyksos had previously taken over from the Empire of Sumer and Akkad, right up to the Euphrates. The Aryan personal names of certain Syrian princes which are preserved in 'the New Empire's' official records testify that the Hyksos survived in Syria for some centuries longer as a people;² but they only survived under Egyptian dominion; their political power was at an end; and, more than that, their chance of creating a Syriac Civilization had vanished.³ In yielding to the temptation of invading a prostrate Egypt, the Hyksos had thrown away their Syrian birthright. The distracting proximity of Egypt to Syria thus explains why, in the first half of the second millennium B.C., the promise of a Syriac Civilization, related to the Sumeric Civilization, came to nothing, while a Hittite and a Babylonian Civilization were successfully brought to birth. In Syria, this miscarriage was followed by a period of frustration which lasted until 'the New Empire' of Egypt had run its course and until the post-Minoan Völkerwanderung supervened to offer a new opportunity for creation: an opportunity which was seized this time, as we have seen, with brilliant success.

Thus the challenge to which the historical Syriac Civilization responded triumphantly had proved excessive when it had been presented on an earlier occasion with greater severity; but there was another occasion on which a civilization that had been conceived and duly born on Syrian soil was manifestly starved of stimulus because this very challenge of Egyptian and Babylonian proximity had ceased to operate.

By the time when the Arabic Civilization emerged in Syria after the post-Syriac interregnum (*circa* A.D. 975-1275), both the Egyptian and the Babylonian Civilization had long been extinct. Their extinction had been accomplished by the society to which the nascent Arabic Civilization was 'apparented': that is to say, by the historical Syriac Civilization itself. For the Syriac Civilization—acting as though it were conscious of the Egyptian and Babylonian menace—had set itself, from the moment of its own birth, to devour its two venerable neighbours and to absorb their tissues into its own body social. The process began with the peaceful penetration of Egypt

¹ See I. C (ii), vol. i, pp. 138 and 144; and II. D (v), p. 112, above.

² See I. C (i) (b), vol. i, p. 105, footnotes 4, 5, and 6 above.

³ For the lack of originality in the local culture of Syria in that age, see Meyer, E.: *Geschichte des Altertums*, vol. i, part (ii), 3rd ed. (Stuttgart and Berlin 1913, Cotta), p. 682.

and Assyria by Phoenician and Aramaean traders; it was completed by the successive conversions of the Egyptian and Babylonian worlds to a series of Syriac missionary religions: Primitive Christianity and Nestorianism and Monophysitism and Islam. By the time when the Syriac Civilization died at last—after a life that had been unnaturally interrupted but also unnaturally prolonged by a Hellenic intrusion—the work of assimilation had been performed so thoroughly that Egypt on the one side and 'Irāq on the other were now just as Syriac as Syria herself.

Thus, when the Arabic Civilization was in embryo, it was not confronted with the challenge which had proved so stimulating to the historical Syriac Civilization and so upsetting to its abortive predecessor. While the Syriacized land of 'Irāq lay derelict on the morrow of the Mongol devastation, the Syriacized land of Egypt offered the embryonic Arabic Civilization a safe citadel in which its birth could be accomplished. The ancient challenge of Egyptian and Babylonian proximity to Syria had entirely ceased to operate. Yet, if we are justified in concluding that, in the first half of the second millennium B.C., the severity of that challenge was excessive, we are also bound to conclude that the entire cessation of the challenge by the time when the Arabic Civilization was in gestation, at the turn of the first and second millennia of the Christian Era, was an untoward circumstance. For the Arabic Civilization which had this easy birth did not have a distinguished career.¹ Its possession of a citadel in Egypt gave it no substantial security; for its independence was prematurely brought to an end by the masterful intervention of a sister society—the Iranian—which had been nurtured in a harder environment. Yet, before this misfortune overtook it in the early decades of the sixteenth century of the Christian Era, the Arabic Society had been granted two centuries' grace in which to prove its mettle; and the time was long enough to show that no great creative forces were gathering in its bosom. If the Arabic Civilization had not had such an easy start but had been confronted at the beginning by the challenge which Egyptian and Babylonian proximity had presented to its Syriac predecessor, it would assuredly have acquitted itself with greater distinction than it actually achieved.

It will be seen that this Syrian series of encounters has presented us with a sequence once again. The brilliantly successful response of the historical Syriac Civilization to the challenge of Egyptian and Babylonian proximity proves to be a middle term between two extremes. On the one hand, the greater severity with which the same

¹ For the career of the Arabic Civilization, see I. C (i) (b), vol. i, pp. 70-2, with Annex I, above.

challenge was presented in the first half of the second millennium B.C. rendered a first attempt at creating a Syriac Civilization abortive. On the other hand, the complete absence of this challenge in the history of the subsequent Arabic Civilization—a younger local civilization which was 'affiliated' to the Syriac—had an untoward effect upon this latter-day civilization's career. In this sequence, the historical Syriac Civilization, to which the identic challenge was presented in a mean degree of severity, stands out as the conspicuous instance of success against a double background of failure: failure from an excess of stimulus and failure from a lack of it.

Perhaps we are now in a position to answer the question which originally drew us into our present inquiry. After finding, by our empirical methods of study, that, in diverse instances and variations of the movement of Challenge-and-Response, 'the greater the challenge the greater the response' appeared to be a working 'law', we then set out to discover whether this 'law' which we had traced inductively were valid absolutely, or whether it were subject, like so many other particular laws, to the general 'law of diminishing returns'. The inquiry which we have just concluded indicates that 'the law of diminishing returns' does hold good in this connexion. In the language of Mythology, the encounter between two super-human personalities, which is the dynamic force in human affairs and the key to the plots of the great tragic works of art, does not result *semper et ubique et omnibus* in the denouement which is given to the play in the Book of Job and in Goethe's *Faust*. A wager between God and the Devil in which the Devil cannot be the winner nor God the loser is not, after all, the course which the action of this universal drama invariably follows. It turns out that this is only one possible rendering of the plot—a rendering which depends upon the terms in which the bet is offered and taken; and there is another alternative rendering in which the denouement is that of Euripides' *Hippolytus*. There are challenges of a salutary severity that stimulates the human subject of the ordeal to a creative response; but there are also challenges of an overwhelming severity to which the human victim succumbs. In scientific terminology, 'the most stimulating challenge is to be found in a mean between a deficiency of severity and an excess of it.'¹

The meaning of this proposition has gradually unfolded itself in the long empirical process of proof. There is, however, at least one word in the formula that remains ambiguous, and this is the word 'stimulating'; for a stimulus evokes a reaction, and a reaction implies a movement in some definite direction after the stimulus has been received. What, then, is the movement towards which a

¹ For this formula see p. 260, above.

nascent civilization is stimulated by the challenge that brings it to birth? Presumably the nascent civilization is stimulated to fulfil its nature. And what is it in the nature of a new-born babe to do? When the babe has come to birth, it is in its nature to grow in wisdom and stature. Growth is what birth implies; and if our study of the geneses of civilizations has now at last reached its term, the study of the growths of civilizations still lies before us.

IS 'OLD GROUND' LESS FERTILE THAN 'NEW GROUND' INTRINSICALLY OR BY ACCIDENT?

In one passage of a foregoing chapter¹ we have examined the histories of seven civilizations of the 'related' class, each of which has comprised some 'old ground' and some 'new ground' in its domain. The upshot of this survey is that 'old ground' is apt to make a less fertile field than 'new ground' for human culture; and we have interpreted this result of empirical observation as a confirmation of the doctrine—implicit in the myths of the Exodus and the Expulsion—that the ordeal of breaking 'new ground' has an intrinsic stimulating effect. This interpretation of our empirical evidence rests on the assumption that the reason why 'old ground' is relatively sterile is because it presents a less formidable challenge to its occupants than the challenge presented by 'new ground', and therefore exerts a proportionately less powerful stimulus.² Some readers, however, may contest this explanation of the facts and may discount accordingly the value which we have placed upon this empirical evidence in our argument. Even assuming that the facts, as we have set them out in our survey, are correctly stated, our critics may submit that these facts are to be explained in another way. The explanation, they may represent, lies not in any subtle influence of the physical environment upon the behaviour of its human occupants, but in certain obvious external misfortunes which happen to have afflicted the inhabitants of certain regions in certain ages. In terms of our metaphor, the poorness of the crop in these particular fields is accounted for (according to our critics' contention) by the ravages of blight and mildew, and is therefore no evidence of any intrinsic lack of fertility in the soil. This

¹ On pp. 74-84, above.

² This assumption is borne out by two instances that have already come to our attention—one in Ceylon and the other in Central America—which stand out as exceptions to our law; for they both turn out to be exceptions that prove the underlying rule. In both Ceylon and Central America, the modern Western planters or colonists have occupied 'new ground' which had been left virgin by the pioneers of the foregoing indigenous civilizations; yet in both cases the new-comers on the 'new ground' have achieved nothing that can compare with the respective achievements of the Sinhalese and the Mayas. (For the Ceylonese case see II. D (i), pp. 6-7, above; for the Central American case see II. C (ii) (a) 2, vol. i, p. 267; and II. D (ii), pp. 35-6, above.) When we look closer, however, we observe that, in both cases, the mere 'newness' of the 'new ground' was not such a formidable—and therefore presumably not such a stimulating—factor as the inherent and perpetual challenge of Physical Nature which the 'old ground' presented. In Central America, it was less difficult for the Spanish colonists to open up the relatively dry highlands than for the Mayas to keep the jungle at bay in the rain-sodden lowlands. And in Ceylon it has been less difficult for the Scottish and English planters to clear the rain-smitten highlands than for the Sinhalese to keep the parched plains supplied with water by irrigation.

criticism deserves consideration. Let us see what our critics have to say, and what we have to say to them in reply.

Our critics are likely to open their attack by pointing out that, in several of the instances which we have brought forward, the 'old ground' which has proved sterile is ground which happens to have been overlaid by a peculiarly barbarous deposit of barbarians in the *Völkerwanderung* antecedent to the birth of the particular 'related' civilization in question. For example, at the birth of the Babylonian Civilization, Babylonia was overrun by the barbarous Kassites, while Assyria was surrounded but never quite engulfed by the Mitannians. At the birth of the Arabic Civilization, Syria was harried by the incurably barbarous Crusaders and Mongols, while the Kurdish and Turkish and Caucasian barbarians who fell upon Egypt were human wolves who proved capable of transforming themselves into human watch-dogs: the Mamlûks. At the birth of the Iranic Civilization, Transoxania and Iran were blighted by the Mongols, while the 'new ground' occupied by the Iranic Civilization in Anatolia and Hindustan was as relatively fortunate as Egypt in respect of the barbarians which fell to its lot. In Anatolia and in Hindustan, the Iranic Civilization was not only first propagated by Turkish barbarians who had been converted to Islam but was afterwards protected by them—as Egypt was protected by the Mamlûks—against the ravages of the more barbarous Mongols who followed at the Turkish barbarians' heels. Again, at the birth of the Hellenic Civilization, Crete was saddled with the 'Dorians'—barbarians whose yoke weighed so heavily upon the local descendants of the Minoans that the very name 'Minōs', which had once denoted the ruler of the seas, became the hall-mark of serfdom in the derivative 'Mnoîtēs'.¹ Naturally, it may be represented, the nascent Hellenic Civilization did not ever come to flower in this wilderness of uncivilized masters and barbarized slaves. Naturally, likewise, it did first come to flower among the descendants of those Minoan refugees who had saved themselves from enslavement by finding asylum along the Anatolian coast.

This array of facts is impressive, but it is not impregnable. To take, for instance, the contrast between the roles of Doric Crete and *ci-devant* Minoan Ionia in Hellenic history: we may retort to our critics by pointing out to them that the Cyclades, which were as free as Ionia herself from the 'Dorian' incubus, played as poor a part in Hellenic history as Doric Crete, whereas one of the first points at which Hellenism flowered in Continental European Greece was Doric Corinth. Moreover, Doric Laconia and Doric Rhodes, which flanked Doric Crete on either side, each came to play an

¹ See I. C (i) (b), Annex II, vol. i, above.

eminent part as the movement of Hellenic history developed. The case of Laconia is particularly striking, inasmuch as the likeness between Dorian institutions in Laconia and in Crete was notorious.¹ The same yoke weighed with the same weight upon the Laconian Helots as upon the Cretan Mnoitae. Yet the descendants of the Dorian conquerors of Sparta rose to a greatness which was never emulated by their kinsmen in Crete. On the hypothesis that Dorian brutality accounts for the benightedness of Hellenic Crete, these further facts are inexplicable. On the other hand, they are all intelligible on our hypothesis that the occupation of 'old ground' fails to provide a stimulus which the breaking of 'new ground' does provide. This hypothesis explains the common obscurity, in Hellenic history, of Crete and the Cyclades—the two foci of the antecedent Minoan Civilization—notwithstanding the presence in Hellenic Crete and the absence in the Hellenic Cyclades of the Dorian incubus. It also explains the common eminence, in Hellenic history, of Ionic Ionia and Attica and Doric Corinth, Laconia and Rhodes; for both Ionia and Corinth appear to have lain beyond the range of the thalassocracy of Minos, while Attica, Laconia, and Rhodes came only just within its pale.

Moreover, we may suggest that, in any *Völkerwanderung*, each invaded district is apt to get the barbarians whom it deserves, and, having got them, to bear their yoke until it earns its liberation. For instance, was it a mere external accident that, in the post-Sumeric *Völkerwanderung*, Assyria kept her head above the Mitannian flood when the waters of a Kassite domination went over Babylon's soul? Is it not more credible that Assyria managed to keep her local barbarians at bay because she offered a stouter resistance than her Babylonian neighbour; and that she offered a stouter resistance because the Assyrians had responded to some stimulus in their local environment which was not offered to the Babylonians by theirs? Again, the failure of the Mnoitae in Crete—and, for that matter, of the Helots in Laconia—to liberate themselves from the yoke of their Dorian masters was by no means a matter of course. It was only one of two possible alternative outcomes of the Dorian conquest of Crete, as is shown by the historical parallel of the Lombard conquest of Italy.

The Lombards, at the time when they overran Italy in the last convulsion of the post-Hellenic *Völkerwanderung*, were more barbarous than any other barbarian conquerors of Roman provinces in the West except the English conquerors of Britain; and their treatment of the conquered population was proportionately harsh. Though the Lombards did not go to the length of exterminating

¹ On this point, see further Part III. A, vol. iii, p. 55 below.

the native Italians, they did impose upon them a much heavier yoke than had been imposed by the Lombards' predecessors in Italy, the Ostrogoths, or by the Franks in Gaul, or even by the Vandals in Africa. Thus, at the dawn of our Western history, the situation in Italy was closely comparable to the situation that existed at the dawn of Hellenic history in Crete. An extreme reversal of fortune had placed a once imperial people under the heel of a particularly brutal barbarian master. Yet, though the situation was comparable, the outcome was completely different; for, while the Cretan Mnoïtai never recovered from the shock of their abasement and continued to bear the Dorian yoke to the end of Hellenic history, the Italian Aldi boldly and victoriously took their savage Lombard conquerors captive.¹ They converted the Lombards from their Arian heresy to the Catholic Faith; they taught them to discard their Teutonic vernacular for the Italian language; and by such means they succeeded, within four or five centuries of the Lombard conquest, in transforming an unsocial aggregation of serfs and masters into a single people, abounding in energy and morally fit to take the leading part in the next act of the drama of Western history. This evidence proves that a calamity like the Lombard conquest of Italy or the Dorian conquest of Crete is by no means bound to blight for ever the prospects of the region upon which it descends. While the history of Dorian Crete shows that this may be the effect, the history of Lombard Italy shows not less clearly that the effect may equally well be just the opposite.

Finally we can refute our critics by joining issue with them on the field of Orthodox Christian history; for here it is impossible to adduce any evidence for a special extraneous calamity, exclusively afflicting the 'old ground' in the Orthodox Christian domain, which might be held to account for this 'old ground's' relative sterility. It is true that, in the domain of Orthodox Christendom, the 'old ground'—that is, the Aegean area—was visited by the twin calamity of Slav invasions overland and Arab raids by sea; but the same visitations fell much more severely upon the two pieces of 'new ground' in which Orthodox Christendom successively found its centre of gravity. The brunt of the Arab offensive was borne by Eastern and Central Anatolia, from the Taurus to Amorium; the brunt of the Slav invasions was borne by the interior of the Balkan Peninsula from the Danube to Salonica. The bands of Slavonic invaders that penetrated beyond Salonica into Peninsular Greece were forlorn hopes; the Arab sea-raids were 'side shows' compared to the Arab land operations. Thus it will be seen that, in Orthodox Christendom, the 'old ground' was afflicted not more but less

¹ Horace: *Epistolae*, II, Ep. i, l. 156.

grievously than the 'new ground' by these barbarian blights; yet in Orthodox Christian history—just as in Babylonian and Hindu and Arabic and Iranian and Hellenic and Sinic history—the 'old ground' has proved less fertile than the new.

Perhaps our thesis that 'old ground' is less fertile than 'new ground' intrinsically and not by accident has now been sufficiently vindicated against the criticism to which it might seem, at first sight, to be exposed.

ANNEX TO II. D (v)

HISTORIC SIEGES AND THEIR AFTER-EFFECTS

CITIES, like ships, are readily personified by the human imagination; and their greatness depends, not merely upon immediate practical values which can be expressed statistically, but also always to some extent, and often to a far greater extent, upon an imponderable prestige which is created and sustained by an emotional consciousness of their historic trials and triumphs. In many cases it is possible to trace the origin of this prestige to certain particular outstanding ordeals; and the prestige of Vienna is a case in point. It is manifestly founded upon the successful resistance of Vienna to the Ottoman assaults of A.D. 1529 and A.D. 1682-3.

A city's resistance, however, need not be successful in order to win the reverence and affection of later generations. For example, the prestige of Moscow is founded upon the passive endurance of the city on two occasions when she has fallen, without serious military resistance, under the heel of a Western invader: a Polish invader in 1610-12 and a French in 1812. On the other hand, the prestige of Constantinople in Orthodox Christendom, like that of Vienna in the Western World, is founded on a series of successful resistances: to the Persians and Avars in A.D. 626 (a supreme crisis which is commemorated, down to this day, in the Liturgy of the Orthodox Church, in the *'Ακάθιστος Ύμνος*); to the Arabs in A.D. 673-7; and to the Arabs again in A.D. 717-18. The prestige of Constantinople, like that of Vienna and unlike that of Moscow, is bound up with the concept of inviolability; and it has suffered from the Latin conquest of A.D. 1204 and the Ottoman conquest of 1453, as the prestige of Vienna has suffered from the French occupations of 1805 and 1809. In contrast to Constantinople and Vienna, Rome and Paris and London, all three, owe their present eminence, as the respective capitals of Italy, France, and England, to prestige gained by them in ordeals in which they have made an heroic resistance but have not remained inviolate.

How was it that Rome achieved the *tour de force* of becoming the capital of the new Kingdom of Italy in preference to Turin, a city which enjoyed the practical advantage of being the capital of the particular Italian State that was the instrument of national unification, and likewise in preference to Milan, a city which enjoyed the practical advantage of being the industrial centre of the Italian Peninsula? These practical considerations telling in favour of Milan or Turin would hardly have been overridden, in favour of

Rome, on the strength of historical sentiment pure and simple, if Rome had not identified herself, in the hearts and minds of the Italian people, with the Risorgimento of Italy by standing siege from the French in 1849. So far from Rome suffering any loss of prestige through the fact that her resistance to her besiegers on this occasion was unsuccessful, she gained her prestige in 1849 in virtue of the very fact that her resistance was a forlorn hope. She rejected the summons to capitulate with the clear foreknowledge that her fall was inevitable; for by that time the Italian national uprising of 1848 had already suffered defeat in almost every other quarter; the reaction was in the ascendant all over the European Continent; and the reactionary forces which were being concentrated upon Rome were overwhelming. Rome's heroic gesture in making this last and hopeless stand against overwhelming odds in 1849 was just what appealed to the Italian national imagination.

As for the prestige of Paris and London, which was won a thousand years earlier than the prestige of modern Rome in the utterly different ordeal of the Scandinavian *Völkerwanderung*, inviolability was not of its essence either. In fact, at the first encounter with the Vikings, both London and Paris were ignominiously taken by assault and pillaged: London in A.D. 842; Paris in 845. London was actually ceded to the invaders by Alfred under the Treaty of Wedmore in A.D. 878 and remained for seven years in their hands. The two cities emerged from their ordeal with a new and enduring prestige not because they never fell but because they fell only to rise again and oppose a firmer resistance to the invader. As the ordeal continued, this resistance became indefatigable. The Vikings never succeeded in forcing their way above Paris up the Seine or above London up the Thames; and either city crowned its long endurance with a final feat of arms which made a permanent impress upon the national imagination: Paris with her successful resistance to the great siege of A.D. 885-6; London with her successful barrage of the Thames in A.D. 895.

ANNEX TO II. D (vi)

JEWS IN FASTNESSES

IN the relevant chapter,¹ we have drawn attention to the fact that the fossils of extinct civilizations are found in two distinct situations—in 'dispersion' and in 'fastnesses'—and we have observed that these situations are not only different but are in sharp contrast with one another. The most familiar example of a fossil in dispersion is the Jewish 'Diasporà'. On the other hand, it is perhaps not so well known that there are other Jewish communities that have survived in fastnesses down to the present day. The contrast between the *ethos* of these Jews in fastnesses and the *ethos* of the Jewish 'Diasporà' is extreme; and some description, in greater detail, of extant 'Jews in fastnesses' may therefore be of interest.

In this connexion it may be recalled that Judaism is a fossil of the extinct Syriac Civilization, and that the successive religions which the Syriac Civilization begot in the course of its history all arose, in turn, in the heart of the Syriac World, and all radiated out from the centre, in every direction, towards the circumference. The result has been not unlike what happens when a child throws one stone after another into the middle of a pond. When several stones have been thrown in succession, the surface of the pond displays a pattern of several concentric circular waves which are all travelling outwards from the centre towards the circumference simultaneously. The outermost of these expanding circles is the product of the first stone thrown in; the wave raised by the second stone forms the second circle which is expanding in the first circle's wake; and so on—each wave that has travelled a shorter distance from the centre being the product of a stone which has been thrown into the pond at a later moment of time. On this pattern, the religions successively begotten by the Syriac Civilization have expanded in concentric circles from the heart of the Syriac World: Jewry and Christianity and Islam from Syria and the Hijāz; Zoroastrianism and Shi'ism from Iran. The Jewish-Zoroastrian wave, being the earliest, is the outermost; the Christian wave has followed in its wake; the Islamic wave is the innermost and the latest.²

Of course, at the present day, some thirteen centuries after the date when even the youngest of these waves was originally launched,

¹ See II. D (vi), pp. 256-9, above.

² This refraction of Syriac religion into a series of successive waves is a consequence of the impact of Hellenism upon the Syriac World. (See II. D (vi), pp. 234-5, and II. D (vii), pp. 285-8, above, and Part IX, below.) The boy who threw the first stone of Hellenism into the Syriac pond was Alexander of Macedon.

the pattern of concentric circles has lost its regularity. The Jewish-Zoroastrian wave has mostly dissolved into spray which has scattered itself all over the World in the form of a diaspora. As for the Christian wave, certain sectors of its circle—e.g. the Orthodox sector and the Western (now broken up into a Catholic fraction and a Protestant)—have swollen to unexpected dimensions, while other sectors—e.g. the Nestorian and the Monophysite—have shared the fate of the Jewish-Zoroastrian wave ahead of them. Only the Islamic wave still clearly retains its original formation. It needs the discerning eye of a historical geographer to reconstruct the original pattern of the whole series of waves from the present state of the map; and the materials for reconstruction would have been altogether insufficient but for the existence of certain rocks and reefs on which the waves, in breaking, have thrown up fragments of jetsam which have provided a permanent record of their passage. These rocks are the fastnesses in which fossils have been preserved in a state of fixity thanks to their isolation from the moving and changing world outside.

On the periphery of the Syriac World, there are two notable fastnesses of the kind: on the south, Abyssinia with its outwork the Yaman; on the north, the Caucasus with its annex the Crimea.¹ If we examine the present human fauna of either of these fastnesses, we shall find in either place a Jewish fossil still preserved in the inmost recesses and a more recently deposited Christian fossil surrounding the Jewish fossil and embedding it. In either place, again, we shall see the Islamic wave—the youngest and innermost wave of the three—washing round the foot of the rock, occasionally beating tempestuously against its flanks, and ever seeking to submerge it from base to pinnacle.

In Abyssinia, the local Jewish fossil—the Jewish community known as the Falasha—occupies the central district of Semyen: the highest highlands of the Abyssinian Plateau. The Jewish highlanders of Semyen are entirely surrounded by Abyssinian Monophysite Christians, who occupy all the rest of the plateau from the bounds of Semyen to the edge of the escarpment. The lowlands adjoining the plateau on the north and on the east are inhabited by Muslims—the foot of the Abyssinian escarpment constituting the limit of the Islamic domain in this direction.²

Similarly, in the Caucasus, the habitat of the local Jewish fossil—the so-called 'Mountain Jews'—is Daghestan (i.e. 'the Highlands'

¹ For a former Jewish fastness on the west, in the Maghrib, which held out till A.D. 1492, see Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot), p. 200. Cf. op. cit., 415-16.

² See the map on p. 111 of *A Handbook of Abyssinia*, vol. 1: General (London 1917, H.M. Stationery Office).

par excellence), a district which may be regarded as the innermost recess of all Caucasia. The local Christian fossils—Georgian Orthodox Christians in the basins of the Rion and the Kur, and Armenian Monophysites on the plateau south of Georgia—occupy more exposed positions. As for the Muslims, they have penetrated into the Caucasus more deeply than they have succeeded in penetrating into Abyssinia up to the present, so that the Mountain Jews of the Caucasus find themselves embedded to-day in a non-Jewish population which is not Christian but Muslim.

As regards the outwork of Abyssinia in the Yaman and the annex of the Caucasus in the Crimea, it is noteworthy that in both places Jewish fossils have survived, while the more recently deposited Christian fossils, which were once to be found there, are now no longer extant. The Nestorian Christendom of the Yaman did not survive the first impact of Islam; and the indigenous Orthodox Christendom of the Crimea¹ is extinct to-day, though it was extant no longer ago than the sixteenth century of the Christian Era.² On

¹ As distinct from the Russian Orthodox Christendom which has been introduced into the Crimea, by Russian colonization, since the annexation of the Crimea to the Russian Empire in A.D. 1783.

² The indigenous Orthodox Christendom of the Crimea was originally represented by two communities: the Greeks of Cherson, on the site now occupied by the modern Russian foundation of Sebastopol near the southern corner of the peninsula; and the Crimean and Tetraxite Goths, who occupied respectively the eastern end of the Crimean mountains and the western end of the Caucasus Range, on opposite sides of the Straits of Kertch. These Goths were jetsam from the *Völkerwanderung* which had carried the main body of their kinsmen not only from the shores of the Baltic to the shores of the Black Sea, but on and beyond from the shores of the Black Sea to the shores of the Mediterranean and the Atlantic. The Crimean and Tetraxite Goths had been left behind at the first halting-place on the long trek which the Visigoths and the Ostrogoths continued to the bitter end. When the main body went west and was straightway consumed in the holocaust of the Roman Empire like a moth that flies into a candle-flame, the lost Gothic rear-guard in the Crimea lived on in obscurity in this fastness for another millennium. The last descendants of these Crimean Goths were found surviving by the Flemish scholar and traveller Busbecq in the middle of the sixteenth century, when he was the Ambassador of the Hapsburg Monarchy at the Sublime Porte. In the fourth and last of his famous Turkish Letters, he describes an interview with two envoys from these Crimean Goths who had come on official business to the Ottoman Imperial Government at Constantinople, and he gives a short vocabulary of their language, which he recognizes to be Teutonic. As for Cherson, it was not only a representative of Orthodox Christendom but a fossil of the Hellenic Society in its pristine state. Cherson was the last survivor of the hundreds of sovereign independent city-states into which the Hellenic World had been articulated before it was unified politically in the Roman Empire. Cherson, alone, had become an ally of Rome without ever losing its autonomy, and it also survived the post-Hellenic *Völkerwanderung* in which the Roman Empire broke up. In fact, Cherson lived on as a sovereign city-state on the old Hellenic pattern until the East Roman Empire—a resuscitation of the Roman Empire in the Orthodox Christian World—annexed Cherson outright in the ninth century of the Christian Era. Thus the mountainous southern portion of the Crimea has provided fastnesses not only for Orthodox Christendom and Jewry but for the North European external proletariat of the Hellenic Society as represented by the rear-guard of the Goths, and the Hellenic city-state as represented by Cherson. At the same time, the flat and lowlying northern portion of the Crimea has repeatedly provided an asylum for Nomadic peoples who have been driven off the Great Eurasian Steppe by more powerful hordes of their own kind, but have managed to hold their own on the miniature Crimean Steppe to the south of the Isthmus of Perekop. The Thracian-speaking Taurians, the Iranian-speaking Scythians, and the Turkish-speaking Khazars and Tatars are examples of *ci-devant* masters of the Eurasian Steppe who managed to survive in the Crimea for some centuries after they had been trampled out of

the other hand, the Yamanī Jews have managed—under great and apparently increasing pressure from the local Muslims who have occupied the place of the former local Christians and pagans since the seventh century—to maintain themselves in existence down to the present day, when the remnant is gradually being evacuated from the Yaman to Palestine by Zionist enterprise. As for the Jewish fossil in the Crimea, it is represented—and this likewise down to the present day—by two separate Jewish communities: the Krimchaks, who are Talmudists, and the anti-Talmudist Qara'im.

Thus the original pattern of concentric Jewish and Christian and Islamic waves is preserved by the Jewish and Christian jetsam that has remained stranded in the fastnesses of Abyssinia and the Yaman and the Caucasus and the Crimea, while the tide of Islam has filled the vast intervening area and has flooded round the bases and up into the gateways of the fastnesses themselves.¹

existence everywhere else. The Khazars who survived in the Crimea after the destruction of the Khazar Empire on the Eurasian Steppe in the eleventh century of the Christian Era are believed to be the ancestors of the Krimchak Jews.

¹ This pattern of concentric waves, representing the expansion, from a common centre, of successive religious movements, is not a unique and peculiar product of the Syriac Civilization. We have observed already (on pp. 234-5 and 285-8, above) that the refraction of Syriac religion into separate and successive and sometimes conflicting waves is an outcome of the collision between the Syriac Civilization and the Hellenic Civilization. We have also observed (vol. i, on pp. 85-6 and 91-2, in I. C (i) (b), above) that the Syriac Civilization was not the only civilization which the impact of the Hellenic Society deflected from its natural course. This experience of the Syriac Civilization was shared by the Indic Civilization; and if we now glance at the historical geography of the religious movements that have emanated from the ancient Indic World, we shall find analogous traces of an identical pattern of successive concentric waves.

In this Indic pattern, the oldest and outermost wave—corresponding to the Jewish-Zoroastrian wave in the Syriac pattern—is represented by the Primitive or Hinayanian Buddhism which survives down to the present day on what used to be the southern sector of the periphery of the ancient Indic World in Ceylon and Burma and Siam, and which was once to be found likewise on the northern sector of the same periphery, in the Tarim Basin. This first wave is likewise represented by Jainism, which still survives in dispersion nearer the heart of the ancient Indic World, in continental India. This Jainism and Hinayanian Buddhism are fossils of Indic religion as it was before the Hellenic impact, just as Zoroastrianism and Judaism are fossils of Syriac religion as it was before the Hellenic impact. The next wave in the Indic pattern—corresponding to the Christian wave in the Syriac pattern—is represented by the Later or Mahayanian Buddhism, which, like Christianity, is a syncretism between the indigenous culture and the intrusive Hellenism; and this Mahayanian wave, like the Christian wave, again, has developed a marked irregularity of form. What was originally its north-western sector has completely disappeared in Afghanistan and in the Oxus-Jaxartes Basin, which were the first stages on its course of expansion; and it has also disappeared in the Tarim Basin, where it followed and effaced the Primitive Buddhism of the Hinayana. On the other hand, this north-western sector of the Mahayanian Buddhist wave has swollen to unexpected proportions in its final resting-place in the Far East, which it has reached at the end of a journey that has carried it, in a sharply curving track, round the southern and western and northern foot of the Tibetan Plateau. As for the north-eastern sector of the Mahayanian wave, which is constituted by the Tantric or Lamaistic variety of Mahayanian Buddhism, this has spread from Bengal to Tibet and thence to Mongolia—Tibet and Mongolia being the places where it survives to-day. It will be seen that the Lamaistic Mahayanian Buddhism corresponds to the Monophysite-Nestorian sector of the Christian wave, and the Far Eastern Mahayanian Buddhism to the Western sector. Finally, while the Mahayanian Buddhism, in its two extant varieties, constitutes the middle wave in the Indic pattern, the latest and innermost wave is represented here by Hinduism, which—like Islam in the Syriac pattern—now occupies the central position and still clearly retains its original formation. It will be seen that Hinduism also resembles Islam in

If we now concentrate our attention upon the Jews in fastnesses, who have been deposited there by the expansion of the oldest and outermost of the three concentric waves, we shall find that in physique and language and culture these Jews have far more in common with the pagans and Christians and Muslims with whom they share their asylum than they have in common with Jews elsewhere. It is to be inferred that Judaism, like its successors Christianity and Islam, has propagated itself by the process of conversion as well as by the process of migration. At any rate among the Jews in fastnesses, the predominant element in the life and in the blood of the community seems to be the contribution of the indigenous proselytes.

In Abyssinia, for instance, 'the Falasha are Hamites by race and Jews only by religion'.¹ They 'are in general darker and more corpulent than the Amharas, among whom they live. Their hair is shorter and often curly; their eyes are smaller and their faces not so long'.² They 'have no language of their own, but speak various Agau dialects'.³ 'They are ignorant of Hebrew, but possess in Ge'ez the canonical and apocryphal books of the Old Testament' and various other religious works.⁴ 'They know nothing of the Babylonian and Jerusalem Talmud, composed during and after the Captivity respectively, and do not observe the feast of Purim, i.e. the dedication of the post-Exilic Temple'.⁵ 'Their Judaism does not exclude a very strong tincture of paganism. . . . Especially curious is their worship of Sanbat, the Goddess of Sabbath'.⁶

From its origins down to the end of the eighteenth century of the Christian Era, this Falasha Jewish community seems to have lived a life of warlike independence in its highland fastness of Semyen. This community 'consolidated itself into an independent Kingdom in Semyen at the time of the conversion of Abyssinia [to Monophysite Christianity]. In [A.D.] 937 Judith, queen of Semyen in her own right, murdered the whole [Christian] royal family of Axum, with the exception of one child who was conveyed to Shoa, and usurped the throne. In 977 she was succeeded by her daughter, who was deposed a few months later by a prince of the house of

standing for the ultimate victorious reaction by which the indigenous culture eventually drove the intrusive Hellenism out. If we may venture to pursue our parallel still farther, we may also perceive Indic analogues of the Syriac fastnesses. The Plateau of Tibet, which gives asylum to the Lamaistic Mahayanian Buddhism, plays the part of the Caucasus; the highlands of Ceylon, which give asylum to the Hinayanian Buddhism, play the part of Abyssinia. (The historical geography of the Indic and the Syriac religions is examined at greater length in Part IX, below, apropos of the contacts between civilizations in Space.)

Zagwe. The dynasty founded by this prince was at first perhaps Jewish but later Christian.¹ Thereafter, in Semyen, the Falasha maintained their independence in periodic warfare with the surrounding Christians; but 'their line of kings became extinct about 1800, when the Falasha became subject to Tigre'.²

During the last century and a half, under the new conditions of subjection of Christian rule, the Falasha seem to have entered on a process of transformation from a fossil in a fastness into a fossil in dispersion. They still 'live mostly in Semyen in villages of their own',³ and 'agriculture is' still 'their chief occupation'.⁴ At the same time, members of the Falasha community are now dispersed abroad in other parts of Abyssinia, and in this situation they are already displaying the characteristic traits of a penalized religious minority. 'If resident in a Christian or Muhammadan town', they 'occupy a separate quarter. They do not mix with the Abyssinians; indeed, they are forbidden to enter the house of a Christian and never marry the women of other religions. Polygamy is unknown; early marriages are rare; and the moral standard is superior to that of the Abyssinians'.⁵ 'They are fanatical in observing the Sabbath, the circumcision of both sexes, certain fasts, and several festivals, annual and monthly. They are scrupulous in following the laws of purification by means of baths and ablutions'.⁶ Moreover, 'they excel in all trades. In their eyes work is not, as it is, for example, in the eyes of the Shoans, the attribute of serfs and slaves. They are cultivators, smiths, masons, architects, ebony-workers, weavers, potters, and so on. We have seen them, in the course of this history [of Abyssinia], forming regular centres of almost constant rebellion. For more than a century past, however, they have no longer made themselves notorious. Their skill in manual work leads to their being exploited by the chiefs and even maltreated—treated, in fact, as an inferior race'.⁷ Evidently the Falasha who are now dispersed abroad in Abyssinia beyond the confines of their native fastness in Semyen are rapidly approximating towards the well-known type of the Jewish 'Diaspora'. As yet, however, the approximation is imperfect; for although they 'ply the trades' and 'make the articles necessary for the home or the field', they still 'reject commerce'.⁸

The modern history of the neighbouring Jewish community in the Yaman has run a parallel course. 'At the beginning of the 19th century, the condition of the Jews of Yaman was miserable. . . . They were prohibited . . . from engaging in money transactions and

were all mechanics, being employed chiefly as carpenters, masons, and smiths. . . . The chief industry of the Jews of Yaman is the making of pottery, which is found in all their settlements and which has rendered them famous throughout the East.¹

If we turn now to the Caucasus, we shall find the same phenomena as in Abyssinia. In physical race, the 'Mountain Jews' of Daghestan, like the Falasha of Semyen, are of one blood with the non-Jewish peoples round about them. Socially, they are an agricultural community which is just beginning to migrate into the towns and to take up some of the occupations which are characteristic, elsewhere, of the Jewish 'Diaspora'—though in the Caucasus this tendency does not seem to have gone so far as in Abyssinia up to the present.

The racial character of the Caucasian Jews is clearly described by a Jewish authority in the following passage:²

'The Jews of the Caucasus are very interesting. Historically it has been proven that they have been there for more than two thousand years. They claim that they are the descendants of those ubiquitous Ten Lost Tribes, and many missionaries are inclined to believe them. The most curious, both from an anthropological and ethnological standpoint, are the Mountain Jews of Daghestan. They have diverged completely from the ethnic type of the Jews in every other country. According to the measurements obtained recently by Kurdoff, they are tall, averaging 166.0 cm. in height, and 57 per cent. of them were above the average height. Very few blonds are met with among them, 87 per cent. have both dark hair and eyes. Their head-form is hyperbrachycephalic, the average cephalic index being 86.35, and not one dolichocephalic individual was found among 160 measured by Kurdoff. Their face is broad, the forehead straight, the aperture of the eye horizontal; the cheek-bone being somewhat protruding, the nose straight and of medium size; only thirty per cent. have "Semitic" noses. The mouth is broad, the lips thick, and the ears large. That author concludes that the Daghestan mountain Jews are physically far removed from all other Jews, and have nothing in common with them. They are a product of mixture of the mountain tribes of Daghestan on the one hand, and some other races, especially the Kirghiz Mongolians, on the other.³ Their language, dress, and manners are the same as those of the other mountaineers among whom they live. All who have observed these Jews agree that they are of a totally different type from the one generally known as "Jewish". It is impossible to distinguish them from the Tats, Lesghians, and Circassians, among whom they live, says one who has studied the races of the Caucasus,⁴ and most other ethnologists agree with this view.'

As for the social life of the Caucasian Jews—their occupations and institutions and *éthos*—it will be sufficient to quote a passage from one of the leading modern Western authorities on the Caucasian peoples:¹

'One principal reason for the incompleteness of earlier works about the Mountain Jews of the Caucasus is to be found in the fanaticism and exclusiveness which these Jews display towards other Jews. They have a mass of religious usages and articles of faith which to European Jews are entirely unknown; above all, they are zealous adherents of the Talmud. Their hatred of other Jews was still further accentuated by the fact that, after the conquest of the Caucasus, the Jewish soldiers from Russia, who were hospitably received by the Mountain Jews as co-religionists, chose to nickname their hosts "oxen"—a nickname which persists down to this day—on account of the roughness and grossness of their manners. The extent of the enmity between the two is best shown by a saying current among the Mountain Jews: "Don't kill an Ashkenazi by cutting his throat; stab him in the neck to prolong the agony." There have been a number of bloody encounters between these two Jewish races. . . .

'The Mountain Jews are mostly dispersed up and down Daghestan and the Terek District; and, in consonance with their principal occupations, their settlements are located on the alps or in the gorges or on the slopes of the mountains. Their auls are in some cases dispersed among the auls of other tribes, in some cases segregated from them, while there are places where they live cheek by jowl with the natives. In general, with few exceptions, they live in a good understanding with the natives. It is not uncommon for a Jew to contract a close friendship with a Musulman and to become, after the exchange of the kiss of friendship, his life-long *kardash* [brother]. In this rite the parties exchange weapons and contract a solemn mutual obligation to stand by one another, in time of stress, till they have shed their last drop of blood in their comrade's defence. . . .

'A considerable section of the Mountain Jews live in the towns and devote themselves to trade and business. Those who live in the auls are predominantly agriculturists. They cultivate wheat, barley, rice, tobacco, fruit, and vines, as well as vegetables. A small section are artisans and make morocco leather. . . .

'The attitude of the Mountain Jews towards European education is very hostile; and so it is no wonder that in the auls one often finds hardly two or three people who can read and write. The reason for this is fanaticism. There is a fear that those who acquire some learning may become apostates. It is only lately that the children are being sent to school, and the number of illiterates has already come down to something like 85 per cent. On the other hand, the number of those who attend the higher schools in order to acquire a rabbi's diploma amounts to only 1 per cent. The Mountain Jew mostly lives by the work of his

¹ Hahn, C.: *op. cit.*, ch. vi: 'Die Juden in den Kaukasischen Bergen'.

own hands, and he needs his children's help, so that the children have no time for school. . . .

'When we come to the physiognomy of the Mountain Jews, we have to observe that the Semitic type has been substantially modified by mixture with the native peoples of the Caucasus. . . . The Mountain Jew resembles the Lesghian, Chechen, and Circassian, and even the Armenian, much more than he resembles the European Jew. . . .

'The character and occupation of the Mountain Jew is profoundly influenced by his physical environment. Here we see him, armed *cap-à-pie*, riding past us on a handsome charger; there we see him, in old ragged clothes, clambering up the mountain-track in order to hew stumps or dig up the roots of trees and bushes to be carried home on bended back; here again we see him digging the ground, ploughing, making wine, gathering in his fruit crop or perhaps standing in a tub by the spring and stamping out raw hides. . . .

The two Jewish communities in the Crimea differ from one another in their theology and also, apparently, in their racial origin. The 'Krimchaks', who are Talmudists, are believed to be descended from the Khazars: a Turkish-speaking Nomadic people who erupted from the depths of the Eurasian Steppe in the latter part of the sixth century of the Christian Era; found themselves new pastures between the Lower Volga and the Lower Don; made themselves the dominant power between the Caucasus and the Urals and the Russian forest and the Black Sea; and eventually became converts to Judaism—probably in the eighth century of the Christian Era, more than two hundred years before the White Bulgars on the Middle Volga were converted to Islam or the Russians on the Upper Dniepr to Orthodox Christianity. The Krimchaks are believed to be descendants of a remnant of the Khazars who found asylum in the Crimea¹ after they had been driven off the main steppe in the eleventh century, partly by the Russians and partly by a fresh eruption of kindred Turkish-speaking Nomadic tribes (Ghuzz and Cuman or Qipchāq) from the heart of Eurasia.²

'Krimchaks: the so-called "Turkish Jews", inhabitants of the Crimea, whose centre of population is Qara-Su-Bazar, one of the most densely populated districts of Taurida. They differ from the other Jews of Russia in that the Semitic and Tatar elements are in them intimately blended. In their mode of life, they greatly resemble their Tatar neighbours, but in religion they adhere strictly to the Jewish faith, even to Talmudic Judaism. Their dress is identical with that of the Tatars. . . . The men are almost all of tall stature and slenderly built, and are marked by the reddish-golden colour of their hair, a tint which is uncommon among Semitic tribes. The women have retained more tenaciously the

¹ 'Many intermingled in the Crimea with the local Jews; the Krimchaki are probably their descendants' (*The Jewish Encyclopaedia*, s.v. 'Khazars').

² See the second footnote on p. 404, above.

characteristically Jewish type. . . . The houses of the Krimchaks are built in the usual Tatar style. . . . The Krimchaks employ a pure Tatar language, but use the Hebrew Alphabet in writing.¹

The other Jewish community in the Crimea are the anti-Talmudist Karaites (Qara'im: i.e. readers of the Law and the Prophets as opposed to the commentaries upon them). The Karaite Sect appears to have arisen somewhere near the centre of the Syriac World—perhaps in Northern Persia—in the eighth century of the Christian Era, after the reintegration and resumption of the Syriac universal state in the Arab Caliphate.² In its Syriac homelands, the Karaite Movement attained its zenith in the tenth and eleventh centuries of the Christian Era. Thereafter, in the Syriac World, and in the new Arabic and Iranic worlds which arose on its ruins, Talmudic orthodoxy began to regain its ascendancy among the local Jewry, and the Karaites went out in search of new worlds to conquer. In the twelfth and thirteenth centuries, they were able to offset their losses among the Jews of Dār-al-Islām by gaining ground among the Jews in the main body of the Orthodox Christian World and the Jews in the Crimea and on the adjoining stretches of the main body of the Eurasian Steppe. Of the Karaites who established themselves on the north side of the Black Sea, some were transplanted to Troki in Lithuania by the Lithuanian conqueror Witold the Great (*regnabat* A.D. 1392–1430).³ Others remained in their Crimean fastness, which is described in the following passage from the work of one of the earliest travellers with a Western scientific outlook that visited the Crimea on the morrow of the modern Russian conquest of the peninsula:⁴

'At three versts' distance, as the crow flies, from the upper part of Baghcheserai, at the entry of the gorge where the Juruk-su⁵ rises, one reaches the fastness of the Jews: Jufut-Qal'eh. It is situated at the junction of the gorge with another valley, on a high limestone mountain which juts out between the two ravines. . . . One climbs up to the fortress by a path used for carrying water on donkey-back (in little barrels, slung pannier-wise, at a charge of ten kopeks). Outside the town, at the entry of the valley, one sees the cemetery of the Jews, shaded by magnificent trees and covered with rows of tombs. . . . The Jews have such veneration for this Valley of Jehoshaphat that at one time, whenever the Khans wanted to make a levy on the Jews, they were sure of obtaining from them whatever sum they demanded by the threat of felling the trees surrounding

⁵ Choraq-su?

the Jewish cemetery, on the pretext that they needed the timber. The Jewish town is situated on the narrowest part of the salient of the mountain and is fenced in by walls and by houses. It has two outer gates, which are shut every evening: one at the peak of the crag; the other at the point where the ridge spreads out into a plateau. The streets are narrow and tortuous but very clean. The rock itself serves for paving, but the principal streets have side-walks for the convenience of the inhabitants. In the centre of the town one sees a third gate which indicates the limit of the town's original area and gives a measure of the extent to which it has grown. One observes in the vicinity the mausoleum of a daughter of Toqatmysh Khan. . . . The Synagogue, which is a fine piece of architecture, possesses a little garden which serves for the Feast of Tabernacles. All the courtyards are surrounded, in the Tatar fashion, with high walls built of undressed limestone and clay. The houses, which are built in continuous blocks, number about two hundred and are inhabited by twelve hundred persons of both sexes, who are all Karaïtes. These Jews still use the name Qara'im among themselves, and do not admit the orthodoxy of any other Jews except the Polish Karaïtes who agree with them in rejecting the Talmud. They also import their bibles from Poland; but they have almost entirely adopted the ancient costume and language of the Tatars, because they have been living under the domination of that people from time immemorial, from the produce of their commerce, manufactures and trades.'

This brief survey may give some notion of the great gulf in race, occupation, and *ethos* which divides the little-known Jews in fastnesses from the well-known Jews in dispersion.

ANNEX I TO II. D (vii)

DR. ELLSWORTH HUNTINGTON'S APPLICATION OF HIS CLIMATE-AND-CIVILIZATION THEORY TO THE HISTORIES OF THE MAYAN AND YUCATEC CIVILIZATIONS IN CENTRAL AMERICA AND TO THE HISTORY OF THE SYRIAC CIVILIZATION IN THE OASES OF THE NORTH ARABIAN STEPPE

It will be evident to any reader of this Study that the writer of it has the greatest admiration for Dr. Ellsworth Huntington and his work; and it is with considerable diffidence that the writer now ventures upon a criticism of Dr. Huntington's views on one particular point. He therefore wishes to preface this criticism by noting that the point in question does not touch the substance of Dr. Huntington's theory: the theory, that is to say, that the fluctuations in the fortunes of civilizations are in some cases and to some extent connected with variations in climate arising from a periodic shifting of climatic zones. The criticism refers to two only out of a very large number of applications of this theory which Dr. Huntington has made; and the present critic will seek to show that, in these two particular applications, Dr. Huntington is (no doubt, unintentionally) departing from his own theory in effect, instead of supporting it.

With Dr. Huntington's main positions, as he understands them, the writer of this Study profoundly agrees.

He recognizes that Dr. Huntington—with the just sense of proportion which is characteristic of big minds—avoids the mental pitfall of ascribing exclusive or even paramount efficacy to the particular factors which happen to have been the object of the scholar's own researches. Dr. Huntington perceives and declares that, in human affairs, the efficacy of spiritual factors is primary and the efficacy of climatic and other physical factors secondary.¹ And, in the sphere of application which he assigns to the climatic factor, he generally portrays this factor as acting upon human life, not in a mechanical, *a priori*, necessitarian way, but in the form of a stimulus. Indeed, a sentence in which Dr. Huntington sums up this view of the relation between climate and civilization has been quoted in an earlier passage of this Study as one in a series of illustrations of the action of Challenge-and-Response. 'A relatively high degree of storminess and a relatively long duration of the season of cyclonic

¹ See, for example, his *The Climatic Factor as illustrated in Arid America* (Washington 1914, Carnegie Institution of Washington, Publication No. 192), p. 226.

storms have apparently been characteristic of the places where civilization has risen to high levels both in the past and at present.¹

Moreover, in the present Study, Dr. Huntington's special climatic theory of the periodic shifting of climatic zones has been accepted as supplying the key to the geneses of three civilizations—the Nomadic, Egyptian, and Sumeric—on the assumption that a desiccation of the former Afrasian Savannah into the present Afrasian Steppe has presented the human inhabitants of this region with a common challenge that has evoked several alternative responses.²

Dr. Huntington goes on, however, to apply this same special theory of the shifting of climatic zones to explain the rises and falls of the Mayan and Yucatec civilizations in Central America and the Syriac Civilization in the oases of the North Arabian Steppe; and it is in regard to these two applications that the writer of this Study finds himself unable to see eye to eye with Dr. Huntington altogether.

Stated briefly, the theory of the shifting of climatic zones supposes that two things are constant from age to age—in the first place, the amount of water existing on the surface of the planet, and in the second place the nature and relative position of the successive zones of climate that encircle the globe latitudinally—while one thing varies periodically, this variable being the absolute positions of the boundaries between the same three successive zones as measured by their respective distances, at different times, from the Equator on the one hand and from the Pole on the other. This periodic variation in the absolute positions of the zones is ascribed to a periodic shifting of the track of the cyclonic storms, these storms being the climatic agency (as distinct from the astronomical factors involved) to which the differentiation of the face of the planet into this series of climatic zones is ultimately due.

In order to grasp the application of this meteorological theory to human affairs, we must remind ourselves of the respective characteristics of the successive climatic zones which always retain their relative positions but periodically change their absolute positions on this view. Proceeding from the Equator towards the Pole, the first zone is a tropical zone of drenching rain and rank vegetation; the second is a sub-tropical zone of drought and barrenness; the third is a temperate zone of moderate humidity and moderate fertility (the succeeding sub-arctic and arctic zones do not concern us here). From the human standpoint, the temperate zone offers Mankind the climatic and vegetational golden mean; the sub-

¹ Huntington, E.: *Civilization and Climate*, 3rd ed. (New Haven 1924, Yale University Press), p. 12, quoted above in II. C (ii) (b) 1, vol. i, on p. 278.

² See II. C (ii) (b) 2, vol. i, pp. 304-6, above.

tropical zone challenges Man by offering him less moisture and less vegetation than he requires; and the tropical zone challenges him equally severely by offering him an *embarras de richesse* in both these commodities.

Assuming the truth of the hypothesis that the absolute positions of these three zones periodically shift, it is obvious that there are two sets of regions—one along the borderline between the tropical and the sub-tropical zone, and the other along the borderline between the sub-tropical and the temperate zone—which must be periodically changing their climate in an alternation between one of two different climates and the other. And this periodic alternation of climates in any given area will obviously affect the character of this area as a physical environment for human life. Confining our attention, for present purposes, to the Northern Hemisphere, we shall observe that, when the whole series of latitudinally parallel zones shifts southward, certain areas on the borderline between the temperate and the sub-tropical zone will now become easier for human beings to live in because they will now be turning temperate instead of sub-tropical and will thereby be making good their previous deficiency in moisture and vegetation; and concurrently certain areas on the borderline between the sub-tropical and the tropical zone will also now become easier for human beings to live in because they will now be turning sub-tropical instead of tropical and will thereby be getting rid of their previous excess of moisture and vegetation. Conversely, when the whole series of latitudinally parallel zones shifts northwards, the same two sets of areas in the Northern Hemisphere will both now simultaneously become harder for human beings to live in: on the margin between the tropical and the sub-tropical zone owing to the northward advance of the zone of excessive moisture and vegetation, and on the margin between the sub-tropical and the temperate zone owing to the simultaneous northward advance of the zone of insufficient moisture and vegetation.

Now, on the assumption that civilizations arise as responses to challenges, and that their birth-places are therefore regions in which life is relatively hard, and not regions in which life is relatively easy, we have found no difficulty in explaining the geneses of the Nomadic, Egyptian, and Sumeric civilizations as responses to the challenge of a particular northward shift on the margin of oscillation between the sub-tropical zone and the temperate zone. On the same showing, the rise of the Syriac Civilization on the same margin—for example, in the oasis of Palmyra¹—ought to be the result (in so far as it is due to the climatic factor at all) of a similar

¹ For Palmyra, see II. D (i), pp. 9-12, above.

northward shift presenting a similar challenge of increasing aridity and barrenness. *Mutatis mutandis*, on the margin of oscillation between the sub-tropical zone and the tropical zone, the rise of the Mayan Civilization in Guatemala¹ ought also to be the result of a northward shift: a shift which, on this other margin, presents the antithetical but equally severe challenge of an increasingly excessive rainfall and an increasingly rank growth of vegetation.

It is here that Dr. Ellsworth Huntington appears to abandon, in detail, the view—which he shares with the writer of this Study in general and in principle—that civilizations arise as responses to challenges, whether these challenges be human or physical. For, in a passage already quoted in this Study,² Dr. Huntington suggests that the Mayan Civilization arose in Guatemala when the local climate was relatively dry and therefore relatively easy, and that its eventual decline was due to a local increase in moisture and vegetation which made the homeland of the Mayan Civilization a relatively difficult place to live in. Similarly, in another place,³ he suggests that the age in which Palmyra rose to eminence was an age in which the North Arabian Desert was relatively moist and fertile, and that the decline of Palmyra was the consequence of desiccation. In putting forward these two suggestions, Dr. Huntington appears to depart from his own general view that civilizations flourish on challenges and decay in their absence, and to range himself, for the moment, with the vulgar view that civilizations flourish on ease and wilt under difficulties.

With regard to Palmyra, the climatological evidence is scanty; and we shall simply observe that Dr. Huntington, in assuming a deterioration of the local climate in the age of Palmyra's decline, has to resort to the argument by exhaustion and that in arguing, on this line, that we must assume a climatic cause for lack of a social cause, he gravely underestimates the strength of the social factors by which the decline of Palmyra can actually be accounted for.⁴

With regard to Central America, Dr. Huntington has at his disposal the far more precise and detailed evidence that is afforded by a study of the growth-rings on cross-sections of the trunks of specimens of the Californian giant pine (*Sequoia*).⁵ On the basis of this evidence, he has compiled a remarkable table of dates⁶ purporting to show a chronological correspondence between 'inferred

¹ For the Mayan Civilization, see I. C (i) (b), vol. i, pp. 125-7; II. C (ii) (a) 2, vol. i, pp. 260-1; II. C (ii) (b) 2, vol. i, p. 321; II. D (i), pp. 3-4; II. D (vii), pp. 304-6.

⁶ Huntington, op. cit., Table 12 on p. 231.

climatic conditions in Mayaland' and 'historical conditions in Mayaland'. And, on the strength of the correspondence which he believes that he has established, he proceeds to argue¹ that, in the ages in which the Mayas created and maintained their civilization in the lowlands of Guatemala, this homeland of the Mayan Civilization was not covered by a rain-sodden tropical forest, as it is to-day, but then enjoyed the drier climate and less overwhelmingly luxuriant vegetation that are to be found to-day on the Pacific Highlands of Central America on the one hand and in the Mexican Province of Yucatan in the tip of the Yucatan Peninsula on the other hand—these being the regions which are comparatively populous and prosperous at the present time, when the rain-sodden forest that covers the former homeland of the Mayan Civilization is almost uninhabited.

In other words, Dr. Huntington suggests that, while the climatic zones have shifted to and fro in the course of the last two or three thousand years, the relation between Man and his Physical Environment has remained constant. As none of the present inhabitants of Central America are masters of the tropical forest, so, he suggests, it must always have been with their predecessors. The fathers of the Mayan Civilization must have made themselves at home in Guatemala in an age when the boundary between the climatic zones ran relatively far south and when accordingly, in Guatemala, the tropical forest was not in possession. Their descendants must have been evicted from Guatemala by the irresistible might of Physical Nature when the climatic zones shifted northward again and in consequence the tropical forest returned upon Guatemala to reclaim the country for its own. Indeed, Dr. Huntington goes so far as to maintain that the true tropical forest (as distinct from the jungle through which it tails off into the sub-tropical bush) has never yet been mastered by any human society at any time or in any place.²

In putting forward this view, Dr. Huntington believes that he is elucidating both the rise and the fall of the Mayan Civilization; but, to leave its fall out of the question for the moment, its rise, on this showing, surely becomes more difficult, and not more easy, to account for. Dr. Huntington asks us to believe that the Mayas have never faced the challenge of the tropical forest at all, but have lived, throughout the successive histories of the Mayan and Yucatec civilizations, in no other physical environment but that of the sub-tropical bush in which their descendants in north-western Yucatan

¹ In op. cit., ch. xvii: 'Guatemala and the Highest Native American Civilization', and ch. xviii: 'Climatic Changes and Maya History'.

² See op. cit., pp. 180, 186, and 187.

are living to-day. If that supposition is accepted as the truth, we are left without an answer to the question of what the challenge was that did evoke the Mayan Civilization. It was not, on Dr. Huntington's hypothesis, the challenge of the tropical forest; and at the same time we can cite the testimony of Dr. Huntington himself to show that no equivalent challenge, and indeed no challenge of any sort, is presented by the sub-tropical bush in which, according to Dr. Huntington, the Maya have lived and moved and had their physical being at all times in the history of the race and in all parts of Central America in which the race has ever at any time established itself. In describing the life and *ethos* of the present-day Maya in the bush of north-western Yucatan, Dr. Huntington draws a picture that bears an amazing resemblance to a description of primitive life in Tropical Africa which we have quoted already in another connexion.¹

'The pure Indian is a quiet, slow being, inoffensive and retiring unless abused. He seems never to work unless compelled. As for storing up anything for the future, the thought seems scarcely to enter his head. If he has enough to eat, he simply sits still and enjoys life until hunger again arouses him to activity. His wants are few and easily supplied. His agriculture begins by cutting the small growths of the bush, or jungle, girdling the larger trees, leaving the bush to dry during the season of little rain, and finally burning it off. Then he goes around with a pointed stick, making holes into which he drops corn, pumpkin seed, beans, and the seeds of one or two other vegetables. The corn is his chief reliance. When the corn is ripe, he has no thought of gathering it all at once and storing it away safely, perhaps in the form of flour or at least shelled. His method is to go out to the field in the early part of the dry season after the corn is well ripe, and half break each stalk in the middle so that it is bent over and the ears point downward. Little by little, he picks what ears he needs for daily use, caring nothing that insects, birds, and beasts are also eating what they need. He knows that a quarter or a third of the ears may be spoiled; but, so long as there are some for him, he cares little. The only thing that ultimately stirs him up to gather the remainder of the crop is the end of the dry season. Before the rains come he knows that he must harvest his crop and plant more seed or else he will starve. Therefore he arouses himself for the one period of effort during the year. He is hardly to be blamed for his apparent laziness. He certainly is lazy according to our standards; but he has little to stimulate him, and it is easy to get a living without much work.'²

One has only to compare this passage with the description, referred to above, of primitive life in Nyasaland in order to realize

¹ Drummond, H.: *Tropical Africa* (London 1888, Hodder and Stoughton), pp. 58-9, quoted in II. D (i) on pp. 26-7, above.

² Huntington, Ellsworth: *The Climatic Factor as illustrated in Arid America* (Washington 1914, Carnegie Institution of Washington, Publication No. 192), p. 180.

that, in the un-exacting, and therefore un-stimulating, environment of the sub-tropical bush, the descendants of the people who created and maintained the Mayan and Yucatec civilizations have relapsed right back to the primitive level. And, in the light of this fact, it is surely more difficult to imagine how, once upon a time, this self-same environment can have stimulated earlier representatives of the self-same race to build Copan and Uxmal or to think out the Mayan calendar than it is to suppose that these immense achievements were evoked by the tremendous challenge that is presented—not by the sub-tropical bush, but by the tropical forest.

So much for the attempt to ascribe the birth of the Mayan Civilization in Northern Guatemala or the blossoming of the Syriac Civilization at Palmyra to a state of physical ease arising from a shift in the absolute position of the tropical and sub-tropical and temperate climatic zones. At the same time, there is no objection to supposing that, not only in these two cases but also in several others which have been cited in this Study,¹ a physical alleviation, produced in this way, may have played a secondary 'permissive' or 'enabling' part in the genesis of a civilization, not by introducing a condition of physical ease, but by tempering a physical challenge of previously prohibitive severity to a lesser degree at which the severity has ceased to be prohibitive and has become, instead, a potent stimulus. And, conversely, we may legitimately suppose that, in a case where a civilization is already in decline through other causes, an accentuation in the severity of the climatic challenge may have the effect of making the decline irretrievable and hurrying it towards a final fall.

We may also suppose that, in a case where a civilization is in an exact, and therefore static, equilibrium with its environment,² a change in the physical environment, arising from a shift of the climatic zones, may act upon the society in question in a mechanical way instead of through the vital give-and-take of Challenge-and-Response. This is to be expected, because a society that is 'arrested' in static equilibrium is inhibited, *ex hypothesi*, from exercising the vital mobility and free will and initiative which the movement of 'Challenge-and-Response' involves. In this condition, a society must either remain unaffected by the impact of an external force or else react to this impact in a merely mechanical fashion. A case in point is the reaction of the 'arrested' Nomadic Civilization of the Afrasian and Eurasian steppes to climatic changes arising from the periodic shifting of the climatic zones in this area. In periods of increasing humidity, the Nomads are apt to yield ground to the

¹ See II. D (vii), pp. 306-9, above.

For such 'arrested' civilizations see Part III. A, below.

encroachments of their agricultural neighbours in the borderland between the Desert and the Sown. Conversely, in periods of increasing aridity, the Nomads are apt to burst the bounds of the Steppe and to pour out, in eruptions of volcanic violence, over the domains of their sedentary neighbours. The connexion between these eruptions of the Nomads and the pulsatory variations in the climate of the Steppes is examined further in Part III. A, Appendix II, in Volume III, below.

ANNEX II TO II. D (vii)

THE THREE-CORNERED RELATION BETWEEN THE ROMAN CHURCH, ENGLAND, AND IRELAND

SINCE the first encounter between the English and Irish peoples and the Roman Church, the relations between the three parties have passed through almost every possible permutation and combination. From the seventh century to the twelfth, the English were apt to be the faithful servants of the Roman See, while the Irish were disinclined from the Roman practice and recalcitrant towards the Roman authority. Since the sixteenth century, on the other hand, the Irish have been devoted adherents of Rome, while the English have been Protestants. It is noteworthy, however, that, although the changes which the three-cornered relation has undergone in the course of nearly thirteen centuries have been kaleidoscopic, the English have always contrived, in each successive situation, to retain the superior position which they secured in the seventh century and to keep the Irish at a disadvantage.

It might have been supposed, for example, that the English would have forfeited their advantage in the twelfth century when, nearly five hundred years after the Synod of Whitby, the Irish at length followed the English into the Papal fold. The incorporation of the Irish Christendom into the Roman Church was formally completed in A.D. 1152, when Cardinal Paparo, the first Papal Legate in Ireland, convened the Synod of Kells and reorganized the Irish dioceses. Yet it was only three years after this that a successor of the Pope who had dispatched the legate addressed to a King of England the Bull *Laudabiliter*,¹ which gave approval to the project of an English conquest of Ireland on the ground that this would have the effect of enlarging the bounds of the Church (just as though the Irish had not already come within the Roman fold of their own accord). Thereafter, the English conquerors arrogated to themselves—again, apparently, with Papal approval—a virtual monopoly of all high ecclesiastical offices in Ireland, from which the Irish came to be excluded generically. Thus their tardy reconciliation with Rome in the twelfth century profited the Irish nothing.

Again, it might have been supposed that the Irish would at least have profited by their loyalty to Rome in and after the sixteenth century, when the English turned Protestant; for now, at least, the Roman Church was bound to treat Ireland as her child when her former spoilt child, England, had shown herself so unfilial. Would

¹ See p. 337, footnote 1, above.

not Ireland be strengthened now, as England had been strengthened during the past nine centuries, by having the weight of the Continental Roman Church behind her in her everlasting struggle with her insular enemy? Unfortunately for Ireland, England has always had sufficient command of the sea since the sixteenth century to isolate Ireland from the Catholic countries of the Continent and to deal with her *tête-à-tête*.

But was not this situation, in which Ireland was isolated from the Continent by an English barrier, precisely the situation in which the abortive Far Western Christian Civilization had flourished so remarkably in the fifth and sixth centuries?¹ Unfortunately, again, for Ireland, the situation since the sixteenth century has differed from the situation in the fifth and sixth centuries in two important respects. In the first place, the English in the modern age, instead of being isolated and backward pagans, have been converts to Protestantism: a revised version of Western Christianity which has been adopted, not by the English alone, but by half the nations of the Western World, including some of the most energetic and progressive and successful members of the Western Society. The second difference in the situation is that, in the fifth and sixth centuries, the English had not yet attempted to invade and conquer Ireland and would not have been strong enough to succeed in the attempt even if they had made it. By the sixteenth century, on the other hand, the English conquest of Ireland was already half completed; and the new religious gulf which opened between the English and the Irish peoples, when the former turned against Rome and the latter remained loyal to her, inclined the English more than ever to treat the Irish as 'Natives' who were 'beyond the Pale' (an expression which is actually derived from conditions which prevailed in Ireland during the first phase of the English conquest). In the seventeenth century, the English 'planted' Catholic Ireland with Protestant settlers as ruthlessly as they were 'planting' pagan North America.² In consequence, after the Reformation, as before it, the Irish had to suffer from an English ecclesiastical tyranny which remained identical in substance in spite of its change in form. From the twelfth century to the sixteenth, when there was nominally one single church in Ireland to which Irish and English alike belonged, the English (as has been mentioned) assumed in this Church a monopoly of high ecclesiastical offices. Since the sixteenth century there have been two Churches in Ire-

¹ In those centuries, no doubt, Ireland had still maintained some communication, round the corner, with the coasts of Gaul and Spain. The ship on board which St. Patrick, in his youth, made good his escape from his slavery in Ireland was bound for a Gallic port.

² On this point see II. C (ii) (a) 1, Annex, vol. i, pp. 465-7, above.

land, and the Catholic Church has been in the hands of the Irish themselves. But from the moment when the Catholic Church in Ireland was thus thrown back into Irish hands as an incidental consequence of the English secession from Rome, this local native Irish Roman Church became a penalized institution with an alien Protestant Church in a dominant position over it. Thus the effect of the English Reformation upon the ecclesiastical position of the Irish was simply to confirm and accentuate the inferiority of their ecclesiastical status—an injustice which was only remedied by the combined effect of two nineteenth-century acts of the Parliament of the United Kingdom at Westminster: the Catholic Emancipation Act of 1829 and the Episcopalian Church of Ireland Disestablishment and Disendowment Act of 1869.

It will be seen that the history of the three-cornered relation between Ireland, England, and the Roman See from A.D. 664 to A.D. 1869 aptly illustrates the aphorism that *plus ça change, plus c'est la même chose*.

ANNEX III TO II. D (vii)

THE EXTINCTION OF THE FAR WESTERN CHRISTIAN CULTURE IN IRELAND

THE discomfiture of the Far Western Church by the Roman Church at the Synod of Whitby in A.D. 664 was the beginning of the end of the distinctive Far Western Christian culture in 'the Celtic Fringe' as a whole and in Ireland in particular, but the process of extinction was long-drawn-out.

In Ireland, this process was completed at different dates in different spheres of social life. In the ecclesiastical sphere, it was completed in the twelfth century, with the thoroughgoing incorporation of the Irish Christendom into the Roman Church.¹ In the political and literary spheres, it was completed in the seventeenth century, when Ireland was systematically 'planted' and subjected by the successive efforts of James I/VI and Cromwell and William III, and when the traditional art of the vernacular Irish literature fell into decay. This tradition, which went back without a break to the pre-Christian age, and which had been quickened into new life by the conversion of Ireland to Christianity and the development of a peculiar Far Western Christian Civilization, was not broken by the subjection of the Irish Christendom to Rome and of Ireland herself to England in the twelfth century; but the tribulations of the seventeenth century were fatal to it. Finally, in the linguistic sphere, the Irish Celtic vernacular language itself died out (except in a few remote and secluded districts in the west) in the course of the nineteenth century, partly owing to the spread of elementary education imparted in the English language, and partly through the retro-action upon Ireland of the Irish community in America, who became English-speaking instead of Irish-speaking as a result of crossing the Atlantic and settling in a New World where English was the *lingua franca*.

The fact that, by the twentieth century, English had become the real national language of Ireland was brought out in an amusing incident that occurred during the negotiations which preceded the conclusion of the Anglo-Irish Agreement of 1921. During these negotiations, the Irish representatives had been making a point, in the presence of the British representatives, of talking Irish with one another and signing their names in Irish characters; and it had become evident that they did not speak and write this Irish without a certain difficulty. Thereafter, there came a moment when the

¹ See II. D (vii), Annex II, above.

principal British negotiator, who was none other than the then Prime Minister of the United Kingdom, Mr. David Lloyd George, had occasion to hold a confidential conversation with his private secretary, Mr. Thomas Jones. Instead of taking the trouble to withdraw from the room where the negotiations were taking place, the two British representatives simply ceased talking English and began to talk to one another in Welsh, which was the native language of both of them. It then became evident to the Irish representatives in the room that, whereas their own real native language was English, there were at least two British representatives negotiating with them whose real native language was Welsh: a Celtic language to which these champions of England resorted for the sake of privacy because they could be certain that it would not be understood by any representative of Celtic Ireland!

The last stage in the long-drawn-out process of the obliteration of a distinctive Far Western Christian culture in Ireland has been the establishment of the Irish Free State, in which the negotiations of 1921 have happily resulted. Among the Irish themselves, this happy event has been widely regarded as a great act of restoration—a liberation of the Irish genius from the shackles placed upon it by the successive acts of foreign aggression which have followed one another since the seventh century. This is surely an amiable illusion; for, when the nature of modern Irish nationalism is analysed, it proves, like Zionism, to be really a radical form of 'Assimilationism'.¹ Nationalism (whatever nation's nationalism it may happen to be) is the characteristic and fundamental political creed of our modern Western Society; and 'to go nationalist' is the most infallible of all the symptoms of 'Westernization'. The captivation of the Irish by Nationalism, like the captivation of the Jews by Zionism, signifies the final renunciation of a great but tragic past in the hope of securing in exchange a more modest but perhaps less uncomfortable future. If Jewish Zionism and Irish Nationalism succeed in achieving their aims, then Jewry and Irishry will each fit into its own tiny niche in the colossal structure of the modern Western World as one among sixty or seventy national communities all organized on the standard Western pattern. In this posture, the Irish and the Jews may find life in a Western environment somewhat easier than they have found it under the previous conditions when each of them still represented, not just a commonplace national articulation of an overgrown Western body social, but the relic of an independent society of the same species and order as the whole of Western Christendom.

Thus the establishment of the Irish Free State is a prosaic rather

¹ See the critique of Zionism in II. D (vi), on pp. 252-4, above.

than a romantic event. In fact, it signifies that the romance of Ancient Ireland has at last come to an end, and that Modern Ireland has made up her mind, in our generation, to find her level as a willing inmate in our workaday Western World. The romantic trappings of the Free State, which catch (and are no doubt intended to catch) the English eye, are superficial and perfunctory. While the new Irish Parliament and political parties, and the Free State itself, have been decked out with arresting Irish styles and titles, Irish civil servants and school-teachers are rebelling against the demand that the qualifications required of them shall be made to include an effective knowledge of the Irish language (a non-utilitarian accomplishment, inasmuch as Irish is no longer a living language except among the peasantry of a few districts in the west of the island). It is also significant that there has been no movement in Ireland for changing the seat of government: a costly and inconvenient proceeding which is almost common form at the foundation of 'successor-states'. Tara, the deserted capital of the Ancient Irish High Kings, has been left at the disposal of the archaeologists, while the Government of the Irish Free State has installed itself in Dublin: a city originally founded by Scandinavian interlopers and afterwards taken over from them by the English conquerors to become the head-quarters of the foreign garrison by which Ireland has been dominated for more than seven centuries. Yet, in spite of this historic association with an alien ascendancy, Dublin has been accepted as the inevitable capital of a new Irish national state for the substantial reason that Dublin is the geographical point of contact between little Ireland and the great circumambient modern Western World in which Ireland has now resolved to merge herself.

ANNEX IV TO II. D (vii)

THE FORFEITED BIRTHRIGHT OF THE ABORTIVE FAR WESTERN CHRISTIAN CIVILIZATION

Now that the issue between Iona and Rome has been settled conclusively and irrevocably, it needs a vigorous effort of the historical imagination to conceive that, in the seventh century of the Christian Era, the embryonic Celtic and the embryonic Roman Church contended with one another for the prize of becoming the chrysalis of the new society which was to emerge in the West. The actual emergence of our modern Western Civilization from a Roman ecclesiastical chrysalis is such a prominent and important fact in our Western history as it has happened to take shape, that it is difficult to persuade oneself that this historic outcome was not inevitable but was merely one of two possible alternatives. Yet this now barely credible proposition is the manifest truth. During the post-Hellenic interregnum there was a real possibility of an Irish victory and a Roman defeat; and this alternative outcome—which would have given the whole of our Western history quite a different turn from that which it has actually taken—might have been realized in the seventh century, or even in the eighth, if, in certain stubbornly contested battles between certain well-matched forces, the victory had remained with the side which actually accepted defeat.

It may be suggested, without extravagance, that our modern Western Civilization would probably have been derived from an Irish instead of a Roman embryo *either* if Colman instead of Wilfrid had won the Synod of Whitby in A.D. 664 *or* again if 'Abd-ar-Rahmān instead of Charles Martel had won the Battle of Tours in A.D. 732. And we may confidently promote this probability into a certainty if we allow ourselves the historical licence of imagining that in *both* these 'decisive battles of the World' the Fortune of War had fallen out otherwise than it did.

The course which European history seemed likely to take, at the moment when 'Abd-ar-Rahmān, carrying all before him, was bearing down upon Charles Martel, has been imagined by Gibbon in a famous *tour de force* of historical speculation:

'A victorious line of march had been prolonged above a thousand miles from the Rock of Gibraltar to the banks of the Loire; the repetition of an equal space would have carried the Saracens to the confines of Poland and the Highlands of Scotland: the Rhine is not more impassable than the Nile or Euphrates, and the Arabian fleet might have sailed without a naval combat into the mouth of the Thames. Perhaps the

interpretation of the Koran would now be taught in the schools of Oxford, and her pulpits might demonstrate to a circumcised people the sanctity and truth of the revelation of Mahomet.¹

We should rather be inclined to speculate that 'Abd-ar-Rahmān's victory—had he overthrown Charles Martel in A.D. 732—would have proved of less advantage to the Arabs and Islam than to the Celts and Far Western Christendom.

An Arab victory at Tours might conceivably have had the effect of adding the Gallic territories south of the Loire and west of the Alps to the permanent dominions of the Arab Caliphate. The *ci-devant* Roman citizens of Aquitaine and Provence had already been linked once before with their fellow-Latins in the Iberian Peninsula under the rule of the Visigoths: the Teutonic barbarians who had set up the first 'successor-state' of the Roman Empire in this quarter. The Visigoths had been driven back from the Loire to the Pyrenees by their Frankish kinsmen and rivals in A.D. 507-8;² yet, until the Arabs superseded them in the possession of their remaining dominions, the Goths had always retained a foothold on the Gallic side of the Pyrenees in Septimania; and, though more than two centuries had passed between Clovis' march to the Pyrenees and 'Abd-ar-Rahmān's march to the Loire, the Aquitanians had never become reconciled to the rule of the Franks, whose little finger was thicker than the Visigoths' loins.³ No doubt the Latins of Aquitaine would have been at least as well content as the Latins of the Iberian Peninsula were to exchange a Teutonic for an Arab master. And we can therefore readily imagine an Arab victory at Tours being followed by a permanent annexation of Aquitaine and Provence, as well as Spain and Septimania, to the Arab Caliphate.

On the other hand, it is not so easy to follow Gibbon's flight of imagination in fancying that the troops of 'Abd-ar-Rahmān might have doubled their thousand-mile march from Gibraltar to the Loire by marching on from the line of the Loire to the line of the Caledonian Canal or the line of the Oder. For even if 'Abd-ar-Rahmān had scattered the Franks to the winds and had found himself, on the morrow of a decisive victory at Tours, left master of the situation, with no organized military power any longer in existence anywhere in Northern Europe to contest his advance, it seems probable that the further advance which Gibbon imagines, and which no human obstacle would then have hindered, would have been prohibited—as inexorably as Alexander's ruefully abandoned

¹ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, ch. lli. The passage has been cited in this Study already, by anticipation, in I. B (iii), vol. i, on p. 30, footnote 1, above.

² For Clovis' victory at Vouillé in A.D. 507 see II. D (v), p. 166, *abōve*.

³ 2 Chronicles x. 10.

advance beyond the Ganges—by the physical impossibility of lengthening any further an already stupendously long line of communications. From their capital at Damascus and their reservoir of soldiers in the Arabian hinterland, the Umayyad Caliphs were unable to send reinforcements and supplies by sea from the Mediterranean ports of Syria and Egypt to those of Spain and Gaul, because the naval command of the Mediterranean had been retained by the East Roman Empire.¹ They thus had no short and easy alternative to the land-route across the whole breadth of North Africa from the Isthmus of Suez to the Straits of Gibraltar; and this route was not only long and round-about but was also beset with obstacles, both physical and human: the difficulty of crossing the desert and the danger of being set upon by the Berbers. Accordingly it seems wise, on this point, to differ (with great deference) from Gibbon; and to imagine that an Arab victory at Tours in A.D. 732 would have carried the North-West frontier of the Arab Caliphate up to the Loire and the Alps but (in all probability) not beyond them.

What would have been the probable effect of an expansion of the Caliphate, up to but not beyond these limits, upon the history of Europe?

The first effect would have been once again to isolate the Far Western Christendom of the British Isles from the Roman Church—as it had been isolated once before, three centuries earlier—by the interposition of an alien society. In this respect, the Muslim Arabs in Southern Gaul would have performed the same function as the pagan English in Eastern Britain; only, this time, the barrier would have been drawn along a line which would have given a much greater geographical advantage to the Far Western embryo of a nascent Western Civilization than to its Roman competitor. In the first place, the Far Western Church would assuredly have retrieved the defeat which it had suffered at Whitby half a century earlier, and would have drawn the English, as well as the Irish and the Welsh and the Bretons, into its fold. In the second place, the Far Western Church would then almost certainly have captured from the Roman Church the whole existing and surviving extent of Continental North European Christendom. The country between the Loire and the Rhine was already honeycombed with Irish monastic cells;² and in A.D. 732 the Irish missionaries in the Continental pagan marches of the day—Frisia and Hesse and Thuringia and Bavaria—had not yet been suppressed by the English Romanizing

¹ See J. B. Bury's *editio minor* of Edward Gibbon's *The History of the Decline and Fall of the Roman Empire*, vol. vi, Appendix 5: 'The Byzantine Navy.'

² See the map illustrating 'Les Expansions Irlandaises' in Gougau, *Les Chrétientés Celtiques* (Paris 1911, Gabalda), ad fin.

interloper Boniface. We may even conjecture that Boniface himself would have found it impossible thereafter to carry on his own missionary work in Central Europe without transferring his ecclesiastical allegiance from Rome to Iona. In our mind's eye we begin to perceive the outlines of a picture—never committed to canvas by the Artist of human destiny—in which a Far Western Church, with its centre and source of energy in Ireland and its southern frontier along the Loire, consolidates its dominion over the British Isles and the adjacent portions of the European Continent and then gradually extends its domain north-eastwards—by converting the Saxons and the Scandinavians—until its advance in this direction is eventually barred by a collision with the Orthodox Christian Church, as the actual advance of the Roman Church in the same direction was eventually barred by the same barrier in the fourteenth century.

In studying this actual historical process we have had occasion to notice that when Roman and Orthodox Christendom did collide in Northern Europe, after the elimination of the last of the pagan North European barbarians, the eventual line along which the two Christian civilizations established their contact ran south and north from the shores of the Adriatic to the shores of the Arctic Ocean.¹ Where are we to draw our imaginary boundary between the Orthodox and the Celtic Christendom in our hypothetical reconstruction of our Western history? We may assume, to begin with, that if 'Abd-ar-Rahmān had won the Battle of Tours in A.D. 732 and had carried the permanent frontier of the Caliphate to the foot of the Alps as well as to the banks of the Loire, the whole of Italy, including Rome itself, would then have clung to the skirts of Orthodox Christendom as the only valid protection against this Arab menace.

The moment when the Arabs and the Franks were fighting their decisive battle at Tours was also a turning-point in the relations of the Roman See with Orthodox Christendom and of Italy with the East Roman Empire. At this moment, the iconoclastic policy of the Imperial Government at Constantinople—a policy which the Emperor Leo the Syrian had promulgated in A.D. 726²—was driving a wedge between these two portions of a hitherto undivided Catholic Christendom.³ The Pope was refusing to accept the proscription of image-worship by Imperial decree; the enclaves of Imperial territory in Central Italy which had hitherto held out against the

¹ See II. D (v), pp. 168-9, above.

² This policy of Iconoclasm was launched by Leo as soon as he had succeeded in restoring the East Roman Empire (a ghost of the Roman Empire) in the homelands of Orthodox Christendom. (For Leo's role in Orthodox Christian history see I. C (i) (b), vol. i, p. 64, footnote 3, above, and Part X, below. For Leo's personal history see III. C (ii) (b), vol. iii, pp. 274-6, below.)

³ For the progressive alienation of the Roman from the Orthodox branch of Catholic Christendom see I. C (i) (b), vol. i, pp. 66-7, above.

Lombard barbarian intruders were renouncing their allegiance to the Empire; and the Lombards themselves were preparing to round off their uncompleted conquest of the peninsula by attacking and conquering piecemeal these long-recalcitrant enclaves which had now at last rendered themselves defenceless by deliberately repudiating the East Roman Government's support. At the news of an Arab victory over the Franks at Tours we may conjecture that all these incipient movements in Italy would have been arrested forthwith and reversed.

The Pope and the Romagnols would have hastened to make their peace with the Emperor at Constantinople in order to make sure of Imperial protection against an agile Arab aggressor who had shown himself far more formidable than the heavy-footed Lombard. The Franks—defeated at Tours and now cut off from Italy by the new dominion of the Arab Caliphate in Southern Gaul—would never have suggested themselves to the minds of Papal statesmen as possible alternative protectors of the Roman See, in lieu of the East Roman Emperors. The Lombards would have ceased to cast covetous eyes upon the surviving East Roman possessions in Italy, and would rather have offered their own allegiance to the East Roman Empire in order to save themselves from suffering, at Arab hands, the fate which had already overtaken their own Teutonic kinsmen the Visigoths and the Franks. Thus Justinian's 'great idea' of reuniting the Italian with the Balkan and the Anatolian Peninsula in a reconstituted Roman Empire—a feat which had actually been accomplished in the sixth century, only to be undone forthwith by the Lombard invasion—would have been realized definitively in the eighth century of the Christian Era, thanks to the masterful intervention of the Arabs in Gaul.

In that event we may conjecture that, a century later, the Orthodox Christian missionaries Cyril and Methodius would have been successful in winning the field of their labours—Moravia and Bohemia—for an Orthodox Christendom which would have embraced both the Patriarchate of Constantinople and the Patriarchate of Rome.¹ In these circumstances it is probable that, in the partition of barbarian Europe between the Orthodox and the Celtic Christendom, the Orthodox Church would have gathered into its fold the whole vast family of the Slavs, and that the ecclesiastical boundary between the two Christian societies would have run through Central Europe, south and north, from the Alps to the Baltic, along the line of the contemporary linguistic boundary

¹ The geographical conditions resulting from the historical schism between the Patriarchates of Constantinople and Rome in the eighth century actually rendered Cyril and Methodius's work for Orthodox Christendom in Central Europe abortive. (See I. C. (i) (b), vol. i, p. 65, above.)

between the Slavonic and the Teutonic vernaculars. The new Western Society derived from an Irish embryo would then have been confined on the European Continent to a modest enclave between the Loire and the Alps and the Böhmer Wald and the Elbe, and its centre of gravity would have rested overseas: in the British Isles or perhaps eventually in Scandinavia. As for the rival Roman embryo, its attempt to arrogate to itself the function of becoming the chrysalis of a new Western Civilization would have been written off by latter-day historians as an effort which was not uninteresting in spite of its having been abortive, just as the Irish attempt is written off now.

On this showing we may perhaps partly attenuate and partly embroider Gibbon's fantasy. We have already represented the Celtic pioneer Columbanus to ourselves as a second Bellovesus.¹ Let us think of the Syriac conqueror 'Abd-ar-Rahmān as a second Hannibal;² and let us imagine him—after a decisive victory over the Franks at Tours—taking up again the brilliant policy, which the Carthaginian statesman and strategist had conceived a thousand years before, of an anti-Roman coalition, on West European ground, between the Syriac Society and the Celts.³ Let us further suppose that the Arab—rendered more prudent than the Carthaginian by the greater distance at which, in Gaul, he finds himself from his base—is content to clip the wings of Rome by excluding her from Transalpine Europe, and that he does not follow the path of his Carthaginian predecessor in the hazardous enterprise of crossing the mountains and seeking out his enemy in Italy itself. In that event, the picture which we have already drawn will materialize. While Italy and the Slavias gravitate towards Orthodox Christendom, the Arab victor at Tours, who is too prudent to attempt the passage of the Alps, is equally firm in declining to march on, another thousand miles, into the heart of an unknown and barbarous continent until he arrives at the western confines of Slavdom or at the northern extremity of Britain. Instead of embarking on any such crack-brained military adventure, he insures the exclusion of Roman and East Roman influence from North-Western Europe by making friends, beyond the Loire, with the Bretons and the other Far Western Christians who follow the Celtic Rite, and who are just as ready as the Far Eastern Christian Nestorians and Monophysites to escape the yoke of a Catholic-Orthodox Christendom by placing themselves under the aegis of Islam.

On this reckoning we need not push our flight of fancy so far as to imagine the interpretation of the Qur'ān being taught in the

¹ See II. D (vii), pp. 330-1, above.

² This analogy had already been suggested in II. D (v), on p. 203, above.

³ For Hannibal's policy see II. D (v), pp. 161-2, above.

schools of modern Oxford. We may paint, instead, the rather less sensational picture of a Celtic Easter being celebrated in the University Church by monks exhibiting the Celtic tonsure and belonging to the Ionan Order of Saint Columba. And we may imagine Irish scholars, with their lively intellectual curiosity and their restless *Wanderlust*, resorting to the seats of Arabic learning—not merely to Cordova but to distant Baghdad and Samarkand—and bringing back a knowledge of Aristotle, not to Oxford or to Paris but to Clonmacnois: the metropolitan university of a Western World which looks for intellectual light to Ireland.¹ Assuredly these active and brilliant Irishmen would have acquired this precious knowledge from the Arabs at least three centuries earlier than the date at which it was actually conveyed from Toledo to Paris by the stolid descendants of Charles Martel's Franks who have deflected the course of our Western history for ever, but perhaps not for good, by refusing to accept defeat at Tours at the hands of 'Abd-ar-Rahmān's Arabs!

So near did the Celtic rear-guard of the North European Barbarism come to wresting from the Roman Church the privilege of creating a new Western Civilization. In this conflict, Rome only just succeeded in gaining the upper hand over Ireland.

¹ A certain affinity between the Irish and the Saracenic genius appears to reveal itself in the realm of art; for the Irish art of the now extinct Far Western Christendom is on a par with the Saracenic art in its love for, and mastery of, geometrical design, while its weakness lies in the delineation of living creatures, which, for Muslim artists, is *tabu*. (For these characteristics of Irish art, see Gougaud: *Christianity in Celtic Lands*, pp. 371 and 374.)

ANNEX V TO II. D (vii)

THE RESEMBLANCE BETWEEN THE ABORTIVE SCANDINAVIAN CIVILIZATION AND THE HELLENIC CIVILIZATION

THE resemblance of the abortive Scandinavian Civilization to the successful Hellenic Civilization is not of course confined to the fields of literary art and political organization;¹ it reveals itself likewise in the fields of religion and of *êthos*. The resemblance in *êthos*, which consists in the combination of a precocious originality with a precocious rationalism, is touched upon on pp. 355-7, above. The resemblance in religion is twofold. In the first place, the Pantheon of Asgard resembles the Pantheon of Olympus in being a society of divinities conceived in the likeness of human beings, and this not only in their physical form but in their heart and mind and experience and fortune. In the second place the mythology of which this pantheon is the subject is strangely divorced from worship. The Gods and Goddesses who are most prominent in the myths are not invariably the objects of the most popular or the most hallowed cults; and, conversely, some of the *numina* which are the objects of these outstanding cults play quite an obscure part, or no part at all, in the mythological drama. This divorce between myth and cult is brought out in the case of the Hellenic religion by Miss J. E. Harrison in her *Prolegomena to the Study of Greek Religion*,² and in the case of the Scandinavian religion by Professor H. M. Chadwick in *The Cult of Oðin*.³

These resemblances in religion and in *êthos* between the Scandinavian and the Hellenic Civilization cannot be explained, like the political and artistic resemblances, as outcomes of the identic experience of transmarine migration which was common to the Greek settlers in Ionia and to the Norse settlers in Iceland. On the other hand, they seem too close to be fortuitous. Can we then account for them otherwise?

A generation or so ago scholars would have confidently attributed all these resemblances alike to 'the common Indo-European origin' of the Teutonic-speaking and Greek-speaking layers of North European barbarians by whom the Scandinavian Civilization and the Hellenic Civilization were respectively created, but this explanation no longer satisfies us; for we have now realized that a genetic relationship between two languages is no evidence for the existence of any racial relationship between peoples speaking

¹ For the resemblance in these two fields, see II. D (iii), pp. 86-100, above.

² 2nd ed., Cambridge 1908, University Press.

³ London 1899, Clays.

those languages, and also that a racial relationship, even if effectively demonstrated by direct anthropometric measurements, is no evidence for any community of *êthos* or tradition between peoples that prove to be racially akin to one another. In fact the old hypotheses of 'an Indo-European race', 'an Indo-European *êthos*', and 'an Indo-European religion' have been exploded; and explanations of actual resemblances between different peoples of Indo-European speech have therefore to be sought elsewhere.

The resemblances in certain religious phenomena between the Scandinavian rear-guard of the Teutons and the post-Minoan Greeks do extend to at least one other people speaking an Indo-European language: namely, the Aryan-speaking Nomads from Eurasia who created the Indic Civilization on the site of the fore-going 'Indus Culture'. On the other hand there are other Indo-European-speaking peoples—for example, the Italic—who display no trace of these particular religious phenomena. The Italic do not appear to have conceived their divinities in human likeness; they had little or no mythology; and their cults were crude magic. Yet the Italic were 'Indo-European' in just the same sense (whatever the sense may be) as the Teutons and the Greeks and the Aryas. Thus these particular religious phenomena are palpably something less than the universal heritage of 'an Indo-European family' of peoples. Yet, even if the old concept of 'an Indo-European family' is abandoned, this does not exclude the possibility of a common origin for certain particular Indo-European tribes which are geographically far removed from one another at the time when they first emerge into the light of History. It may not be fantastic to conjecture that the Teutonic-speaking Goths and Gauts of Scandinavia may have been descended from a fragment of the same Indo-European-speaking tribe as the homonymous Getae and Thyssagetae and Massagetae of the Eurasian Steppe who are represented to-day by the Jâts of the Panjab.¹ A similar connexion may be postulated between the Aryan-speaking Bhrigus of India and their Thraco-Phrygian-speaking homonyms the Brigoi of the Balkan

¹ If the European Getae in the Lower Danube Basin were a fragment of the same Nomad horde as the Thyssagetae between the Volga and Emba and the Massagetae on the Lower Jaxartes, then it is natural to postulate the same relation between the Davi or Daci, who were the historical neighbours of the European Getae in Transylvania, and the Dahae, who were the historical neighbours of the Thyssagetae and Massagetae in Transcaspiæ. Since the Dacians, at any rate, were regarded as a Thracian people by the time when they emerged into the full light of history in consequence of their collision with Rome, it might seem at first sight as though the tribal names Getae and Davi were both common to the Iranian-speaking and the Thracian-speaking branches of the Indo-European linguistic family. It is, however, perhaps more likely that the European Getae and Davi, like their homonyms east of the Volga, were a pair of originally Iranian-speaking hordes who gradually became assimilated to the sedentary Thracian-speaking populations whom they had conquered. Since the founders of 'the Parthian Empire' appear to have been Dahae (see p. 371, footnote 2, above), it would follow that the Roman Emperor Trajan's Transeuphratean and Transdanubian adversaries were blood brothers.

Peninsula and the Bebryces and Phryges of Anatolia; and again between the Kaşyapas who were the historical neighbours of the Bhrigus and the Cassiopaei who were the historical neighbours of the Brigoi. The same postulate may be extended to another series of tribal homonyms: the Illyrian-speaking Veneti (Enetoi) of Venetia, the presumably Thracio-Phrygian-speaking Enetoi on the Black Sea coast of Anatolia, the Slavonic-speaking Venedi (Wends) in the Pripet Marshes, and the Celtic-speaking Veneti on the Atlantic coast of Gaul, whose tribal name has survived as Vannes. Is there any evidence of the same kind for a common origin of the Teutonic-speaking and Greek-speaking tribes who respectively created the Scandinavian and the Hellenic Pantheon? In a recent study of the Greek language¹ it is pointed out that 'there was a Germanic tribe called Ingaev-ones, a name that apart from the suffix corresponds exactly phonetically to the name Akhaiw-oi'. And when we ask which particular Teutonic peoples these Ingaevones were, we find that 'by native tradition—assuredly the most trustworthy class of evidence which we possess in such matters—the name Ingaevones is connected with the peoples of the Baltic and with them alone'.²

Then can we explain the common features of the Scandinavian and Hellenic religions as the common heritage of a single Indo-European-speaking tribe, the Ingaevones-Akhaiwoi, which had broken into fragments and come to be dispersed, in the course of history, from the Baltic to the Aegean? We may go on, if we choose, to fortify—or weaken—this equation between the Teutonic Ingaevones and the Greek Akhaiwoi by adding an equation of our own between the Teutonic Istaevones and the Greek Histiaioi; and at first sight this modified version of the 'common Indo-European origin' hypothesis looks attractive. Yet, before accepting it, we may pause to take account of two considerations: first, that it is notoriously hazardous to build historical hypotheses upon resemblances in nomenclature which may be accidental; and second that, in this particular case, the 'tribal identity' hypothesis which explains the resemblance between early Scandinavian religion and early Hellenic religion does not explain their common resemblance to early Indic religion as it is conveyed in the Vedas.

A more convincing explanation will be found in a common experience and achievement of the Norsemen and the Achaeans and the Aryas which has nothing whatever to do with the 'Indo-European' family-relationship between their respective languages. All three peoples alike were barbarians who happened—each in their

¹ Atkinson, B. F. C.: *The Greek Language* (London 1932, Faber & Faber), p. 14, footnote 1.

² Chadwick, H. M.: *The Origin of the English Nation* (reprint: Cambridge 1924, University Press), ch. ix: 'The Classification of the Germani', p. 219.

own time and place—to become ‘external proletariats’ of declining civilizations, and who each succeeded, or very nearly succeeded, thereafter, in becoming the creators of new civilizations on the sites of the antecedent civilizations whose domains they overran in their *Völkerwanderungen*. At previous points in this Study¹ we have already attributed the idiosyncrasy of the Hellenic religion to the barbarian origin of the Hellenic Society. We have derived the Olympian Pantheon from the barbarian war-band, and have explained the divorce between Hellenic mythology and Hellenic worship as a vestige of the unbridged cultural gulf between barbarian intruders who fashioned a new civilization out of their own social heritage and the heirs of an antecedent civilization who had failed to assimilate the intrusive barbarians. If this explanation of the Hellenic religion is right, then we can account in the same way for the features which the Hellenic religion shares with the Indic and the Scandinavian; since these are precisely the features that derive from the barbarian origin which the successful Hellenic and Indic and the abortive Scandinavian Civilization have in common.

ANNEX VI TO II. D (vii)

THE FORFEITED BIRTHRIGHT OF THE ABORTIVE SCANDINAVIAN CIVILIZATION

HAVING observed the narrowness of the margin by which the abortive Scandinavian Civilization failed to achieve its manifest destiny, let us now imagine to ourselves that the historic encounter between the Vikings and the Civilizations of the South had ended, not as it actually did, but in the other of the two possible alternative outcomes. Let us imagine, that is to say, that the Teutonic rear-guard, instead of being eventually discomfited like the Teutonic van-guard, had eventually triumphed over Roman and Orthodox Christendom, as the Achaean barbarians had once actually triumphed over the Minoan Civilization and the Hittite Civilization. Owing to the accident that, in the Scandinavian case, history has happened to take the other of the two equally possible alternative courses, the unfulfilled consequences of the unachieved victory of the Scandinavian barbarians are as difficult to apprehend in our latter-day imaginations as the unfulfilled consequences of the unachieved victory of the Far Western Christians of Ireland.¹ Yet, if we glance again at the critical events in the history of the Viking Age, we shall recognize that the Scandinavian Vikings, like the Irish missionaries, came within an ace of succeeding in their gigantic enterprise.

Let us suppose that they had just succeeded, instead of just failing, to capture Constantinople in A.D. 860² and Paris in A.D. 885-6 and London in A.D. 895;³ let us suppose that Rollo had not been converted by Charles the Simple in A.D. 911⁴ nor Svyatoslav defeated by John Zimisces in A.D. 972;⁵ let us suppose that, at the turn of the tenth and eleventh centuries of the Christian Era, the Scandinavian settlers in Greenland had just managed, instead of just failing, to gain a footing on the North American Continent;⁶ and let us suppose that the Scandinavian settlers in Russia, having actually made themselves masters of the Dniepr and the Volga waterways, had proceeded to make use of these key-positions not merely for occasional raids upon the Caspian provinces of the 'Abbasid Caliphate'⁷ but for the exploration and mastery of the whole network of waterways that gives access to the Far East across the face of Eurasia. None of these seven suppositions are at all far-fetched or fantastic; and if we allow ourselves to postulate all

¹ See Annex IV, above.

⁴ See pp. 347-8, above.

⁵ See p. 349, above.

⁶ See pp. 291-3, above.

⁷ For these occasional Viking raids in the Caspian, see Kendrick, *op. cit.*, pp. 158-63.

of them, or even a majority of them, in imagination, we shall obtain a reconstruction of the course of history which will perhaps surprise us.

We shall see the Vikings trampling the nascent civilizations of Roman and Orthodox Christendom out of existence as thoroughly as the Achaeans actually crushed the decadent Minoan and the rising Hittite Society: so thoroughly, in fact, that the two annihilated civilizations do not leave any spiritual children, affiliated to them through a universal church, behind, but vanish, bag and baggage, from the face of the Earth to leave the field free for a new Scandinavian structure on barbarian foundations.¹ We shall then see this new Scandinavian Civilization reigning supreme in Europe in Christendom's stead and marching with the Arabic Civilization across the Mediterranean, and with the Iranic Civilization across the Caspian, as the Hellenic Civilization, once created on new barbarian foundations by the Achaeans, actually marched with the Egyptian and Babylonian civilizations in the place of the Minoan and Hittite civilizations, when these had been so utterly overthrown that their place did not know them any more.² And, after this, we shall watch the Scandinavians turning their energies to the extension of their domain into the barbarian hinterlands on either flank.

The Scandinavians, in their day, were assuredly as efficient in the art of exploration and commerce and conquest and colonization along the channel of inland waterways as the latter-day Cossack pioneers of the Old World or the latter-day French and English pioneers of the New World. The Cossacks, who made themselves masters of the waterway of the Lower Dniepr some five or six hundred years later than the Vikings, conducted their north-eastward operations from this base with such effect that, within two or three centuries, they had threaded their way across the vast expanse of river-shot continent that stretches away from the left bank of the Dniepr to the coast of the Sea of Okhotsk.³ Is it credible that the Dniepr-Vikings and the Volga-Vikings would have failed to anticipate the achievement of the Cossacks if they had applied their thoughts and energies seriously to this task?⁴ Again, the French

¹ For this unfulfilled possibility, see I. C (i) (b), vol. i, p. 99, above.

² Job vii. 10.

³ For the achievement of the Cossacks, and the stimulus of alien pressure to which this achievement was a reaction, see II. D (v), pp. 154-7, above.

⁴ The Vikings were actually better placed than the Cossacks for penetrating and mastering the Great North-East, since they were already masters of the Volga—a waterway of unique importance over which the Cossacks never obtained control (the Cossacks were anticipated by the Muscovites on the Lower Volga and therefore had to make the leap from the Don to the Yaik). The Vikings reached the Volga partly direct from the Baltic (the portage to the Volga Basin from the Volkhov Basin is shorter, though less level, than the portage to the Dniepr Basin from the Volkhov Basin) and partly by a roundabout route down the Dniepr into the Black Sea and out of the Black Sea into the Sea of Azov and up the River Don and across the portage between the Don and the Volga at the point where the courses of the two rivers approach nearest to one another. (See Kendrick, *op. cit.*, pp. 158-63.)

and English mariners who eventually made themselves masters of the St. Lawrence and the Hudson, some six centuries after the Greenland Vikings had just failed to master these two North American waterways, pushed westward, inland, up-stream, and on into the Basin of the Mississippi with such effect that, within two centuries, the victorious Western pioneers had reached the coast of the Pacific. Is it credible that the Vinland-Vikings (if Vinland had actually become, as it so nearly became, a Scandinavian colony) would have failed to anticipate the achievement of the French *coureurs* and the English backwoodsmen? The estuary of the St. Lawrence, which offers itself invitingly to any seafarer approaching North America from the direction of Greenland, induces the explorer, through the chain of the Great Lakes, into the heart of the Continent; and here, at the head of the Lakes, lie vast tracts of country with a soil and a climate in which the Viking pioneer would have found a larger and more genial reproduction of his native Scandinavia.

The peculiar suitability of this region for Scandinavian agricultural settlement is demonstrated by the strength of the modern Scandinavian contribution to the population of the present States of Wisconsin and Iowa and Minnesota; but the Swedish and Norwegian farmers who have been attracted to the American North-West and have 'made good' in these new surroundings within the last half-century have not been pioneers themselves. They have waited for French and English pioneers to lead the way into an American land of promise which these modern Scandinavian settlers' Viking forefathers were on the verge of discovering for themselves at the turn of the tenth and eleventh centuries of the Christian Era. If a few more Viking ships had made the passage from Greenland to Vinland in that age, or if the ship's companies that did make the passage had not shown something less than the usual Viking determination and enterprise in failing to push on beyond the fringe of the great new world upon which they had stumbled, we must surely suppose that, by Hauk Erlendsson's time, some three centuries later, the Scandinavian World would have extended to the Pacific coast of North America¹ as well as to the Pacific coast of Northern Asia. Perhaps the fourteenth century of the Christian Era, which actually saw the completion of the partition of the *ci-devant* Scandinavian domain between Western and Orthodox Christendom, would have seen, instead, a Scandinavian encirclement of the globe, when

¹ There is one alleged piece of material evidence—a Runic inscription, bearing the date A.D. 1362, which came to light at Kensington, Minnesota, in 1898—which opens up the possibility that, in Hauk Erlendsson's age, one band of Norse explorers from Greenland may have penetrated thus deep, at any rate, into the interior of the North American Continent. (See Holand, H. R.: *The Kensington Stone* (privately printed: Wisconsin 1932, Ephraim).)

Viking pioneers who had made their way across the breadth of the North Atlantic Ocean and the breadth of the North American Continent to Alaska¹ joined hands at last, across the Behring Straits, with other Vikings who, in starting out from Scandinavia, had turned their faces in the opposite direction and had crossed the Baltic in order to make their way across the breadth of Eurasia to Kamchatka.²

What would have been Iceland's rank and role in Hauk Erlendsson's day in a world in which Western Christendom and Orthodox Christendom were both extinct, and in which a triumphant Scandinavian Civilization, that had overrun Europe and encircled the globe, now found itself marching with the Arabic Civilization across the Mediterranean and with the Iranic across the Caspian and with the Far Eastern along the Amur and perhaps even with the Mexic Civilization along the Rio Grande? In this unrealized and therefore unfamiliar but by no means impossible world, it is evident that Iceland would long since have ceased to be a Scandinavian Ultima Thule and would have become, instead, the centre-point of the Scandinavian World: the inevitable stepping-stone, in mid-ocean, between the European and the American half of the gigantically expanded domain of a living and growing Scandinavian Society. And what would then have been the state of Icelandic culture? Would this brilliant culture, which actually wilted away under the transforming touch of Christianity before it had attained its prime, have been able to fulfil its early promise by going on steadily from strength to strength if a successful Viking conquest of Europe had extirpated Roman Christianity on its native soil before ever the alien religion had acquired an opportunity of exerting its corrosive influence upon Icelandic life? And if the Icelandic culture really had continued to develop, what special colour would it have taken and what special lines would it have followed?

From its actual development, before its life was cut short, we can surmise with some confidence that its aesthetic sensibility and intellectual penetration would have been of a rare quality and that its religious temperature would have been sub-normal.³ The

¹ This Arctic route from Europe to North America, which the Scandinavian mariners just failed to open up in the eleventh century of the Christian Era, is perhaps destined to be opened in the twentieth century by Western airmen. 'On the British Arctic Air Expedition [of 1930-1] we spent a year in Greenland investigating the possibilities of an air route between Europe and America. The advantages of the Arctic route are many. There are no long sea-crossings; the weather in most parts of the Arctic is more stable than in Europe; and, lastly, owing to the shape of the World, the Arctic route is the shortest between England and Central North America.' Mr. H. G. Watkins in *The Times*, 30th June, 1932.

² See Annex VII, below, for a comparison of the lost opportunities of the Scandinavians with those of the Osmanlis.

³ For an imaginary reconstruction of the religious history of medieval and modern Europe on the supposition that Christendom had succumbed to Viking assaults instead of beating them back, see I. C (i) (b), vol. i, p. 99, above.

two tendencies are interdependent, for both spring equally from the specific *êthos* of the Scandinavian Civilization which we have attempted to appraise above.¹ This *êthos*, as we have observed, bears an unmistakable resemblance to the Hellenic; and if we wish to conjecture what the Scandinavian genius might have achieved by the fourteenth century of the Christian Era—supposing that it had enjoyed the Hellenic immunity from a sterilizing contamination—we cannot do better than to remind ourselves of what had actually been achieved by the more fortunate Hellenic genius in its most brilliant early focus at a corresponding date.

What is the corresponding century in Hellenic history to Hauk Erlendsson's in Scandinavian? Hauk Erlendsson actually lived, and was no doubt highly conscious of living, in the fourteenth century of the Christian Era; but if Scandinavian history had taken the alternative course that we have allowed ourselves to imagine, Christianity would have been virtually extinct and the Christian Era therefore presumably obsolete by Hauk's time. In that case Hauk might have been conscious rather of living in the tenth century since the moment when his Scandinavian forefathers had struck out that independent course of their own which had eventually led their descendants to unforeseen heights of achievement. He might have reckoned his chronology from the beginning of the post-Hellenic *Völkerwanderung* (*circa* A.D. 375), when the Teutonic van-guard went off to the wars and the Teutonic rear-guard made its momentous choice of staying four centuries longer at home. And if we take the corresponding starting-point for Hellenic history, and measure off the centuries from the beginning of the post-Minoan *Völkerwanderung*, when the Achaeans made a Vandal choice and won Scandinavian laurels, what is the tenth century of the Hellenic Era on this computation? Simple arithmetic informs us that the Hellenic century which corresponds to Hauk Erlendsson's century in Scandinavian chronology is the fifth century B.C. (*circa* 525–425 B.C.). And if we contemplate the historic cultural achievement, in that famous century, of Ionia, the Hellenic Iceland, we may begin to imagine what might have been achieved, at an equivalent date, by Iceland, the Scandinavian Ionia, if Fortune had permitted the Icelanders, as she graciously permitted the Ionians, to work out their own high destinies undisturbed. In that contingency the Icelandic culture in Hauk Erlendsson's day might have reached and even passed its zenith, and Iceland might then have been in the act of handing the torch of Scandinavian Civilization to Norway and to Vinland, as Ionia, in the fifth century B.C., did

¹ See pp. 355–7, as well as Annex V, above.

hand the torch of Hellenic Civilization to Athens and to Magna Graecia.

So near did the Scandinavians come, when they responded to the challenge of Roman Christendom, to achieving the same success as the Achaeans achieved when they responded to the challenge of the Minoan Civilization.

ANNEX VII TO II. D (vii)

THE LOST OPPORTUNITIES OF THE SCANDINAVIANS AND THE 'OSMANLIS

IN the narrowness of the margin by which the achievement of success was missed on a number of crucial occasions, and in the vastness of the difference in the course that would have been taken by History if some or all of these enterprises had succeeded, the history of the Vikings bears a curious resemblance to the history of the 'Osmanlis.

For example, the fate of Western Christendom was at stake in the Ottoman siege of Vienna in A.D. 1529, as it was at stake in the Norse sieges of Paris in A.D. 885-6 and of London in A.D. 895. Again, the 'Osmanlis, like the Vikings, just missed a number of opportunities for expansion which other peoples took.

The 'Osmanlis' acquisition of Algeria in A.D. 1512-19 came just too late, and fell just too far short, to enable them to cut off, at its base, the Oceanic enterprise of the Castilians and the Portuguese. If Ottoman sea-power had been able to make itself felt at the western end of the Mediterranean some thirty years earlier, it might have come to the rescue of the last Moorish enclave in the Iberian Peninsula and have compelled the Castilians to fight for the retention of Andalusia at the moment when Ferdinand and Isabella were actually rounding off their Peninsular dominions by the conquest of Granada. In that event, the Spanish sovereigns might have lacked the leisure and the means for patronizing Christopher Columbus; and Columbus himself might have found it impossible, in A.D. 1492, to set sail across the Atlantic from Palos. (The 'Osmanlis did take sufficient interest in the discovery of the New World to execute a careful copy of a very early map of the Americas which they found on board a Spanish prize that was captured by an Ottoman squadron in the Western Mediterranean.)¹ Again, if the 'Osmanlis had followed up their acquisition of Algeria by making themselves also masters of Morocco, they might have brought Henry the Navigator's work to naught by closing the Portuguese route round Africa to India and the Far East. The Portuguese circumnavigators of Africa who were scarcely hampered in their enterprise by the activities of the Moorish pirates of Salee might have found themselves paralysed if the Atlantic coast of Morocco

¹ See Kähle, P.: *Die verschollene Columbus-Karte von 1498 in einer türkischen Weltkarte von 1513* (Berlin and Leipzig 1933, de Gruyter).

had given harbour to Ottoman fleets with the whole power of the Ottoman Empire behind them.

Similarly, the Ottoman conquest of Egypt in A.D. 1517 and of 'Irāq in A.D. 1534 came just too late to forestall the arrival of the Portuguese mariners in the Indian Ocean; and although the acquisition of seaboard on the Red Sea and on the Persian Gulf, in addition to their seaboard on the Mediterranean, gave the 'Osmanlis the great strategic advantage of holding the interior lines, this geographical asset did not make up for lost time. When an Ottoman naval squadron attacked the Portuguese at Diu in A.D. 1538, and Ottoman matchlockmen fought Portuguese matchlockmen in Abyssinia in A.D. 1542-3, these Ottoman operations were unsuccessful and they were never followed up.

Again, after the Ottoman victory over the Türkmen prince Uzun Hasan at Baiburt in A.D. 1473, there was nothing at the moment to stop the expansion of the Ottoman Empire overland into the central and eastern sections of the domain of the Iranic Civilization; and the 'Osmanlis would assuredly have been called in to the rescue by the Transoxanians and the Khurāsānīs at the beginning of the sixteenth century of the Christian Era, when the Eurasian frontier of the Iranic World was attacked by a new Nomadic invader in the shape of the Uzbegs, if this avenue for Ottoman expansion had not been closed, at that very moment, by the meteoric rise of Ismā'il Shāh Safawī.¹

Finally, we may note that the Grand Vizir Mehmed Sököllü's project of cutting a canal from the Don to the Volga, and so securing for the Ottoman Empire the command of the great Eurasian network of waterways, miscarried when it was actually attempted, in A.D. 1568-70, because the Muscovites had just anticipated the 'Osmanlis in securing command of the Volga by taking Qāzān in A.D. 1552 and Āstrakhān in A.D. 1554. This Ottoman project might well have succeeded if it had been put in hand in or immediately after A.D. 1475: the year in which the necessary base of operations had actually been secured by the conquest of Caffa and Tana and by the establishment of Ottoman suzerainty over the Crimean Tatars. In A.D. 1475 Muscovy had not yet doubled her power by the annexation of Novgovod, nor the Cossacks strengthened their hold on the Steppes by advancing from the line of the Dniepr to the lines of the Don and the Yaik.

These Ottoman lost opportunities are a remarkable analogue of the Scandinavian lost opportunities which we have reviewed in Annex VI.

¹ See I. C (i) (b), vol. i, pp. 69-70, with Annex I, above.

ANNEX VIII TO II. D (vii)

THE FORFEITED BIRTHRIGHT OF THE ABORTIVE FAR EASTERN CHRISTIAN CIVILIZATION

We have found reason for believing that the capitulation of the embryonic Far Eastern Christendom to Islam in A.D. 737-41 was an event of historic importance. We may measure its importance by allowing ourselves to conjecture what might have happened if the Umayyads had left unretrieved their great defeat of A.D. 731 in the Pass between Kish and Samarqand, as they were content to leave the defeat which they suffered the year after at Tours. In that event, it is scarcely credible that the situation on the north-eastern front of the Arab Empire would have stabilized itself on the *status quo*. If the Arab frontier had not been carried forward, after A.D. 731, from the Murghab to the Jaxartes, it is improbable that the Arabs would have retained their hold upon Khurāsān. Within the next half-century, the independent principalities in Sughd and Tukharistan (reinforced by Türgesh and other adventurous Nomads off the Steppe) might have driven the Arabs back south-westward through Damaghan and the Caspian Gates, and have made the Dasht-i-Lūt the boundary between Far Eastern Christendom and Dār-al-Islām for the time being. But if the frontier had once moved back to that point, a comparison with the actual course of events on the north-western front of the Arab Empire, where the frontier actually did recede after the failure to retrieve the Battle of Tours, indicates plainly that the ebb of the Islamic wave in this quarter would eventually have gone very much farther than the Caspian Gates.

The strategic circumstances of the European and Central Asian fronts were curiously similar to one another. While the ultimate base of the Umayyad Power lay in Syria, it possessed two secondary bases, nearer to the respective fronts, in two rich lowlands—Andalusia in the one case and 'Irāq in the other—from which armies could draw abundant supplies. Beyond these friendly lowlands the Arab lines of communication had to traverse two comparatively arid and inhospitable plateaux—the Plateau of Castile in Europe, and the Plateau of Iran in Asia—and, on either plateau, the Arab lines were dangerously flanked to the left by a long, narrow strip of unconquered territory. The previous Western Christian masters of the Iberian Peninsula were still holding out in the narrow zone between the crest-line of the Asturian Mountains and the southern coast-line of the Bay of Biscay. The previous Zoroastrian masters

of Iran were likewise still holding out in the almost equally narrow (though much longer and altogether more extensive) zone between the crest-line of the Elbruz Mountains and the southern coast-line of the Caspian Sea.¹ In both cases these unconquered enclaves of hostile territory were dangerous—partly because they threatened a long and exposed flank; partly because they were natural fastnesses which it would be extremely difficult to occupy and subdue effectively in the teeth of a hostile population; but, most of all, because both enclaves were hemmed in by the Arab dominions on the landward side only, and were saved from the moral and material handicap of geographical isolation by the fact that they were in contact, by sea,² with more powerful opponents of the Arabs in still unconquered hinterlands.

The actual course of history in the north-west indicates what might have happened in the north-east had Qutaybah's work not been performed over again—and, this time, conclusively—by Asad and Nasr. Because, in A.D. 732, the Arabs lacked the will-power to complete the conquest of Aquitaine, the Austrasian Franks were able to join hands with the Asturians and to ensure that Asturia should be an advanced base for future Western counter-offensives against the Muslims. This was one of the objectives of Charlemagne's campaign which ended in A.D. 778 at Roncesvalles; and, in spite of that discomfiture, the objective had been achieved by A.D. 801, when Charlemagne's Spanish march was pushed forward beyond Barcelona.³ From that date onwards, the local Asturian front became part of a united front of Western Christendom; the ascendancy on the Iberian border had definitely passed from the Muslims to the Westerners; and there is nothing surprising in the developments of the next four centuries, which were consummated in A.D. 1235 by the conquest of Cordova and which resulted in the extinction of Muslim rule in every part of the Peninsula except the enclave of Granada.⁴

¹ In climate and vegetation the Elbruz range may be considered as being a detached and remote enclave of Northern Europe, and the sub-tropical coastal belt between the Elbruz and the Caspian as a similar enclave of India. We may compare with this the equally curious enclave of the Mediterranean climate along the eastern part of the south coast of the Black Sea, which also, of course, faces northward.

² At that time the main stream of the Oxus may possibly have flowed into the Caspian, and this would have afforded water transport all the way from Daylam to Sughd via Khwārizm. But, in any case, there was always a caravan-route between Khwārizm and the eastern coast of the Caspian. (For the variations in the course of the River Oxus, see Huntington, Ellsworth: *The Pulse of Asia* (London 1907, Constable), ch. xvii. The only period for which a discharge of part of the waters of the Oxus into the Caspian instead of into the Sea of Aral is satisfactorily attested is the period A.D. 1221–circa A.D. 1550 (op. cit., p. 350).)

³ See p. 362, above.

⁴ Conversely, what actually happened in the north-east enables us to reconstruct, with some confidence and even in some detail, the first stages of what would presumably have happened in the north-west had the fate of Aquitaine, like that of Transoxania, been decided between A.D. 732 and 741. With the Arab Empire permanently established in

On this showing, it is surely clear that, if the Far Eastern Christendom of Central Asia had survived the Islamic impact, the boundary between Dār-al-Islām and the new Central Asian World which would then have taken substance would not have stood permanently at the Caspian Gates. For while that narrow passage between desert and mountain is admirably protected by the nomad's-land of the Dasht-i-Lūt on the south, it is outflanked on the north by the fastnesses of Tabaristan and Daylam; and we have suggested already¹ that the Zoroastrians who were holding out in these fastnesses against the Arabs would have made common cause with the Nestorians and Manichaeans and Buddhists of Central Asia if the Central Asians had succeeded in turning back the tide of Arab conquest in the eighth century of the Christian Era. Even as it was, the Tabaris and Daylamis resisted conversion to Islam until the ninth and tenth centuries, and even then they only accepted their Arab enemies' religion in the unorthodox version of the Shi'ah. Had a previous turn of the tide encouraged them to hold out only a few years longer than they actually did, then, upon the break-up of the 'Abbasid Caliphate, the Buwayhids would duly have descended upon the Iranian Plateau from Daylam, but as Zoroastrians and not as Muslims and as conquerors of fresh territory for the nascent Central Asian Civilization at the expense of Islam, instead of their passage being a mere domestic incident in the last phase of Syriac history.

The progress of Central Asia at the expense of Dār-al-Islām would, no doubt, have gone steadily forward. Even if the Sunnis had made more effective efforts to save 'Irāq, or, at least, Baghdad itself, from the hand of a Buwayhid unbeliever than they actually made when the Caliph fell into the power of a Buwayhid sectarian, the Buwayhid's work would have been finished by a Zoroastrian or a Nestorian Saljūq; for, in the meantime, the Far Eastern Christen-

their rear, as well as in front of them, and with their co-religionists in Aquitaine apostasizing in increasing numbers to Islam, the Christians of the Asturian enclave could no more have resisted assimilation than the Zoroastrians of the Caspian Provinces found themselves able to resist it after the Arab conquest of Transoxania. The Asturians, like the Daylamites, Tabaris, and Jurjanis, would almost inevitably have been converted to Islam in the course of the ninth and tenth centuries of the Christian Era. It is true that such conversion, had it taken place, would not have prevented the Asturian mountaineers, in the course of the tenth century and thereafter, from issuing out of their fastnesses and beginning to push down across the Castilian Plateau towards the lowlands of Andalusia, as they actually did. That historical movement was a consequence of the growing social and political weakness, at that time, of the Arab Empire through its whole extent, both under Umayyad sovereignty in the Peninsula and under 'Abbasid sovereignty elsewhere. It was not affected by the religious factor, and the converted Daylamites therefore took the offensive in Iran simultaneously with the unconverted Asturians in the Peninsula. In the sequel, however, the religious factor made a world of difference. The Buwayhids, descending as Muslims (though as Muslims of the Shi'i persuasion), were not, by their conquests, diminishing the territories of Dār-al-Islām. For this reason, these conquests were not so fiercely opposed as those of the Christian Asturians, and were therefore not only more rapid in their extension, but also more superficial and transitory in their effects.

¹ On pp. 377-8, above.

dom would have become solidly established in between Dār-al-Islām and the Eurasian Steppe, and the Nomadic peoples who broke upon the Transoxanian coasts of the Steppe in the eruption of A.D. 975-1275 would therefore have been converted to Nestorianism and would have come, not as reinforcements, but as alien and destructive enemies to Islam. As it was, the Saljūqs, meeting Islam and succumbing to it in the Oxus-Jaxartes Basin, travelled on westward as Muslims and discharged their thunder upon Orthodox Christendom in Anatolia. If we may imagine them converted, in Transoxania, to Nestorianism instead, and meting out to a Muslim 'Irāq and Syria the treatment which they actually meted out to an Orthodox Christian Anatolia, we can estimate how disastrous the effect would have been for the destinies of Islam.

This, again, is not a fantastic conjecture, for, in the last phase of the post-Syriac Völkerwanderung, a catastrophe of this very kind actually did bring Islam to within an ace of destruction. The post-Syriac Völkerwanderung was contemporaneous with a period of effervescence on the Steppes; and on the Eurasian Steppe, in this period, the convulsions reached their maximum degree of intensity immediately before the disturbance died down altogether.¹ As the disorder worked up towards its climax, successive hordes of Eurasian Nomads were upheaved and discharged outwards from deeper and deeper recesses of Eurasia. The first elements discharged upon Dār-al-Islām were the occupants of the peripheral or 'in-shore' zone of the Steppe, of whom the Saljūqs may be taken as the leading example. Since, for a considerable period before their upheaval, these peripheral Nomads had been in contact with, and under the influence of, the religion then prevalent in Transoxania, and since, furthermore, that religion happened, owing to the decision of A.D. 741, to be not an unconquered Nestorian Christianity but the conquering religion of Islam, the Saljūqs had themselves become Muslims before the Völkerwanderung hurled them upon Muslim lands, and it has just been remarked how this previous assimilation rendered their invasion comparatively harmless to the invaded society. In the final and most convulsive phase of the eruption, however, the circumstances were not equally favourable from the Islamic point of view; for, in this phase, Dār-al-Islām was assailed by Nomadic invaders from the innermost depths of the Steppe—depths to which Islam, in spite of having conquered Transoxania, had not had time to penetrate during the five centuries which had since elapsed.

These depths, however (which lay in what are now Mongolia and Zungaria), had not been left unevangelized. In conquering the

¹ On this point, see further Part III. A, Annex II, below.

Oxus-Jaxartes Basin, Islam had, indeed, effectively prevented that region from becoming the centre of a new Far Eastern Christian Civilization based on an entente between all Islam's local rivals—Nestorianism and Buddhism and Manichaeism and Zoroastrianism—but she could not prevent these rival religions, whose future in Central Asia she had destroyed for any effective purpose of social construction, from drifting eastwards along the Central Asian corridor and establishing a curious, transitory, and abortive ascendancy over the minds of Uighurs and Naimans.¹ Indeed, it is possible that Muslim aggression against Sughd and Farghana hastened the conversion of the Far North-East to Manichaeism and Nestorianism² by causing a dispersion of Transoxanian refugees abroad among Nomad Gentiles.³ If so, the unborn civilization of Central Asia at any rate left a ghost in the shape of 'Prester John', and that ghost very nearly succeeded in taking its revenge upon the remote successors of those Muslim conquerors who, five centuries before, had cheated it of life in the flesh. It is doubtful whether there were any Buddhist or Nestorian elements in the original nucleus of Chingis Khan's Nomadic confederacy; and, even among the tribes on the pasture-lands immediately to the west of his, these elements were probably very small in numbers. They possessed, however, something like a local monopoly of technique and knowledge; the communities among whom they were found were incorporated into the Mongol community on terms more nearly approaching equality than any terms granted to remoter and more alien populations that were subsequently conquered; moreover, their incorporation occurred at a moment when Chingis' empire was assuming proportions which made the introduction of some kind of civil order a necessity—and thus it was that these few and scattered survivors of an abortive civilization were paradoxically raised to places of honour and influence round a throne which bade fair to dominate two continents.

Had this suddenly evoked spectre of the abortive Far Eastern Christendom succeeded in grasping the hand of the Western Christendom which (owing to the faint-heartedness of Arab empire-builders after A.D. 732) was by this time a creature of flesh and blood in all the aggressive lustiness of early manhood, it is hardly

¹ See II. D (vi), pp. 237-8, above.

² Buddhism, which travelled eastward and south-eastward to the Far Eastern World along the corridor of the Oxus-Jaxartes Basin and the Tarim Basin, does not appear to have penetrated the steppe-country to the north.

³ The ruling house of the Uighurs was converted to Manichaeism in A.D. 762-3: that is to say, twenty-one years after the definitive incorporation of the whole of Transoxania into the Arab Empire. In this case, however, the immediate source of radiation seems to have been the Manichaean Church which by this time had been established for a century in the Far East, and not the Manichaean Church in Transoxania. (See Cordier, H.: *Histoire Générale de la Chine* (Paris 1920-1, Geuthner, 3 vols.), vol. i, p. 500.)

possible to believe that Islam could have survived; and it is sometimes forgotten how very near to accomplishment this dramatic reunion of co-religionists, long sundered by the barrier of Islam, was several times brought, through overtures from both sides, in the course of the thirteenth century after Christ. The overthrow of the Khwārizm Shah in A.D. 1220 seemed at first sight to have cancelled, at one stroke, five centuries of Islamic effort in the Oxus-Jaxartes Basin; and the sack of Baghdad and the irreparable devastation of 'Irāq in A.D. 1258 by Hulāgū Khan were like mortal blows at the political and economic heart of the Islamic commonwealth. Now the project of Hulāgū's expedition appears to have been suggested to the mind of Hulāgū's overlord, the Khaqan Mangu, by the Uniate-Catholic King Hayton of Little Armenia; and it may have been Hulāgū's Nestorian wife who inspired him, in turn, to send his advance-guard across the Euphrates, in order to attack the Muslims in their last citadel of Egypt, under the command of the Nestorian general, Kit-Bugha.¹ In A.D. 1260, when Kit-Bugha captured Damascus and momentarily gave the local Monophysite and Orthodox Christians the dominion over their Muslim neighbours, the Western Crusaders were still clinging to Acre and a few other strongholds on the Syrian coast, and they were not blind to the possibilities which 'Prester John's' miraculous intervention might offer. Already Friar Giovanni di Piano Carpini had been sent to the Khaqan's court at Qaraqorum by Pope Innocent IV in A.D. 1246 and Friar William of Rubruck by St. Louis in A.D. 1253. Between 1260 and 1269 Marco Polo's father and uncle made their way to the same destination as private merchants, and returned as bearers of a letter to the Pope from the Khaqan. In 1271 they set out, this time from Acre, to make the journey to Qaraqorum again, bearing an answer from the Pope, and accompanied by Marco, and it was not till 1295 that they returned to Venice via the Indian Ocean. Meanwhile, a letter (still preserved) had been sent in 1295 by the Il-Khan Arghun to the Court of France, to be followed by another in 1305 from his son Uljaytu. Thus, during the latter half of the thirteenth century, the two deadly enemies of Islam came within measurable distance of co-operation. It was not till after the fall of Acre in 1291 and the successive failure of the second and third Mongol invasions of Syria in 1281 and 1303 that this possibility disappeared.

Such were the straits to which Islam was reduced in the last phase of the Nomad eruption and post-Syriac Völkerwanderung of A.D. 975-1275, and this although, as recently as A.D. 1220, Islam had been the dominant cultural and political force as far north-eastward

¹ See II. D (vi), p. 238, above.

as the Oxus-Jaxartes Basin. Supposing, however, that, five centuries earlier, that region had resisted assimilation and had developed an independent and aggressive civilization in the meantime on the lines suggested above, the eventuality which, in actual fact, only passed in a flash across the page of History as a picturesque possibility, would almost certainly have taken shape as a historical event of permanent importance. Supposing that, by A.D. 1220, Islam had already been driven west of the Euphrates, and that a new Far Eastern Christian Civilization had already extended its domain from that river on the south-west to the border of Chingis Khan's homelands in the opposite quarter, it is probable that the Buddhist-Nestorian culture, which exercised so marked an influence upon the twelfth- and thirteenth-century Mongols even in its dim and shadowy residue, would have captured them heart and soul, and that they would have made themselves its apostles as they went forth, conquering and to conquer, to the ends of the Earth. In that case the western bank of the Euphrates would have been Islam's first and last line of defence, and it is hardly conceivable that a single line would not have been broken. Had that breach occurred, Islam in the thirteenth century of the Christian Era would have suffered the fate of Orthodox Christendom in the eleventh. The Eastern and the Western Christian enemy would have united to storm her Egyptian citadel.¹ She would have become a submerged society, and by the twentieth century of the Christian Era she might only have been represented by such 'fossils' as now actually survive of the Gregorian and Jacobite Monophysites or of the Nestorians themselves.

¹ Just as in the eleventh century the Saljūqs and the Normans broke simultaneously upon the Orthodox Christian World from opposite quarters of the compass.

THE GROWTHS OF CIVILIZATIONS

A. THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS

The Arrested Civilizations

IN giving this chapter its title, are we not begging a question? And, if the question is raised, can we really maintain that the growths of civilizations present a problem at all? The problem of the geneses of civilizations is another matter. That problem is genuine beyond all doubt; and our attempts to solve it have exercised our minds severely. But if we may venture to suppose that these efforts have had any substantial measure of success, do we need to seek further? For does not any solution of the problem of birth dispose of the problem of growth *a priori*? When birth is once achieved, does not growth follow of itself? This is a question which has to be answered if our title is to stand. Let us turn, for an answer, to the empirical method of inquiry which has often stood us in good stead.

If we take a survey of civilizations that have duly come to birth—in contrast to those embryonic civilizations that have miscarried—do we find, as a matter of fact, that they have invariably grown thereafter in wisdom and in stature? Frequently—perhaps usually—they have gone on growing, no doubt. Our twenty-one specimens of this species of societies are cases in point. For although, in our day, all but seven of the twenty-one are extinct, and although the majority of these seven are now unmistakably in decay, it is evident, on the other hand, that even the shortest-lived and least successful of these twenty-one societies did achieve at least some measure of growth after it had come to birth. But the twenty-one developed civilizations¹ and the four abortive civilizations² are not the only examples of civilizations that an empirical survey reveals to us. If we now look further, we shall come across specimens of yet a third class. We shall find examples of civilizations which have not been abortive yet have not developed either, but have been arrested after birth. It is the existence of these arrested civilizations that justifies the title of the present chapter by presenting the problem which we have now set ourselves to solve. The first step

¹ See the list in vol. i, on p. 133, above.

² The Abortive Far Western Christian, Abortive Far Eastern Christian, Abortive Scandinavian, and Abortive Syriac. (See II. D (vii), vol. ii, pp. 322-94, above.)

2 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
towards solving it will be to collect as many specimens of arrested civilizations as we can.

We can readily lay hands on half a dozen specimens of the kind. Among the civilizations that have come to birth in response to physical challenges, there are the Polynesians and the Esquimaux and the Nomads. And, among the civilizations that have come to birth in response to human challenges, there are certain peculiar communities, like the 'Osmanlis in the Orthodox Christian World or the Spartans in the Hellenic World, which have been called into existence by local accentuations of the prevalent human challenges when these have been keyed up, through peculiar circumstances, to pitches of unusual severity. These are all of them examples of arrested civilizations; and we can see at once that they all present a picture of the same general predicament.

All these arrested civilizations alike have been immobilized in consequence of having attempted, and achieved, a *tour de force*. They are responses to challenges of an order of severity on the very borderline between a degree that still affords some stimulus and a degree that brings into operation the law of diminishing returns.¹

In the imagery of our fable of the climbers' pitch,² the representatives of the arrested civilizations are like climbers who happen to have started to scale the precipice in places where they are brought up short, at an early stage, against beetling projections on the face of the cliff. In these circumstances, a timid or a clumsy climber might have lost his hold and fallen, while a more prudent or a less obstinate climber might have redescended to the ledge from which he had just taken off, in order to try his fortune again at another point, or else to rest, unambitiously, from his labours. These actual climbers, however, have been neither defeated, nor daunted, nor inspired with that wisdom which is the better part of valour, by the unexpected and formidable obstacles that they have encountered. They have accepted their challenge as they have found it, grasped the projecting rock, and levered themselves over it, outwards and upwards, with a movement of magnificent audacity and vigour and skill. But though the gesture is magnificent, it is not good climbing; for it entails a consequence which the expert climber is ever on the look out to foresee and to avoid. The expert climber is on his guard against making any move that will preclude him from moving on; and our over-audacious climbers cannot break this rule with impunity. They grapple with the jutting crag, only to find them-

¹ In concrete terms, they are responses to challenges of an intermediate degree of severity between the challenge that stimulated the Achaeans to create the Hellenic Civilization and the challenges which were just too severe to allow the Irish and the Norsemen to bring the Abortive Far Western Christian and the Abortive Scandinavian Civilization to birth.

² See II. B, vol. i, pp. 192-5, above.

selves, the next moment, clinging to the crag's projecting face in a rigid posture from which they dare not budge. Their superabundant skill and vigour and boldness is now all absorbed in a supreme effort to save themselves from falling, and they have no purchase, and no margin of energy, for climbing on until they have rounded the formidable projection and reached a normal surface again. Their motto—and eventual epitaph—is 'J'y suis, j'y reste'. They are performing an astonishing acrobatic feat, but a feat in the realm of Statics and not in the realm of Dynamics. In fact, these arrested civilizations, unlike the primitive societies, are real instances of 'peoples that have no history'.¹ Immobility is their unalterable posture, so long as they are what they are. They become what they are by grappling with the projecting crag; they remain what they are by gripping the crag so close that their once free and supple bodies mould themselves stiffly into all the contours of the rock; and they cease to be what they are when they either turn to stone and merge into the crag to which they have clung, or else drop, like a stone, from exhaustion.

This common posture of perilous immobility at high tension may be observed, in the several examples that we have cited, under the widest variety of conditions.

The Polynesians, for instance, ventured upon the *tour de force* of Oceanic voyaging. Their skill was to perform these stupendous voyages in frail open canoes. Their penalty has been to remain in an exact equilibrium with the Pacific—just able to cross its vast empty spaces, but never able to cross them with any margin of security or ease—until the intolerable tension has found its own relief by going slack, with the consequence that these former peers of the Minoans and the Vikings have degenerated into incarnations of the Lotus-Eaters² and the Doasyoulikes:³ losing their grip upon the Ocean and resigning themselves to be marooned, each in his own insular paradise, until the Western mariner comes at last from the ends of the Earth to exterminate them as he exterminates the Arctic hunters' seals or the prairie hunters' bison.⁴ We need not dwell here upon the Polynesians' latter end, since we have touched upon it already apropos of Easter Island.⁵

¹ For the unrecorded, but not unacted, history of the primitive societies, in the Yang-activity which must have preceded their present Yin-state, see I. C (iii) (e), vol. i, pp. 179-80, above.

² See II. D (i), vol. ii, pp. 22-3, above.

³ See II. D (i), vol. ii, pp. 25-31, above.

⁴ The decimation of the Polynesians by the Western 'beach-combers' has not, of course, been deliberate; yet the bullet and the harpoon which have done such execution among the non-human fauna of North America are not so deadly to Primitive Man as the germs of contagious diseases which the Westerner involuntarily brings—not to speak of the profound devitalizing influence which the Westerner's very spiritual presence exerts upon the Primitive who suddenly comes into social contact with him.

⁵ See II. D (i), vol. ii, pp. 12-15, above.

4 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS *The Esquimaux*

As for the Esquimaux, 'the Palaeeskimo Culture was an original North Indian form of culture, the winter side of which had become specially and strongly developed by adaptation to the winter ice of the Arctic Ocean.¹ . . . The essential impulse to the development of the Eskimo Culture did not come until the Eskimo accustomed themselves to stay at or on the sea ice in the winter and hunt seals.² This was the Esquimaux's *tour de force*; and the stimulus which excited them to achieve it seems, on the whole, more likely to have been the attraction of economic advantage than the pressure of human aggressors.

'It might be asked whether the pre-Eskimo advance towards the north, to the Tundra and the Archipelago, took place voluntarily or was due to pressure from southern neighbours. One will probably never be able to decide the question. But . . . it is to be strongly emphasized that life at the Arctic sea-coast, far from indicating a step backwards, in reality indicated a step forwards as regards economy, inasmuch as, in addition to the hunting of terrestrial mammals and summer fishing in the fresh waters, which was already known, the practice of hunting aquatic mammals was acquired as compensation for the ice fishing on lakes and streams. The contrast between this fishing on the ice of lakes, which was only resorted to in times of need, and the sea ice hunting of seals, gives a kind of standard of progress. One can then very well imagine that no pressure has been necessary, but that the pre-Eskimo have been tempted on to the coasts of the Arctic Ocean by natural conditions.'³

Whatever the historical incentive may have been, it is evident that, at some point in their history, the forefathers of the Esquimaux grappled audaciously with the Arctic environment and adapted their life to its exigencies with consummate skill.

'It is [the] natural conditions in the [Arctic] Archipelago, or, to put it more exactly, in the coast and sea regions between the mainland and the islands, which have been able to force a slow hunting people such as the ancient Eskimo must have been to undertake so thorough a cultural change as that which the modification of the Eskimo Culture must necessarily have required.'⁴

The skill evoked in the Esquimaux by this formidable problem of adaptation is justly celebrated. 'As regards certain dexterities, they really furnish an example of the utmost effort of human ability';⁵ and, to prove the point, it is only necessary to recite the catalogue

¹ Steensby, H. P.: *An Anthropological Study of the Origin of the Eskimo Culture* = *Saertryk af Meddelelser om Grønland LIII* (Copenhagen 1916, Lunos), p. 186.

² Steensby, op. cit., p. 205.

³ Steensby, op. cit., p. 206.

⁴ Steensby, op. cit., p. 168. For the evolution of the Esquimaux's most characteristic piece of technical apparatus, the kayak or sealskin canoe, from the North American Indian birch-bark canoe, see auct. cit., op. cit., p. 162.

⁵ Steensby, op. cit., p. 41.

of the material appliances which the Esquimaux have elaborated or invented: 'kayak, umiak (women's boat), harpoon, and bird-dart with throwing board, the three-pronged salmon spear, the compound bow, strengthened by a backing of sinews, the dog sledge, the snow shoe, the winter house and snow house with the lamps for burning blubber oil, and the platform, the summer tent, and lastly the skin garments.'¹

These are the outward and visible signs of an amazing feat of wit and will; yet

'in certain directions, for instance as regards social organization, the Eskimo display somewhat inferior development. But it is a question whether this inferior social differentiation is due to primitiveness, or whether it is not rather a result of the natural conditions under which the Eskimo have lived from time immemorial. No deep knowledge of the Eskimo Culture is needed to see that it is a culture which has been obliged to employ an immensely large part of its force simply to develop the means wherewith to gain a livelihood.'²

The penalty which the Esquimaux have had to pay for their audacity in grappling with the Arctic environment and compelling it to yield up its latent economic riches, has been the rigid conformation of their life to the annual cycle of the Arctic climate. 'All the bread-winners of the tribe are obliged to carry on different occupations at the different seasons of the year';³ and the tyranny of Arctic Nature imposes almost as exacting a time-table upon the Arctic hunter as is imposed on any factory worker of the temperate zone by the human tyranny of 'scientific management'.⁴ A distinguished student of the Eskimo Culture has made out this time-table, in two local variants, as follows:⁵

Arctic Eskimo Culture.

<i>Season.</i>	<i>Place of Abode.</i>	<i>Occupation.</i>	<i>Principal Implements.</i>	<i>Dwelling.</i>
Winter	In the beginning of winter, the coast land; later in the winter, the sea ice.	Hunting on the sea ice.	Dog sledge, Harpoon.	In the beginning of winter, earth house; later in the winter, snow house.
Summer	Inland.	Hunting on land and fishing in rivers.	Kayak, Lance, Bow and Arrow, Salmon Spear.	Tent.

¹ Steensby, *op. cit.*, p. 43. For a systematic and detailed survey of the ingenuities by which the Esquimaux have adapted their life to their physical environment, see Weyer Jr., E. M.: *The Eskimos: Their Environment and Folkways* (New Haven 1932, Yale University Press), ch. iv.

² Steensby, *op. cit.*, p. 42.

³ Steensby, *op. cit.*, p. 156.

⁴ 'There is hardly another people in the world whose self-maintenance *mores* are so strictly regulated by the changes in the seasons.' Weyer, *op. cit.*, p. 79.

⁵ Steensby, *op. cit.*, pp. 157-8. Compare the more elaborate chart in Weyer, *op. cit.*, on pp. 80-2 (fig. 11), which illustrates the author's account of the 'Seasonal Life-Cycle of Eskimos' in ch. v, § 1.

Sub-Arctic Eskimo Culture.

<i>Season.</i>	<i>Place of Abode.</i>	<i>Occupation.</i>	<i>Principal Implements.</i>	<i>Dwelling.</i>
Winter	The coast.	Hunting in Kayaks.	Kayak, Harpoon, Umiak.	Earth house.
Summer	Inland (otherwise the coast).	Inland hunting, fishing in rivers.	Kayak, Lance, Salmon Spear, Bow and Arrow.	Tent.

Another Western anthropologist, who has lived through this Arctic annual cycle himself by sharing the life of the Esquimaux of Coronation Gulf, has described the sharp transition from one seasonal rhythm to another as he encountered it in his own personal experience.

'A fortnight's fishing exhausted the bay and compelled us to make another move. It mattered little which way we turned, for every ridge bounded a lake that contained both trout and salmon. But since the total catch would be greater if we scattered our forces and settled on different lakes, the families separated. . . .

'This dispersal of the individual families completed one-half of the strange cycle through which the Eskimos passed year after year. They reacted to the seasons, to their constantly changing environment, more than most of the inhabitants of our globe. The problem of obtaining life's basic needs—food, clothing, and shelter—left little time for other thoughts; and the seals and caribou, that furnished them with food, furnished also the materials for clothing and tents. In winter, when the land lay bare and silent beneath the snow, when the caribou had migrated south, when the twilight hours were brief and the nights long, the natives had banded together into tribes, and tribe combined with tribe to wrest a precarious livelihood from the frozen sea by united effort. Food had been common to all, and their snow-houses had adjoined each other so closely that the families seemed absorbed in the group. With the returning sun and lengthening days, Nature had recalled its life;¹ the seals had appeared on top of the ice, the caribou had come northward again, and the tribes of Eskimos had broken up into little bands. For a time they had lingered on the ice to hunt more seals; then, turning landward, they had pursued the caribou over the snow-covered hills and plains. Now the snow was vanishing, the caribou had scattered, and fish alone provided a sure livelihood until midsummer. So my party, like many another throughout the country, was dividing into its constituent households, each of which now toiled for itself alone. The tribe no longer existed; Society had dissolved into its first element, the family.²

As we ponder over the scene which is here so vividly depicted,

¹ Weyer points out, in *op. cit.*, on pp. 20 and 28-9, that in the Esquimaux's habitat the transition from winter to summer is abrupt, while the transition from summer to winter is relatively gradual.—A.J.T.

² Jenness, D.: *The People of the Twilight* (New York 1928, Macmillan Company), pp. 136-7.

we may be inclined to ask ourselves whether the Esquimaux are the Masters of Arctic Nature or her slaves. We shall meet with an equivalent question, and find it equally difficult to answer, when we come to examine the lives of the Spartans and the 'Osmanlis. Meanwhile, we have still to consider the fate of another arrested civilization which has been evoked by a physical challenge, before we pass on to examine those which human challenges have brought to birth.

The Nomads

The *tour de force* of the Esquimaux has been to take up the challenge of the Ice and the *tour de force* of the Polynesians to take up the challenge of the Ocean. The Nomad, who has taken up the challenge of the Steppe, has had the audacity to grapple with an equally intractable element; and indeed, from the social (as distinct from the physiographical) point of view, the Steppe, with its surface of grass and gravel, actually bears a greater resemblance to 'the unharvested sea'¹ than it bears to terra firma that is amenable to hoe or plough. Steppe-surface and water-surface have this in common, that they are both accessible to Man only as a pilgrim and a sojourner. Neither offers him anywhere on its broad expanse (apart from the islands and oases) a place where he can rest the sole of his foot and settle down to a sedentary existence. Both provide strikingly greater facilities for travel and transport than those parts of the Earth's surface upon which human communities are accustomed to live in permanence;² but both exact (as the penalty for trespassing upon them) the necessity of constantly 'moving on', or else 'moving off' their surface altogether and finding some standing ground upon terra firma somewhere beyond the coasts which respectively surround them. Thus there is a real similarity between the Nomadic horde which annually follows the same orbit of summer and winter pasture-ranges, and the fishing-fleet which cruises from bank to bank according to the season; between the convoy of merchantmen which exchanges the products of the opposite shores of the sea, and the camel-caravan by which the opposite shores of the Steppe are linked with one another; between the water pirate and the desert raider; and between those explosive movements of population which impel Norsemen or Minoans or Crusaders to take to their ships and to break like tidal waves upon the coasts of Europe or the Levant, and those other movements which impel Imoshagh or Arabs or Scythians or Turks or Mongols to

¹ 'Unharvested' (*ἀρπύγρος*) is one of the stock epithets of the sea in the Homeric Epics.

² For the light thrown upon this question of relative 'conductivity' by a study of the geographical distribution of languages, see III. A, Annex I, below.

8 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
swinging out of their annual orbit on the Steppe and to break, with equal violence and equal suddenness, upon the settled lands of Egypt or 'Irāq or Russia or India or China.

It will be seen that the Nomads', like the Polynesians' and the Esquimaux's, response to the challenge of Physical Nature is a *tour de force*; and in the case of the Nomads the historical incentive to this *tour de force* is not, as in the case of the Esquimaux, altogether a matter of conjecture. We are entitled to infer that Nomadism was evoked by the same challenge that evoked the Egyptian and the Sumeric civilizations and that drove the forefathers of the Shilluk and the Dinka into Equatoria and the forefathers of the Norsemen into Scandinavia. Nomadism, likewise, may be conceived as having arisen in response to the searching challenge of desiccation; and we have touched upon its possible origins already incidentally, in inquiring into the origins of the fluvial cultures.¹ The origins of the Nomadic Civilization, as well as those of the sedentary civilizations which have arisen in the same arid zone, are illuminated by the discoveries of modern Western Archaeology;² and the clearest light which we have upon Nomadism, up to date, has been thrown by the researches of the Pumpelly Expedition in the Transcaspian oasis of Anau:³ a site in the extreme south-western corner of the Eurasian Steppe, at the foot of the north-eastern escarpment of the Iranian Plateau.

In the Transcaspian oases, as in the river-valleys of the Lower Tigris and Euphrates and the Lower Nile,⁴ we find the challenge of desiccation, in its first incidence, stimulating certain communities which had formerly lived entirely by hunting to eke out their livelihood under less favourable conditions by taking to a rudimentary form of agriculture.

'With the gradual shrinking in dimensions of habitable areas and the disappearance of herds of wild animals, Man, concentrating on the oases and forced to conquer new means of support, began to utilize the native plants; and from among these he learned to use seeds of different grasses growing on the dry land and in marshes at the mouths of larger streams

¹ See II. C (ii) (b) 2, vol. i, pp. 304-5, above.

² On this point, a cautionary note has been communicated to the writer of this Study by Mr. G. F. Hudson: 'Nomadism has to be carefully distinguished from the keeping of domestic animals by sedentary folk, and the archaeological evidence only refers to the latter. I think it is very probable that both intensive agriculture and animal-domestication began in oases as a result of a process of desiccation, namely the drying-up of North Africa, Arabia, and Iran when the climatic belts shifted north at the end of the Ice Age—though even this is rather conjectural. Nomadism, on the other hand, was a development about which we have not, and cannot have, satisfactory archaeological evidence.'

³ Pumpelly, R.: *Explorations in Turkestan: Expedition of 1903* = Carnegie Institution Publication No. 26 (Washington, D.C., 1905, Carnegie Institution); auctor idem: *Explorations in Turkestan: Expedition of 1904: Prehistoric Civilizations of Anau* = Carnegie Institution Publication No. 73 (Washington, D.C., 1908, Carnegie Institution, 2 vols.).

⁴ See II. C (ii) (b) 2, vol. i, pp. 305-18, above.

on the desert. With the increase of population and its necessities, he learned to plant the seeds, thus making, by conscious or unconscious selection, the first step in the evolution of the whole series of cereals.¹

Whether agriculture in Transcaspia was an independent invention or a loan from the Indus Valley or from Sumeria is not apparent. Archaeology simply reveals that, at Anau North Kurgan, 'they cultivated cereals from the beginning'² and that agriculture was already the mainstay of the earliest inhabitants that have left their mark on the local archaeological record,³ though 'at first, besides cultivating the soil, they' still 'hunted wild animals'.⁴

Thus, in Transcaspia, agriculture supervened directly upon hunting, and thereafter these two methods of obtaining a subsistence were practised there simultaneously side by side. The most significant fact, however, which archaeological research at Anau had brought to light is the fact that 'the agricultural stage preceded domestication and [thus preceded] the Nomadic shepherd stage of civilization'.⁵

'At the time when the lowest layers of the North Kurgan at Anau were formed, Man lived in this region entirely without domestic animals. The mighty wild ox (*Bos namadicus* Falconer and Cautley) and the small wild horse—possibly in the form that Wilckens thought he discovered among the finds of Maragha in Persia, or in that of *Equus przewalskii*—roamed on the steppes and the oases of the Kara Kum desert and sought shelter in the forest which probably then occupied the valleys and slopes of the Kopet Dag. There lived, too, the large-horned wild sheep (*Ovis vignei arkal* Lyddeker) and the gazelle (*Gazella subgutturosa* Gueldenstedt). From the absence of all stone weapons in the oldest period, we may conclude that Man lived on a friendly footing with these animals and that he could gain possession of them only by depriving the wolves of their prey or by the use of fire-hardened wooden weapons. . . . It would be guess-work to attempt to picture the method of domestication and to assume . . . that the wild horse, the wild sheep, and the wild ox voluntarily (or compelled by the necessity of food from outside the oasis) approached human dwellings in order to graze on the weeds and other plants, and so were gradually brought into companionship with Man, who then assumed the care of their nourishment. We know only that after the accumulation of the lowest ten feet of the strata in the North Kurgan this same ox occurs in an almost equally large, but certainly a domesticated form, becoming more and more frequent in the higher

¹ Pumpelly, op. cit., *Expedition of 1904*, vol. i, pp. 65-6.

³ Pumpelly, op. cit., *Expedition of 1904*, vol. i, p. 39.

⁴ 'While the bones of these, as well as those of the animals which they domesticated later, show that they ate the flesh of these, including the pig and probably also the fox and the wolf, these bones are not sufficiently abundant to prove that meat formed by any means the chief part of their diet.' (Op. cit., loc. cit.)

⁵ Pumpelly, op. cit., *Expedition of 1904*, vol. i, p. xxviii.

10 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
strata, when the horse and the sheep also pass over into the domesticated condition.¹

Thus the first turn of the climatic screw in Eurasia not only stimulated a society which had formerly lived by hunting to take to agriculture. It also had another—indirect but not less important—effect upon the social history of these *ci-devant* hunters who had made this first successful response to its challenge. By stimulating them to turn to agriculture instead of hunting as their staple source of food-supply, it gave them the opportunity to enter into a wholly new relation towards wild animals. For the art of domesticating wild animals, which the hunter, by the very nature of his occupation, is unable to develop beyond narrow limits, has vastly greater potentialities in the hands of the agriculturist. The hunter may conceivably domesticate the wolf or jackal with whom he disputes or shares his prey by turning the wild beast into a partner in the hunter's own human predatory activities. But it is virtually inconceivable that the hunter should succeed in domesticating the game which is his quarry and his victim. It is not the hunter with his hound but the *ci-devant* hunter, transformed into an agriculturist with his watch-dog, who has it in his power to accomplish the further transformation which brings into existence the shepherd with his sheep-dog. The agriculturist enjoys a double advantage for this purpose. Unlike the hunter, he is not preying upon the wild animals and therefore is not inspiring them with a deadly fear of his presence; and, unlike the hunter again, he possesses food-supplies which are attractive to ruminants like the ox and the sheep, which 'would not, like dogs, be attracted by meat or other products of a hunting or fishing life'.²

Archaeological research at Anau indicates that this further step in social evolution had been accomplished in Transcaspia by the time when Physical Nature gave her screw its second turn. The first spasm of desiccation had found Eurasian Man a hunter and nothing else; the second spasm found him a sedentary cultivator and stock-breeder, with his hunting reduced to a subsidiary means of livelihood. In these circumstances, the challenge of desiccation, when it was now redelivered with greater insistence than before, evoked two new and diverse human reactions. By achieving the domestication of ruminants, Eurasian Man had potentially recovered the mobility which he had forfeited in his previous metamorphosis from a hunter into a cultivator; and, in response to the fresh incidence of the old challenge, he made use of his new-found mobility in two quite different ways.

¹ Duerst, J. U., in Pumpelly, *op. cit.*, *Expedition of 1904*, vol. ii, p. 435.

² Duerst in Pumpelly, *op. cit.*, *Expedition of 1904*, vol. ii, p. 437.

Some of the Transcasian oasis-cultivators simply used their mobility in order to emigrate progressively—moving ever further on as the climatic trend towards desiccation increased in severity at the heart of the Steppe and in range on the periphery—so as always to keep abreast of a physical environment in which they could continue to practise their existing way of life without being constrained to revolutionize it once again.

'The establishment of the first domestic breeds of pigs, long-horned cattle, large sheep, and horses was followed by a deteriorating climate which changed these to smaller breeds. The climatic deterioration, by diminishing the productivity of the fully-peopled oases, caused unrest and migrations of agriculturists. . . . Dr. Duerst identifies the second breed of sheep [at Anau] with the turbary sheep (Torfschaf) and the pig with the turbary pig (Torfschwein), which appear towards the end of the Neolithic period in the Swiss lake-dwellings and other Neolithic stations of Europe, already as domestic animals and unaccompanied by any transitional forms that might indicate local origins. These animals must therefore have been descendants of those domesticated on the oases of the Anau district. The turbary breed was established not later than towards the end of the oldest settlement of the North Kurgan. . . . It was formed during the part of the climatic cycle in which prevailed those conditions, unfavourable to nutrition, to which the breed owed its stunted character. Its characteristic features became firmly fixed during the subsequent existence of many generations after transference to a Nomadic life on the arid plains during the dry extreme of the cycle. And the firm establishment of the characteristics of the breed is proved by the persistence down to the present time; for it still exists at one point in the high Alps of the Grisons in Switzerland, and in Wales.'¹

This was one reaction to the recurring challenge of desiccation in Eurasia. But these cultivators and stock-breeders who trekked away across the withering Steppes with their seed-corn and their cattle, in order to find new homes where they could sow and reap and breed and pasture under the old conditions, had brethren who parted company with them at this point in order to respond to the same challenge in a more audacious fashion. These other Eurasians likewise abandoned the now untenable oases and launched them-

¹ Pumpelly, *op. cit.*, *Expedition of 1904*, vol. i, pp. 67-8. Mr. G. F. Hudson comments as follows: 'In this passage it seems to be suggested that the pig of Neolithic stations in Europe (turbary pig) was brought by emigrants from the Anau district via the desiccated Steppe. But swine-breeding is absolutely unknown to Steppe-Nomadism, for pigs cannot be kept on the Steppe at all unless they are specially fed. Swine-breeding has in historical times been characteristic of forest regions at both ends of the Eurasian Steppe (in Europe and in China and Manchuria), but not at all of the Steppe itself. Thus if, as Duerst holds, the Anau pig is the turbary pig, it must have come from the Anau district by way of Northern Iran and Asia Minor—which is otherwise probable in view of the southern affinities of the early "Danubian" culture.' [For this highland route of migration, see II. C (ii) (b) 2, vol. i, pp. 324-7, above.—A.J.T.] 'Or it may be that both the Anau and the Swiss breed were derived originally from a culture-centre west of Anau; so very little of Asia Minor and Transcaucasia has as yet been explored archaeologically. Anyway, I protest against the pig being brought across the Steppes!'

selves and their families and their flocks and their herds upon the inhospitable surface of the Steppe. But these other men did not embark upon the Steppe as timid fugitives seeking to reach and pass its boundaries and so escape from its clutches. They abandoned their former staple occupation of agriculture, as their agricultural forefathers had once abandoned their former staple occupation of hunting, and staked their existence upon their latest-acquired economic art, which, this time, was the art of stock-breeding. They flung themselves upon the Steppe not in order to escape beyond its bounds, but to make themselves at home upon it *en permanence* and to wrest a livelihood from it under physical conditions which were more inimical to life than any which had yet prevailed on the Steppe since Man had first set foot on it. 'Through the accomplished domestication of ruminants, men obtained freedom of motion for travelling with cattle after good pasture, and commenced a Nomadic life. This must be the real explanation of the origin of the wandering peoples.'¹

It will be seen that the Nomad's response to the challenge of recurring and increasing desiccation is a *tour de force* indeed. At the first onset of desiccation, the Nomad's pre-agricultural forefathers had abandoned their hunting-grounds on the Steppe and had retreated to the oases, where they took to agriculture as their staple source of food supply and looked to their former hunting grounds for no more than a subsidiary supply from that time onwards. And now, when the rhythmic process of desiccation, in its next onset, has made life still more difficult in the oases, and more difficult on the Steppe *a fortiori*, the patriarchs of the Nomadic Civilization audaciously return to the Steppe in order to wring out of it, now, no mere subsidiary supply but their entire livelihood—and this under climatic conditions under which the hunter and the

¹ Duerst, in Pumpelly, *op. cit.*, *Expedition of 1904*, vol. ii, p. 437. Duerst also notes, in *loc. cit.*, that 'among the Turkomans of to-day occur also cultivators of soil and breeders of cattle designated as Chomru and Chorva who intermarry and whose children choose either the life of Nomads or of farmers'. In a communication to the writer of this Study, Mr. G. F. Hudson questions whether the hypothesis of a second turn of the climatic screw (see p. 10, above) is necessary to account for the transformation of the sedentary stock-breeders who had come into existence in the oases into the Nomadic stock-breeders on the Steppes. 'We have no date, even approximate, established for the beginning of Nomadism, and we do not know of any period of desiccation which would be adequate thus to displace the oasis-dwellers after the winding-up of the Ice Age—unless it be the so-called Sub-Boreal period; and this is too late, as the Steppe seems already to be full of Nomads at this time. The facts can surely be explained just as well by supposing an analogy with the case of the Esquimaux, which you have put convincingly. The Esquimaux launched themselves on the Arctic ice, not because there was a spread of the ice (which would correspond to the desiccation hypothesis for Nomadism), but because they found a way of living off the ice which had previously been uninhabitable. In the same way, when animals had once been domesticated (the original domestication having been probably due to the desiccation, as you suggest), the herdsmen would sooner or later have found that by migrating so as to use seasonal pasture they could live off the Steppe, which had previously been either uninhabited or thinly peopled by roaming hunters. Thus no second desiccation is necessary for the theory.'

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 13

cultivator alike would find life on the Steppe quite impossible. The Nomad grapples with the arid Steppe in the strength of his new-found pastoral art; but, in order to practise this art successfully under these exceedingly exacting conditions, he has to develop a special skill; and, in order to exercise this skill, he has also to develop special moral and intellectual powers.

When we compare the civilization of the Nomad who has abandoned agriculture and has held his ground on the Steppes with the civilizations of his brethren who have preserved their agricultural heritage by changing their habitat, we shall observe that Nomadism displays a superiority over Agriculture in several ways.

In the first place, the domestication of animals is manifestly a higher art than the domestication of plants, inasmuch as it is a triumph of human wit and will over a less tractable material. The power of physical locomotion and the direction of this power by volition are the two main points in which Fauna differs from Flora; and these two characteristics, which Man's fellow-animals share with Man himself, evidently make the Animal Kingdom a less easy realm than the Vegetable Kingdom for Man to conquer. In other words, the shepherd is a greater virtuoso than the husbandman, and this truth has been expressed in a famous passage of Syriac mythology.

'Adam knew Eve his wife; and she conceived, and bare Cain. . . . And she again bare his brother Abel. And Abel was a keeper of sheep, but Cain was a tiller of the ground. And in process of time it came to pass that Cain brought of the fruit of the ground an offering unto the Lord. And Abel, he also brought of the firstlings of his flock and of the fat thereof. And the Lord had respect unto Abel and to his offering; but unto Cain and to his offering he had not respect.'¹

In fact, the art practised by Abel, the afterborn, is not only posterior in the time of its invention to the art of Cain, the elder brother; and it is not only an art of greater skill and greater difficulty. Nomadism is also superior to Agriculture economically; and from this technical standpoint it is comparable not so much with Agriculture itself as with Industrialism: another newfangled economic system which, like Nomadism, has differentiated itself out of a rudimentary agricultural economy in course of time and in response to a novel challenge. Whereas the cultivator produces raw materials which he can consume directly, the Nomad, like the Industrialist, makes his living out of raw materials which are of no utility to Man until they have been deliberately transformed. The cultivator lives off artificial grasses which he eats himself. The Nomad manages to live off natural grasses which he cannot eat himself—the coarse

¹ Gen. iv. 1-5.

14 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
and scanty herbage of the Steppe—by causing these non-human foodstuffs to be eaten by his tame animals and then feeding himself on these animals' milk and flesh, and clothing himself in their wool and hides.

And this indirect utilization of the vegetation of the Steppe through an animal medium makes demands on human wit and will which go far beyond the bare knowledge of the domesticator's art. If a shepherd or herdsman who had grown up in a sedentary society were suddenly put in charge of the Nomad's flocks and herds in the Nomad's environment, he would find himself almost as helpless as a vine-dresser or a ploughman; for the shepherd of the Steppes has no meadows to yield him hay for winter fodder, and no brother-husbandman to provide him with cattle-food by artificial cultivation, and no brother-industrialist to transform an unwieldy truss of soya-beans into handily portable oil-cake. In season and out of season, the Nomad must find subsistence for his cattle from the natural vegetation of the barren and parsimonious Steppe; and he can only find it by adapting his life and his movements meticulously to the vagaries of a severe and unfriendly physical environment. He must manœuvre himself and his family and his flocks and his herds over the vast spaces of the Steppe from winter-pasture to summer-pasture and from summer-pasture back to winter-pasture again in conformity with the climatic and vegetational year-cycle; and the Nomad patriarch cannot wrest victory out of this annual economic campaign without exercising—and exacting from the human beings and animals under his patriarchal authority—those virtues of forethought and self-control and physical and moral endurance which a military commander exercises, and exacts from his troops, when Man is at war with Man and not with Physical Nature.

Thus the material *tour de force* of Nomadism demands, from those who take the responsibility on their shoulders, a rigorously high standard of character and behaviour. They must combine the pastoral with the military virtues. They must know, by sure intuition, when to be benevolent and when to be severe; when to be prudent and when to be prompt in action. It is no wonder that the Christian Church has found in the everyday life of the Nomadic Civilization a symbol for the highest Christian ideal: the image of 'the Good Shepherd'.¹ It is also no wonder that the very achievement of so great a *tour de force* should have doomed the society that

¹ For the Nomadic origin of this image, see II. D (vii), vol. ii, p. 317, footnote 1, above. It is found alike in the Semitic languages of the Afrasian Nomads (e.g. the Arabic ) and in the Indo-European languages of the Eurasian Nomads (e.g. the Greek ποιμένα λαών).

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 15
has accomplished it to atone for its audacity by paying a penalty of equivalent magnitude.

The Nomads' penalty is in essence the same as the Esquimaux's. The formidable physical environment which they have succeeded in conquering has insidiously enslaved them in ostensibly accepting them as its masters. The Nomads, like the Esquimaux, have become the perpetual prisoners of an annual climatic and vegetational cycle;¹ and in acquiring the initiative on the Steppe they have forfeited the initiative in the World at large. The Nomads have not indeed passed across the stage of the histories of civilizations without making their mark. From time to time they have broken out of their own domain into the domains of neighbouring sedentary civilizations, and on some of these occasions they have momentarily carried all before them and have turned their sedentary neighbours' lives upside down; but these outbreaks have never been spontaneous. When the Nomad has issued out of his Steppes and has trespassed upon the cultivator's garden, he has not been moved by a deliberate intention to depart from his customary cyclic annual manœuvres. The violence of his occasional aberrations is not the expression of a demonic will-power, but the effect of powerful external forces which the Nomad is obeying mechanically. There are two such external forces to which he is subject: one force which pushes, and another force which pulls. The Nomad is occasionally pushed off the Steppe by a fresh turn of the climatic screw which intensifies the pressure to a degree which even the trained and hardened steppe-dweller cannot endure; and again he is occasionally pulled out of the Steppe by the suction of a social vacuum which has arisen in the domain of some adjacent sedentary society through the operation of historic processes, such as the breakdown and disintegration of a sedentary civilization, which are quite extraneous to the Nomad's own experiences. A survey of the great historic interventions of the Nomads in the histories of the sedentary civilizations seems to show that these interventions can all be traced to one or other of these two mechanical causes, and that they are not attributable to any active and positive responses, on the Nomads' part, to challenges arising out of any inner evolution in their own Nomadic life.²

Thus, in spite of these occasional eruptions out of the Steppe and

¹ In one sense, the Nomads are freer than the Esquimaux; for, 'unlike pastoral peoples, who lead their domesticated animals in quest of grazing grounds and water, the Eskimos are themselves led hither and thither by the animals, which follow their natural instincts'. (Weyer, *op. cit.*, p. 99.) 'It cannot be maintained, however, simply from the failure of the Eskimo to domesticate the caribou, for instance, that he is culturally inferior to all pastoral peoples. His indirect mastery over the animals in their wild condition displays a more highly developed cultural adaptation than do the simple adjustments of some herding peoples.'

² A survey of this kind is attempted below in Part III. A, Annex II.

16 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
incursions into the field of historical events, Nomadism is essentially a society without a history. Once launched on its annual orbit, the Nomadic horde revolves thereafter round the same identic track and might continue to revolve in *saecula saeculorum* if an external force against which Nomadism is ultimately defenceless did not eventually bring the horde's movement to a standstill and its life to an end. This force is the pressure of the sedentary civilizations round about; for although the Lord may have respect for Abel and his offering and not for Cain and his, no power can save Abel from being slain by Cain in revenge.¹

There is, indeed, a primordial antipathy and misunderstanding between the cultivator and the Nomad which has been observed in the life by a recent Western investigator in Manchuria:

'Within Manchuria, . . . while the Manchus have amalgamated themselves with the Chinese, there persists a profound cleavage between the Manchu-Chinese amalgamation and the still practically intact Mongol mass. What emerges from this is a realization of the profound power of culture—the way of life—in comparison with the factors of Race and Environment. . . . There is little difference, in physical racial type, between the majority of Northern Chinese and the majority of Mongols. . . . It is often possible to mistake a Chinese in Mongol costume for a Mongol, or a Mongol in Chinese costume for a Chinese. On the other hand, when it is possible to tell them apart, . . . it is only possible because of differences in stance, movement, expression, manner, which are intangible in the material sense but unmistakable. They are not differences of the physique itself, but of the life within the physical structure. Yet these intangibles, which belong to outlook, culture, feeling, and the way of life, establish a cleavage.'²

The causes of this social and moral cleavage can be laid bare by analysis, which makes it apparent that the relation between the cultivator and the Nomad is not unlike the relation between the landsman and the seaman.

'The Nomad moves in an annual orbit, and drives his herds each season over the ground on which he has pastured them at the same season the year before. His perpetual motion is not a symptom of waywardness and perversity. It is as scientific as the agriculturist's rotation of crops or performance of different operations in different fields at different times of year. Both are perpetually shifting the scene of their activities in order not to exhaust a particular parcel of ground. There is only a quantitative difference in the range of their oscillation, conditioned by the difference between their media of productivity. The Nomad, ranging widely in order to convert grasses into human food through chemical transformations in the bodies of tame animals, regards

¹ Gen. iv. 6–8.

² Lattimore, O.: *Manchuria Cradle of Conflict* (New York 1932, Macmillan), pp. 70–1 and 299–300.

the agriculturist as a stick-in-the-mud. The agriculturist, raising edible seeds and roots in sufficient quantities out of a much smaller area of land, regards the Nomad as a vagabond.

There would be nothing more in this than the commonplace mutual contempt of different trades, if the frontiers between Nomad's land and Peasant's land were stable. On his own ground, each of them is following that mode of life which the experience of generations has shown to be economically the most productive. He is in equilibrium with his environment and therefore more or less harmless and amiable. In fact, the Nomad who visits the Peasant or the Peasant who visits the Nomad at home is generally agreeably surprised at the courtesy of his reception.¹ . . . The traditional bitterness between Peasant and Nomad arises from a physical cause for which neither is to blame. Their respective environments and the frontiers between them are subject to periodic change.

Recent meteorological research indicates that there is a rhythmic alternation, possibly of world-wide incidence, between periods of relative desiccation and humidity,² which causes alternate intrusions of Peasants and Nomads into one another's spheres. When desiccation reaches a degree at which the Steppe can no longer provide pasture for the quantity of cattle with which the Nomads have stocked it, the herdsmen swerve from their beaten track of annual migration and invade the surrounding cultivated countries in search of food for their animals and themselves. On the other hand, when the climatic pendulum swings back and the next phase of humidity attains a point at which the Steppe becomes capable of bearing cultivated roots and cereals, the Peasant makes his

¹ The sedentary observer usually paints the Nomad in dark colours because he usually comes across him in a hostile relation: either as an aggressor to be anathematized or else as a victim of aggression who has to be given a bad name in order that the wrong which is being committed against him may be justified. (On this, see further the footnote on p. 18, below.) There are, however, a number of descriptions of the Nomad at home which, although they come from the hands of sedentary observers, are nevertheless surprisingly different from the usual picture of the 'Tartarean' Tartar or the hideous Hun; and since the authors of these descriptions are not only describing the Nomad in his native environment, but are themselves the children of several different sedentary civilizations and have written their accounts quite independently of one another, at wide intervals of space and time, there is a strong presumption that, in so far as these pictures of the Nomad agree with one another, they are likely to be more faithful portraits than the usual caricature.

The following references are offered as samples: Homer, *Iliad*, xiii, ll. 5-6: 'Those splendid horse-dairy-farmers the Abioi, who live on a milk diet and are the justest of Mankind'; Hippocrates: *De Aeribus, Aquis, et Locis*, ch. xviii; Herodotus, Bk. IV, ch. xlvi; de Rubruquis, Frater Willielmus: *Itinerarium Anno Gratiae 1253 ad Partes Orientales*, ch. iii; Marco Polo, ch. lii; Huc, l'Abbé: *Souvenirs d'un Voyage dans la Tartarie, le Thibet et la Chine pendant les années 1844, 1845, et 1846* (Paris 1850, Le Clere, 2 vols.); Atkinson, T. W.: *Oriental and Western Siberia: A Narrative of Seven Years' Explorations and Adventures in Siberia, Mongolia, the Kirgiz Steppes, Chinese Tartary and Part of Central Asia* (London 1858, Hurst and Blackett). The aforementioned works are all descriptive of the Nomads of the Eurasian Steppe. For their Afrikan fellow Nomads who range the North Arabian Steppe, see the Pentateuch, *passim*, and, among modern Western observers, above all Doughty, C. M.: *Travels in Arabia Deserta*, 2nd ed. (London 1931, Cape, 2 vols.) and the abridgement entitled *Wanderings in Arabia* (London 1908, Duckworth, 2 vols.). For the Afrikan Nomads who range the Sahara, see Rodd, F. R.: *The People of the Veil: The Wandering Tuareg Tribes* (London 1926, Macmillan).

² See Dr. Ellsworth Huntington's works, *passim*, but especially *The Pulse of Asia* (Boston and New York 1907, Houghton Mifflin) and *The Climatic Factor as illustrated in Arid America* (Washington, D.C., 1914, Carnegie Institution). In this 'Study of History', the phenomenon of climatic periodicity is discussed further in Part III. A, Annex II, below.

18 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS

counter-offensive upon the pastures of the Nomad. Their respective methods of aggression are very dissimilar. The Nomad's outbreak is as sudden as a cavalry charge, and shatters sedentary societies like the bursting of some high explosive. The Peasant's is an infantry advance. At each step he digs himself in with mattock or steam plough, and secures his communications by building roads or railways. The most striking recorded examples of Nomad explosion are the intrusions of the Turks and Mongols, which occurred in what was probably the last dry period but one. An imposing instance of Peasant encroachment is the subsequent eastward expansion of Russia. Both types of movement are abnormal, and each is extremely unpleasant for the party at whose expense it is made. But they are alike in being due to a single uncontrollable physical cause.¹

"The relentless pressure of the Cultivator is probably more painful in the long run, if one happens to be the victim of it, than the Nomad's savage onslaught. The Mongol raids were over in two or three generations; but the Russian colonization, which has been the reprisal for them, has been going on for more than four hundred years—first behind the Cossack lines, which encircled and narrowed down the pasture-lands from the north, and then along the Transcaspian Railway, which stretched its tentacles round their southern border. From the Nomad's point of view, a Peasant Power like Russia resembles those rolling and crushing machines with which Western Industrialism shapes hot steel according to its pleasure. In its grip, the Nomad is either crushed out of existence or racked into the sedentary mould, and the process of penetration is not always peaceful. The path was cleared for the Transcaspian Railway by the slaughter of Türkmens at Göktepé.² But the Nomad's death-cry is seldom heard. During the European War, while people in England were raking up the Ottoman Turks' Nomadic ancestry in order to account for their murder of 600,000 Armenians, 500,000 Turkish-speaking Central Asian Nomads of the Kirghiz Qāzāq Confederacy were being exterminated—also under superior orders—by that "justest of mankind" the Russian muzhik. Men, women, and children were shot down, or were put to death in a more horrible way by being robbed of their animals and equipment and then being driven forth in

¹ 'It is as erroneous to attribute [the] workings [of this physical cause] to human wickedness in the one case as in the other. Yet while the intrusive Nomad has been stigmatized as an ogre, the intrusive Peasant has either escaped observation or has been commended as an apostle of civilization. The reasons for this partiality are clear. One is that the Nomad's tactics are more dramatic than the Peasant's and make a correspondingly greater impression on the imagination. The other is that history is written for and by the sedentary populations, which are much the most numerous and sophisticated portion of Mankind, while the Nomad usually suffers and pines away and disappears without telling his tale. Yet, if he did put it on record, he might paint us as monsters.' One of the oldest and most famous of the extant literary presentations of this secular conflict is, in fact, written from the Nomad's standpoint; and here, in the fourth chapter of the Book of Genesis, our own prototype Cain—the first tiller of the ground and the first builder of a city—is branded for all time with the mark of his blood-guiltiness for the slaying of his pastoral brother. But if Abel's advocate has had the first word, Cain's advocates have held the floor ever after. In the Iranian epic of the struggle between Iran and Turan, the sympathy has already been transferred to Cain's side. This revised version of the story has prevailed down to this day. And it is usually the last word that carries weight in the minds of the jury.

² In 1881,

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 19
winter-time to perish in mountain or desert. A lucky few escaped across the Chinese frontier.¹ These atrocities were courageously exposed and denounced by Mr. Kerensky in the Duma before the first Russian Revolution; but who listened or cared? Not the Czar's Government, nor the great public in the West.²

The epitaph of Nomadism has been written, in a famous work of literature, by a son of the sedentary civilization which has given the Nomad the *coup de grâce*.³ In Eurasia, Nomadism was doomed from that moment in the seventeenth century of the Christian Era when two sedentary empires, the Muscovite and the Manchu, stretched their tentacles round the Eurasian Steppe from opposite quarters until they interlaced with one another. From that moment onwards, it was merely a question of how long it would take for this living noose to strangle the Eurasian Nomad who was caught fast in its toils. In the Manchu Empire, a horde of non-Nomadic barbarian conquerors were serving the purposes of the Far Eastern Society, whose domain they had overrun and whose culture they had adopted, by helping to extirpate, on the adjoining steppe-land, the alien Nomadic way of life.⁴ In the Muscovite Empire, a first infusion of Western Civilization was inspiring an Orthodox-Christian body politic with fresh energy and arming it with newfangled weapons. In our own 'post-war' generation, our Western Civilization, which has now spread its tentacles over the entire surface of the planet, is completing the extirpation of Nomadism not only in Eurasia, but in all its other ancient domains.

In the Eurasian domain, the powerful solvent of Russian Communism is now being applied to disintegrate the Nomadic way of life over a vast range of territories stretching from Transcaspia to Outer Mongolia, while in Inner Mongolia and Manchuria the last of the Nomad conquerors of China have been almost extinguished on their own ancestral pasture lands by the peaceful penetration of the conquered Chinese peasantry.⁵ In Kenya, the pasture-lands of

¹ For details see Czaplicka, M. A.: *The Turks of Central Asia in History and at the Present Day* (Oxford 1918, Clarendon Press), p. 17. The respective estimates of the total numbers of murdered Qazāqs and Armenians are both conjectural.

⁵ See Toynbee, A. J.: *Survey of International Affairs: 1920-3*, p. 433; 1925, vol. ii, pp. 350-1; 1928, pp. 434-5. See further an article by Young, C. W., in *Current History*, New York, July 1928. In *Manchuria Cradle of Conflict* (New York 1932, Macmillan), on pp. 125-32, Mr. Owen Lattimore describes in detail the process by which the Mongol Nomad is being replaced by the Chinese peasant in Inner Mongolia and Manchuria. For the contrast between the antipathy of the Mongol and the sympathy of the Manchu towards the Far Eastern culture, see further op. cit., pp. 73-4 and 131-2.

the Masai have been cut up and cut down to make room for intrusive European farmers who aspire to sow and reap on the Equator. In the Sahara, the Imoshagh are seeing their hitherto impenetrable desert fastnesses invaded by the aeroplane and by the eight-wheeled automobile. In Libya, where the Afrasian Nomadism has been organized to resist the European onset by the Islamic religious order of the Sanūsiyah, the resistance collapsed when, in January 1931, a column of Italian troops occupied the Sanūsī fastness in the reputedly impregnable oasis of Kufarā. Even in Arabia—the classic home of the Afrasian Nomadism and the most impervious of all the continents to penetration by Western pioneers—the Badu are being forcibly converted, in this age, into fallāhīn, and this by no alien Power, but by the deliberate policy of an Arab of Arabs, ‘Abd-al-‘Azīz Āl-Sa‘ūd, the King of the Najd and the Hijāz, and the temporal head of the Wāhhābī community of puritanical Muslim zealots.¹ When a Wāhhābī potentate in the heart of Arabia is fortifying his political authority with the weapon of armoured cars and solving his economic problems by means of petrol pumps and artesian wells, it is evident that the spirit of the Western Civilization is prevailing in the Nomadic Civilization’s innermost citadel, and that the last hour of Nomadism has struck.

Thus Abel has been slain by Cain; and, of all the sedentary civilizations which the Nomadic Civilization has encountered in the course of some five thousand years of contact between these two varieties of the same social species, it is our own Western Civilization that has consummated the fratricidal act. This Western Civilization has swept Nomadism off the face of the Earth, almost without noticing what it has been doing, as one incident in the titanic social revolution by which, within the last hundred and fifty years, all the habitable lands and navigable seas on the face of the planet, and the entire living generation of Mankind, have been linked together, by a Western-made mechanism, into a single world-wide economic order. Western enterprise has built up this new world order by burying its own fields under mushroom cities and putting the virgin grasslands of all the continents under the plough in order to feed these mushroom cities’ pullulating industrial populations. In this oecumenical society, with its dynamic economy, there is no place for the arrested civilization and the static economy of the Nomadic

¹ For Ibn Sa‘ūd’s policy of converting the tribesmen of Central Arabia from Nomadism to agriculture on a large scale by planting them in organized settlements, and for his triumph over the recalcitrants, see Toynbee, A. J.: *Survey of International Affairs: 1925*, vol. i, p. 281; 1928, p. 290; 1930, pp. 177–82. For details of Ibn Sa‘ūd’s agricultural settlements (*hijrahs*), see Philby, H. St. J. B.: *The Heart of Arabia* (London 1922, Constable), vol. i, pp. 299–300; Amīn-ar-Rihānī: *Tarikh Najd al-Hadīth* (Cairo 1928), pp. 412–14, and *Ibn Sa‘ūd of Arabia* (London 1928, Constable), pp. 191–9; Philby, H. St. J. B.: *Arabia* (London 1930, Benn), pp. 225 seqq.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 21
horde revolving perpetually round its closed annual cycle.¹ Abel is indubitably dead, and we are left to inquire whether the curse of Cain is duly descending upon his slayer.

'And now art thou cursed from the Earth, which hath opened her mouth to receive thy brother's blood from thy hand; when thou tillest the ground, it shall not henceforth yield unto thee her strength; a fugitive and a vagabond shalt thou be in the Earth.'²

This first clause of Cain's curse has manifestly proved ineffective; for though the oasis-cultivator has certainly found himself unable to raise crops from the desiccated steppe-land, his migrations have carried him, several thousand years ago, into regions round about in which the climatic conditions have not proved insuperably adverse; and thence, in the fullness of time, he has returned, as we have seen, with the new driving force of Industrialism behind him, to claim the grasslands for the plough and to make the desert blossom³ by the latter-day arts of artesian-boring and dry-farming. It is rather in building the city from which these new arts and this new driving-power derive that Cain has given hostages to Fortune. The emergence of Industrialism and the extinction of Nomadism are two outstanding events in the history of the last 150 years; and, as we have seen, these two events are not merely contemporary but

¹ The impossibility of finding a place for Nomadism in the economy of an industrialized world is proved not only by the recent revolution on the grasslands of the Old World, from which an old-established Nomadism has been evicted by the Russian and the Chinese peasant's plough. It is demonstrated still more cogently by what has happened on the grasslands of South and North America, where the pioneers of European colonization found only hunting peoples in previous occupation. (See II. C (ii) (a) 2, vol. i, p. 255, above.) The immediate effect of the European pioneers' advent was to turn these former hunting-grounds not into fields and cities but into cattle-ranches; but the 'cow-boys' have been more ephemeral than the 'Indians' whom they have exterminated. They have been merely the foam frothing on the crest of the oncoming wave; and, within less than two generations, they have been supplanted in their turn by the ploughman and the mechanic, who all the time were following hard at their heels in irresistible force. To-day, the Middle Western prairies are being covered by a network of fields and cities, no less than the Central Asian Steppes. Yet our urban imaginations have been rightly captivated (see II. C (ii) (a) 2, vol. i, p. 255, above) by the 'cow-boy's' wild ride across our prosaic social stage. For his brief appearance has been a repetition—performed in the full light of history—of the evolution (sketched above) through which the Nomads of the Old World were begotten by earlier sedentary societies. The latter-day Nomadism which has been begotten in the New World by our Western Society has, it is true, been abortive. But let us imagine, for a moment, that, after the occupation of the prairies by the 'cow-boys' in the middle of the nineteenth century, these grasslands had been rendered unfit for the production of cereals (even by 'dry farming') through an access of aridity; or let us imagine that plantation-slavery or civil war or some other social disaster had blighted, in North America, the growth of the sedentary civilization from whose bosom the 'cow-boys' had emerged: then, in either of these eventualities, we can readily picture the 'cow-boys' making the prairies their own not merely for two brief generations, but perhaps for centuries or even for thousands of years. In that event, the history of Nomadism in the Old World would have repeated itself in the New. For this abortive Nomadism of the North American Prairies, see French, the Hon. W.: *Some Recollections of a Western Ranchman, New Mexico, 1883-1899* (London 1927, Macmillan); James, W.: *Lone Cowboy: My Life Story* (London 1930, Scribners); Love, C. M.: 'The History of the Cattle Industry in the South West' (in *The South-Western Quarterly*, vol. xix); Paxson, F. L.: 'The Cow Country' (in *The American Historical Review*, vol. xxii); Rollins, P. A.: *The Cowboy* (New York and London 1922, Scribners).

³ Isaiah xxxv. 1-2.

22 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
are also interconnected. In this year 1935, when the new economic world order is threatened with break-down and dissolution, it seems not impossible that Abel may be avenged, after all, upon his fratricide brother; and that *Homo Nomas*, *in articulo mortis*, may yet linger on to see his slayer, *Homo Faber*, go down, distraught, to Sheol.

The 'Osmanlis

So much for the civilizations that have suffered arrest as a penalty for a *tour de force* in response to some physical challenge. In order to complete our survey, we must now consider the two parallel cases—the predicament of the 'Osmanlis and the predicament of the Spartans—in which the superlative challenge that has evoked the *tour de force* has been not physical but human.

The superlative challenge to which the Ottoman system was a response was the geographical transference of a Nomadic community from its native environment on the Steppe, where it had been at grips with Physical Nature, to an alien environment in which it found itself free from the physical pressure of desiccation but was confronted, in exchange, with the novel problem of exercising dominion over alien communities of human beings. We have already taken note¹ of these occasional aberrations of Nomad hordes out of their regular annual orbits on the Steppe into the domains of neighbouring sedentary civilizations in mechanical obedience to physical pushes or to human pulls. We have also had occasion to observe incidentally, apropos of a particular instance of this phenomenon, the first reaction which this new challenge is apt to evoke. We have seen how the Avar Nomads, when they found themselves expatriated from their cattle-ranges on the Steppe and stranded, *in partibus agricolarum*, in the derelict provinces of the Roman Empire in the sixth century of the Christian Era, sought to deal with the sedentary population which they had conquered as though it were a human flock, and attempted to transform themselves from shepherds of sheep into shepherds of men.²

This Avar experiment has been tried by other *ci-devant* Nomads who have found themselves from time to time in similar situations, and it is indeed a logical application of an obvious analogy. In their native environment on the Steppe, the Nomads live off the local vegetation at second hand by subjecting it to a preliminary transformation through the agency of certain fellow members of the Animal Kingdom whom the Nomads have at their command. In the alien environment of fields and cities, an intrusive horde of *ci-devant* Nomads almost inevitably expects to make its living in an

¹ On p. 15, above.

² II. D (vii), vol. ii, pp. 317-19, above.

analogous way. Instead of living off the wild herbage of the Steppe through the transforming medium of tame animals, the *émigrés* now propose to live off the cultivated crops of the ploughland and the manufactured goods of the workshop and the profits of the counting-house through the transforming medium of subject human beings: a servile peasantry and a servile bourgeoisie. The analogy is tempting to apply, and it works out in practice up to a point; but the empirical test discovers in it one almost fatal flaw.

On the Steppe, the composite society constituted by the Nomads and their non-human cattle is the most effective social instrument of economic utilization which can be devised for dealing with that kind of physical environment at that degree of aridity. While the Nomad would not, of course, be able to keep alive on the Steppe at all without his flocks and herds, he is not a parasite upon his non-human partners in the pastoral business, since it would be just as impossible for these sheep and cattle and dogs and horses and camels to keep alive on the Steppe, in anything like their actual numbers, under the actual climatic conditions, without the assistance of their human overseers. At this degree of aridity, neither the human nor the non-human denizens of the Steppe could continue to live there in any considerable numbers except in association with one another,¹ and *a fortiori* they could not survive there in the anti-social relation of hunter and hunted, in which their predecessors once stood to one another in the Pluvial Age, before the challenge of desiccation was presented to both alike. On the other hand, in an environment of fields and cities, a composite society constituted of expatriated Nomads and indigenous 'human cattle' is economically unsound; since in these alien circumstances the 'shepherds of men' are always economically—though not always politically—superfluous and therefore parasitic. From the economic

¹ In this connexion it is significant that the one-humped Camel of the Afrasian Steppe is one of the rare species of animals that are now represented only by domesticated breeds, without any wild specimens having survived. Mr. G. F. Hudson points out, however, that wild specimens of the Eurasian two-humped camel (i.e. the Mongolian Wild Camel) are still to be found in Tsaidam and round the Lob Nor; and that specimens of the Afrasian one-humped camel which had reverted to a wild state were to be found—at any rate until the close of the nineteenth century of the Christian Era—in the arid fens of the Guadalquivir in Spain. (These were the descendants of camels which had been brought in from Africa, after the Muslim conquest of the Iberian Peninsula, by the Arabs and Moors.) Moreover, there are not only wild camels but wild horses and wild asses still extant in Mongolia and in the Tarim Basin. An account of these rare animals will be found (as Mr. Hudson has brought to the attention of the writer of this Study) in Sir Henry Howorth: *A History of the Mongols*, vol. iv (London 1928, Longmans), pp. 19-23. Apropos of Mongolia, Howorth observes that 'the most interesting district in many ways in regard to its fauna is the most barren and unattractive wild part, where the absence of water and fodder make it practically uninhabitable by Man. . . . This kind of country is chiefly found in Alashan and the Steppes of the Ordus and in the land about Lob Nor and parts of Dzungaria.' This is evidently the limiting case; but for the major part of the Steppe, which lies climatically between the extreme of aridity and the degree of humidity that is required for cultivation, the thesis put forward here in this Study probably holds good.

24 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
standpoint they have ceased to be shepherds keeping their flocks and have turned into drones exploiting the worker-bees. They have become a non-productive ruling-class maintained by the labour of a productive subject-population which receives from them no economic contribution in exchange for an uneconomic tax, and which could therefore utilize its fields and cities to much better economic effect if this human incubus were absent.

For this reason, the empires established by Nomad conquerors of sedentary populations have usually suffered the fate of the seeds in the parable which 'fell upon stony places where they had not much earth; and forthwith they sprung up, because they had no deepness of earth; and when the Sun was up they were scorched; and because they had no root they withered away'.¹ The usual career of such empires is to begin with an imposing display of power, but to belie their first promise by a rapid decadence and a premature extinction. The great Maghribī historian Ibn Khaldūn (*vivebat* A.D. 1332-1406) was thinking in terms of Nomad empires—the prevalent type of empires in Ibn Khaldūn's time and place—when he assessed the average duration of empires in general at not more than three generations or 120 years.² Nomad empires are apt to be powerful at the outset because the moral virtues of self-control and endurance and the intellectual aptitudes for forethought and organization, which are developed in the Nomad by his proper profession of pasturing his flocks and herds on the Steppe, are also potent for the military conquest of sedentary human populations. At the same time, these Nomad empires are apt to be ephemeral because the special qualities of the Nomad, being the outcome of his response to the challenge of his native environment, inevitably tend to atrophy in a new environment which fails to provide the requisite stimulus. Thus Nomad empire-builders usually degenerate, while on the other hand their sedentary subjects, after having been first stunned by the shock of the conquest (which is often a brutal business) and having then been hypnotized into acquiescing in the unnatural status of 'human cattle', usually begin to recover their *moral* at about the time when their *ci-devant* Nomad masters begin to lose theirs—and this for the inverse reason. If the ex-Nomad 'shepherd of men' degenerates because he has passed out of his own element and has become economically superfluous, his 'human cattle' recuperate because they have remained on their own

¹ Matt. xiii. 5-6.

² Ibn Khaldūn: *Muqaddamāt*: French translation by de Slane, Baron McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. i, pp. 342-59, especially p. 347. Compare the passage in the same volume, p. 286, in which the author lays down that nobility lasts for four generations on the average and that corruption is of the essence of the Universe. (These passages from Ibn Khaldūn have been cited already in the present Study in vol. ii, on p. 212, above.)

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 25
ground and have not ceased to be economically productive—even under the adverse social conditions of political subjection.

In these circumstances, the false social analogy breaks down, and the 'human cattle' reassert their manhood by either expelling their shepherd-kings or assimilating them. The dominion of the Avars over the Slavs lasted, in all probability, for less than fifty years;¹ and while the transitory Avar ascendancy was the making of the Slavs, the enslavement of the Slavs proved to be the undoing of the Avars. While the Slavs proceeded to make their mark on both Orthodox Christian and Western history, the Avars simply lingered on, in the outlying Hungarian enclave of the Eurasian Steppe, until they were exterminated, after the lapse of two centuries, by Charlemagne. Some Nomad empires have had still shorter lives than this. For example, the empire of the Western Huns, who passed out of Eurasia into the Hungarian Alföld about a century and a half before the Avars, lasted no longer than the life-span of a single individual: Attila.² The empire of the Mongol Il-Khans over Iran and 'Irāq lasted less than eighty years (*circa* A.D. 1258–1335),³ and the empire of the Great Khans themselves over Southern China had an equally short duration (*circa* A.D. 1280–1354).⁴ The empires of the Chaghatāy Mongols over Transoxania⁵ and of the Hyksos over Egypt⁶ each lasted a bare century. The Magyars, who were the next Nomad occupants of the Hungarian Alföld after the Avars, were absorbed, by conversion, into the body social of Western Christendom within little more than a hundred years after their arrival. The span of more than two centuries (*circa* A.D. 1142–1368) during which the Mongols and their immediate local predecessors the Kin ruled continuously over Northern China,⁷ and the longer span of over three centuries and a half (*circa* 140 B.C.–A.D. 226/232) during which the Parthians were masters of 'Irāq as well as Iran, were distinctly exceptional.⁸

¹ See Peisker, T.: *The Expansion of the Slavs* (= *The Cambridge Medieval History*, vol. ii (Cambridge 1912, University Press), ch. xiv), cited already in II. D (vii), vol. ii, p. 318, above.

² Similarly, the dominion of the Eastern Huns (the White Huns or Ephthalites) was limited to the life-span of a single individual, Mihiragula, in India. In the Oxus-Jaxartes Basin, on the other hand, the Ephthalites succeeded in maintaining their ascendancy for a period—extending from the early part of the fifth century of the Christian Era to A.D. 567—which approximated to Ibn Khaldūn's figure of 120 years.

⁵ See vol. ii, pp. 144–6, above.

⁶ See vol. i, pp. 104–5, 137–9, and 144, and vol. ii, pp. 113, footnote 3, and 388–91, above.

⁷ See vol. ii, p. 121, above.

⁸ The average period of the ascendancies which have been exercised from time to time over a sedentary population in the Russian forest-belt by Nomads in occupation of the western arm of the Eurasian Steppe, which skirts the north coast of the Black Sea, appears to have been decidedly longer than Ibn Khaldūn's average of 120 years. The Scythians held their 'human cattle' in subjection (Herodotus, Bk. IV, ch. 3), and extracted from them a surplus of cereals for export to the Aegean, throughout the fifth and fourth centuries B.C. The Khazars drew tribute from the Russian Slavs from the

By these standards of comparison, the duration of the Ottoman Empire over the Orthodox Christian World was unique. If we date its definitive establishment from the Ottoman conquest of Macedonia in A.D. 1371-2, and the beginning of its end from the peace-treaty of Küchük Qaynarjy, which terminated the most disastrous of the Russo-Turkish Wars in A.D. 1774, we shall be assigning to the zenith of the Ottoman régime a period of fully four centuries without reckoning in the time which it took, before that, to rise and, after that, to fall. What is the explanation of this relative durability of the Ottoman Nomad empire-builders' work?

A partial explanation is, no doubt, to be found in the course of Orthodox Christian history, in which the Ottoman régime was an episode. For although on the economic plane the 'Osmanlis were not less parasitic than any other *ci-devant* Nomads who had been carried by conquest on to a sedentary society's ground, they were fortunate in finding on the political plane an unusually positive and constructive function to fulfil. Ejected from the Eurasian Steppe by the explosion of the Mongols (a social convulsion produced by one of the periodical turns of the Eurasian climatic screw), the fathers of the 'Osmanlis were driven deep into the Orthodox Christian World, and were lodged there by chance in a position of exceptional strategic advantage,¹ at a turning-point in Orthodox Christian history. This little band of Eurasian Nomad refugees happened to arrive at the north-western edge of the Anatolian Plateau, overlooking the Sea of Marmara, just after the Orthodox Christian 'Time of Troubles' had reached and passed its nadir. The break-down of the Orthodox Christian Civilization may be dated by its most prominent outward symptom: the Great Bulgaro-Roman War of A.D. 977-1019.² The landmarks in the subsequent disintegration of Orthodox Christendom were the military *débâcle* of the East Roman Power at Manzikert in A.D. 1071, which left the interior of Anatolia at the mercy of the Saljûqs; the successful insurrection of the Bulgars against the East Roman domination in A.D. 1186; and—crowning catastrophe—the capture and sack of

latter part of the sixth century of the Christian Era until the Norsemen filched their Slav tributaries from them in the ninth century. The Mongols of Qipchâq exercised dominion over Russia, off and on, from the first half of the thirteenth century of the Christian Era until the latter half of the fifteenth. This longer Russian average, however, may be regarded as the exception which proves Ibn Khaldûn's rule, for the relations between the sedentary peoples in Russia and their Nomad overlords on the Black Sea Steppe were not quite of the usual kind. The Nomads did not here transfer their own habitat from the Steppe to the forest. They remained on the Steppe—on their own ground—and exercised their suzerainty over the forest-dwellers from a distance.

¹ For the settlement of Ertoghrlu and his fellow refugees in Sultan Özü in the latter part of the thirteenth century of the Christian Era, see II. D (v), vol. ii, pp. 150-3, above.

² For the cause of this destructive internecine warfare in the Orthodox Christian World, see II. D (vii), vol. ii, pp. 368-9, above, and Part IV, below.

the East Roman capital, Constantinople, itself in A.D. 1204 by the Western military and commercial adventurers who were seeking their fortunes on the so-called Fourth Crusade. The tide turned when an Anatolian Greek successor-state of the East Roman Empire, the Principality of Nicaea—starting from a base of operations at the foot of that very section of the plateau-rim on which the fathers of the 'Osmanlis were in the act of pitching their tents—actually anticipated, and conceivably inspired, the subsequent exploits of the 'Osmanlis themselves by crossing the Dardanelles, conquering Adrianople, and enveloping Constantinople on the landward side in A.D. 1235, annexing Macedonia in A.D. 1246, and finally recapturing the Imperial City from the Western usurpers in A.D. 1261. To play the historic role of being the empire-builders of an Orthodox Christian universal state was not the Nicene Greeks' destiny. Yet their passage of the Dardanelles in A.D. 1235 marked a transition, in the Orthodox Christian 'Time of Troubles', from the process of disintegration to a process of reconstruction; and the work of consolidation and pacification, which these Nicene Greeks had initiated and which was the crying need of the Orthodox Christian Society in that age, was duly accomplished in the fullness of time by the 'Osmanlis. Treading on their Nicene forerunners' heels, the 'Osmanlis made their passage of the Dardanelles in A.D. 1355 and their conquest of Adrianople in 1360 and their conquest of Macedonia in 1371-2; and they crowned their construction of a universal state, embracing the whole of the main body of Orthodox Christendom, by their capture of Constantinople in A.D. 1453.

It will be seen that the *Pax Ottomanica* fulfilled a long-unsatisfied and urgent requirement of the Orthodox Christian Society; and this partly explains the duration of an empire which was able to perform for its subjects this vitally important service. Yet this explanation is incomplete; for, from the Orthodox Christian standpoint, the Ottoman Empire was always an alien and an odious Power whose heavy yoke was only worn under sheer compulsion and whose genuine social services were recognized grudgingly, if at all. Moreover, this Ottoman Power was not exempt from the economic weakness, analysed above,¹ which is inherent in all Nomad dominions over sedentary populations. The relative durability of the Ottoman Empire, by comparison with other Nomad dominions of the same general type, only becomes fully intelligible when we view it in the light of the special Ottoman adaptation of the common Nomad institutions in response to an extraordinary challenge.²

¹ See pp. 23-5, above.

² For the stimulus which was administered to the 'Osmanlis by the challenge of Orthodox Christendom, see II. D (v), vol. ii, pp. 150-4, above, where the history of the 'Osmanlis is contrasted with that of the Qaramanlis.

We have seen that the Avars and their like, when they have trespassed from the Desert on to the Sown, have attempted—and failed—to deal with their new situation by turning themselves from shepherds of sheep into shepherds of men. Their failure seems the less surprising when we consider that these unsuccessful Nomad empire-builders in *partibus agrorum* have not attempted to find any sedentary human equivalent for one of the essential partners in the composite society of the Steppe. For this Steppe Society does not consist simply of the human shepherd and his flock. In addition to the domesticated animals which he keeps alive in order to live off their products, the Nomad keeps other animals—the dog, the camel, the horse—whose function is not to provide him, as his sheep and cattle provide him, with food and clothing, but to assist him, as non-human auxiliaries, in his pastoral task.¹ These auxiliary animals are the *chef d'œuvre* of the Nomadic Civilization and the key to its success. Without their aid, the Nomad's *tour de force* would pass the bounds of human capacity; yet this aid can only be enlisted by a miracle of human ingenuity. The sheep or the cow has merely to be tamed (though that is difficult enough) in order to be of service to Man. The dog and camel and horse cannot perform their more sophisticated services until they have been tamed and trained into the bargain. The training of his non-human auxiliaries is the Nomad's crowning achievement; and it is the adaptation of this higher Nomad art to sedentary conditions, over and above the adaptation of the comparatively commonplace art of taming sheep and cattle, that distinguishes the Ottoman Empire from the Avar Empire and accounts for its vastly greater strength and durability. The Ottoman Pādishāhs maintained their empire by training slaves as human auxiliaries to assist them in keeping order among their 'human cattle'.

This remarkable institution of making soldiers and administrators out of slaves—an idea which is so congenial to the Nomad genius and so alien from ours—was not an Ottoman invention. We find it in other Nomad empires over sedentary peoples—and this precisely in those which have had the longest duration next to the Ottoman Empire itself.

We catch glimpses of military slavery in the Parthian Empire in the last century B.C. One of the Parthian armies that frustrated

¹ The division between these two categories of animals is not, of course, completely clear-cut. The horse, for example, belongs to both classes, since it provides its Nomad master with milk and meat, besides providing him with a mount of greater mobility than the cattle which the Nomad herdsman has to round up. The primary animal in the auxiliary class appears to be the dog, who was also perhaps the first animal ever to be domesticated by Man. The transformation of the hound into the sheep-dog must have been accomplished through the middle term of the watch-dog; and this must have happened during the agricultural stage which intervened between hunting and Nomadism. (See p. 10, above.)

Mark Antony's ambition to emulate Alexander the Great was reported to have borne only 400 free men on its strength out of a total of 50,000 effectives;¹ and the Surēn who commanded the earlier Parthian army which annihilated the Roman army of Crassus was reported to have brought into the field no less than 10,000 slaves and clients of his own.² In the same region a thousand years later, the 'Abbasid Caliphs maintained—and forfeited—their authority in the ninth and tenth centuries of the Christian Era by purchasing Turkish slaves off the Eurasian Steppe and training them at Baghdad for the calling of soldiers and administrators.³ This 'Abbasid institution was adopted, and perhaps elaborated, in the principality of the Sāmānidae (*regnabant* A.D. 819–999),⁴ which was the successor-state of the 'Abbasid Caliphate on its north-eastern marches, over against the Eurasian Steppe. These Sāmānid princes, who ruled at Balkh and Bokhārā, were closer than the Caliphs at Baghdad to the source from which the raw material for a Turkish slave-staff was derived, and at the same time they had a proportionately stronger incentive to train a pack of 'human watch-dogs' in order to protect their perilously exposed dominions from the depredations of their domesticated Turks' wild kinsmen. The Sāmānids' Turkish slaves were put through a long and minutely graduated probation which, for individuals who showed merit, became a *cursus honorum* culminating in an appointment to some responsible administrative office at, but not before, the age of thirty-five.⁵ This Turkish slave household was a factor both in the long preservation of the Sāmānid régime and in its ultimate extinction; for, while the greater part of the Sāmānid dominions was eventually overrun by the wild Turkish Nomads from the Steppe—the Saljūq Khān's horde on the left bank of the Oxus and the Ilék Khān's horde on the right bank—the House of Sāmān itself actually

² Plutarch: *Life of Crassus*, ch. xxi.

³ The 'Abbasids' Turkish bodyguard at Baghdad had its counterpart, at the court of the 'Abbasids' Umayyad contemporaries and rivals at Cordova, in a bodyguard of European barbarians who were purchased by the Spanish Caliphs from their Frankish neighbours. The Franks supplied the Cordovan slave-markets by making slave-raids across the opposite frontier of the Frankish dominions. The barbarians who were thus captured by the Franks in order to be sold to the Spanish Umayyads happened to be Slavs; and this is the origin of the word 'slave' in the English language.

⁴ See II. D (v), vol. ii, p. 142, above.

⁵ The Sāmānids' slave-system is sketched by the Nizām-al-Mulk Abu 'Alī Hasan in the 'Siasset Namēh' = Siyāset-Nāmeḥ (French translation by Schéfer, Ch. (Paris 1893, Leroux), p. 139, cited by Lybyer, A. H.: *The Government of the Ottoman Empire in the Time of Suleiman the Magnificent* (Cambridge, Mass. 1913, Harvard University Press), pp. 22–3. Sāmānid institutions are a subject on which the Nizām-al-Mulk may be accepted as an authority, since he was himself an administrator in the service of the Saljūqs: the Turkish intruders from the Eurasian Steppe who were the Sāmānids' successors in Khurāsān. Moreover, the Nizām-al-Mulk and the House of Sāmān had a common cultural background as fellow Iranians and as joint heirs of the Syriac Civilization.

30 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
received its *coup de grâce* from one of its own slave administrators:
Sebuktegin.¹

In the interregnum which followed the extinction of the successor-states of the 'Abbasid Caliphate, we find slave-soldiers and slave-administrators not only repeating Sebuktegin's individual exploit of supplanting the dynasties in whose service they had been trained, but actually replacing these by slave-dynasties, in which the dominion passed from slave to slave instead of passing from father to son. In the thirteenth century of the Christian Era, the new domain in Hindustan which had been conquered for the nascent Iranic Civilization by a series of Turkish soldiers of fortune, beginning with Sebuktegin, was ruled from Delhi by a sequence of 'Slave-Kings' (*regnabant* A.D. 1206-87). A more celebrated instance of the same remarkable phenomenon was the Mamlūk régime in Egypt. These Egyptian Mamlūks, as their name implies,² were originally the slaves of others. Their makers and masters were Saladin and the heirs of his body, the dynasty of the Ayyūbidae; but in A.D. 1250, at a critical moment in the life-and-death struggle of the nascent Arabic Civilization against the Crusaders, the Ayyūbids' Mamlūks brushed the Ayyūbids themselves aside and took the Ayyūbid slave-system over on their own account as their own slaves and own masters—perpetuating themselves, as before, by the purchase of fresh relays of slaves from abroad,³ without resuming the normal human method of procreation.

Behind the façade of a puppet Caliphate—invested in a line of latter-day 'Abbasids, to whom the Mamlūks gave asylum in Cairo after the Mongol sack of Baghdad, on the understanding that these august refugees should reign but should not govern⁴—the self-owned slave-household of the extinct Ayyūbids ruled Egypt and Syria, and held the redoubtable Mongols in check at the line of the Euphrates, from A.D. 1250 to A.D. 1516-17, when they met more than their match in the slave-household of the 'Osmanlis. Yet the Ottoman conquest was not the end of the Mamlūks; for although the strong slave armed had been overcome by a stronger than he, and had been constrained to submit to a division of his spoils,⁵ the

¹ For details see Barthold, W.: *Turkestan down to the Mongol Invasion*, 2nd ed., translated into English and revised by the author with the assistance of H. A. R. Gibb (London 1928, Luzac), pp. 261-4.

² Mamlūk is the past participle passive of the Arabic verb *malaka*, which denotes the ownership of property.

³ The Egyptian Mamlūks made sure of their source of supply by maintaining a political entente with the Mongol khanate of Qipchāq and with the maritime power of Venice. The Khans of Qipchāq made slave raids upon the Caucasian highlanders and the Russian forest-dwellers and the Eurasian Nomads beyond the pale of the Khan's own horde. The Venetians were the middlemen who conveyed the newly captured slaves from Tana to Damietta. This slave-trade was one of the most lucrative lines of Venetian business.

⁴ For these Cairene 'Abbasidae, see I. C (i) (b), vol. i, p. 67, footnote 2, and pp. 70-1, above, and Part X, below.

⁵ Luke xi. 21-2.

'Osmanli forbore to take from the Mamlūk the armour wherein he trusted. Under the Ottoman régime in Egypt, the Mamlūk corps was permitted to perpetuate itself, as before, by the same method of training and from the same sources of recruitment; and, as the Ottoman power declined, the Mamlūk power reasserted itself. In the eighteenth century of the Christian Era, the Ottoman Pasha of Egypt came to be virtually a state prisoner of the Mamlūks; and he reigned as the Pādishāh's viceroy without having much more share in the government of Egypt than the Cairene 'Abbasids had been allowed in their day. At the turn of the eighteenth and nineteenth centuries, it seemed an open question whether the Ottoman heritage in Egypt would revert to the Mamlūks or fall to some Western Power; and although both these alternatives were overruled, in the event, by the genius of Mehmed 'Alī, this great Ottoman statesman had more ado to settle accounts with the Mamlūks than to keep the British at arm's length or to step into the shoes of the French. It needed all Mehmed 'Alī's ability and energy and ruthlessness to exterminate this self-perpetuating slave-corps after it had kept itself alive on the alien soil of Egypt, by constant drafts of Eurasian and Caucasian man-power, for more than five hundred years; and even then the Mamlūks died hard. The last stand which was made, after the massacre of A.D. 1811, by a handful of survivors in the unexplored African hinterland of Egypt on the Upper Nile, was not the least impressive demonstration of the singular vitality which this extraordinary institution displayed from the beginning to the end.

In discipline and organization, however, the Mamlūk slave-household which had supplanted the Ayyūbid Dynasty in the dominion over Egypt, was far surpassed by the somewhat younger slave-household which the Ottoman Dynasty created as an instrument for the establishment and maintenance of its dominion over the Orthodox Christian World. To exercise dominion over the entire body social of an alien civilization was evidently the hardest task which a Nomad conqueror could set himself; and this audacious enterprise called out, in 'Osmān and his successors down to Suleymān the Magnificent, a supreme display of the Nomad's social capacities. The Ottoman slave-household is the finest recorded specimen of the species and on that account the most illuminating example for our purpose.¹

¹ The universal state which was imposed upon the Orthodox Christian World by the 'Osmanlis has, of course, its historical counterpart in the universal state which was imposed upon the Hindu World, some two centuries later, by the Timurid 'Mughals' who, like the 'Osmanlis, were Turks of Nomadic antecedents with a veneer of Iranic culture; but here an equivalent challenge evoked no more than the rudiments of an equivalent response. We have seen that the Egyptian Mamlūks had their counterparts, in the thirteenth century of the Christian Era, in the Delhi 'Slave-Kings'; and in the following century certain contemporaries, in Hindustan, of the early Ottoman empire-builders

Its general character is conveyed in the following passage from a brilliant study by an American scholar:¹

'The Ottoman Ruling Institution included the Sultan and his family, the officers of his household, the executive officers of the Government, the standing army of cavalry and infantry, and a large body of young men who were being educated for service in the standing army, the court, and the Government. These men wielded the sword, the pen, and the sceptre. They conducted the whole of the government except the mere rendering of justice in matters that were controlled by the Sacred Law, and those limited functions that were left in the hands of subject and foreign groups of non-Muslims. The most vital and characteristic features of this institution were, first, that its personnel consisted, with few exceptions, of men born of Christian parents² or of the sons of such; and, second, that almost every member of the Institution came into it as the Sultan's slave, and remained the Sultan's slave throughout life—no matter to what height of wealth, power, and greatness he might attain. . . .

appear to have laid the foundations of something like the Ottoman system. For example 'Alā-ad-Dīn (reign 1296–1316) is recorded to have possessed 50,000 slaves, and Firūz (reign 1351–88) 180,000; and these Turkish slave-households in Hindustan were elaborately trained and organized (see Lane-Poole, S.: *Mediaeval India* (London 1903, Fisher Unwin), pp. 147–8). Thereafter, however, in Hindustan, the slave-system receded into the background; and in the institutions of the Timurid 'Mughals', who actually established the universal state of Hindu history, the slave-household was not at all prominent. Indeed, the principal evidence for the existence of this institution at the Mughal Court is indirect. It is an unverified inference from the established fact that, in the eighteenth century of the Christian Era, an ex-feudatory of the Mughals, the Nawwāb of Farrukhābād, Muḥammad Khān Bangash, is known to have 'maintained what was practically a replica in miniature of the Ottoman system. Hindu boys between the ages of seven and thirteen, some of them sons of Rājputs and Brahmans, were seized, bought, or accepted as *chelas* or slaves to the number of one or two hundred a year. They were taught to read and write, and were specially rewarded when the task was completed. Five hundred *chelas* from eighteen to twenty years of age were trained as a regiment of musketeers. From among the older *chelas* were chosen the officers of the household, generals of the army, and deputy governors of provinces'. (Lybyer, A. H.: *The Government of the Ottoman Empire in the Time of Suleiman the Magnificent* (Cambridge, Mass. 1913, Harvard University Press), p. 282, following Irvine, W.: 'The Bangash Nawabs of Farrukhābād', in the *Journal of the Royal Asiatic Society of Bengal*, 1878, pp. 340 seqq.)

We seem to catch a glimpse of the same institution in the universal state which, in the seventeenth century of the Christian Era, was imposed upon the main body of the Far Eastern Society by the Manchus: a barbarian people who (it is true) were not Nomads themselves, but who were in geographical contact with the easternmost hordes of the Mongol Nomads and were certainly responsive to Mongol cultural influences, as is shown by the Manchu adoption and adaptation of the Mongol version of the Syriac Alphabet. At the Manchu Court in Peking, 'it is curious and interesting that the Chinese officials referred to themselves, when received by the Emperor, as *ch'ien* (an official); it was the Manchu officials who used the term *nu* (a slave)—thus emphasizing that they were regarded as the Emperor's personal or "party" followers'. (Lattimore, O.: *Manchuria Cradle of Conflict* (New York 1932, Macmillan), p. 72.)

¹ Lybyer, A. H.: *The Government of the Ottoman Empire in the Time of Suleiman the Magnificent* (Cambridge, Mass. 1913, Harvard University Press). See also Miller, B.: *Beyond the Sublime Porte: The Grand Seraglio of Stambul* (New Haven 1931, Yale University Press), ch. iii, and an article by the same author on 'The Curriculum of the Palace School of the Turkish Sultan' in *Macdonald Presentation Volume* (Princeton 1933, University Press), chap. xxi.

² The Egyptian Mamlūks, in their latter days, were likewise recruited mainly from the children of Christian parents who were sold into slavery or were carried away captive in their childhood. The Orthodox Christian peasantry of Transcaucasia, which was the principal source of supply for the latter-day Egyptian Mamlūks, was also one of the recruiting grounds of the Ottoman slave-household.—A.J.T.

'The royal family . . . may rightly be included in the slave-family [because] the mothers of the Sultan's children were slaves; the Sultan himself was the son of a slave; and his daughters were married to men who, though they might be called vizier and pasha, wore these titles at the Sultan's pleasure, whereas they bore indelibly the title of *qūl* or slave. The Sultan's sons, though they might sit upon the throne, would be the consorts of none but slaves. Long before Süleymān's time, the Sultans had practically ceased either to obtain brides of royal rank or to give the title of wife to the mothers of their children. . . .¹

'Perhaps no more daring experiment has been tried on a large scale upon the face of the Earth than that embodied in the Ottoman Ruling Institution. Its nearest ideal analogue is found in the Republic of Plato,² its nearest actual parallel in the Mamlūk system of Egypt; but it was not restrained within the aristocratic Hellenic limitations of the first, and it subdued and outlived the second. In the United States of America men have risen from the rude work of the backwoods to the Presidential chair, but they have done so by their own effort and not through the gradations of a system carefully organized to push them forward. The Roman Catholic Church can still train a peasant to become a pope, but it has never begun by choosing its candidates almost exclusively from families which profess a hostile religion. The Ottoman system deliberately took slaves and made them ministers of state. It took boys from the sheep-run and the plough-tail and made them courtiers and the husbands of princesses; it took young men whose ancestors had borne the Christian name for centuries, and made them rulers in the greatest of

¹ In fact, the Ottoman Pādīshāhs bred their children from picked and chosen female slaves as their Nomad forbears on the Steppe had bred pedigree cattle from selected stock, and their attitude towards their own human progeny resembled their attitude towards the younglings of their flocks and herds. Sultan Mehmed II the Conqueror obtained a *fatvā* from the 'ulemā of his day in which it was declared lawful—in order to secure the peace of the World—for the Sultan's successors on the Ottoman throne to have all their brothers put to death. Sultan Mehmed issued an Imperial *qānūn* in which he made this precept jussive instead of merely permissive, and his successors duly carried out his instructions. Sultan Mehmed's condemnation of the majority of his own male descendants to a premature death by violence for the sole crime of being superfluous has become famous in our Western World as a hyperbole of inhuman barbarity; but we must suppose that the great Ottoman statesman felt no more compunction in condemning his own superfluous offspring to be strangled than a twentieth-century Western bourgeoisie feels when she condemns her pet cat's superfluous kittens to be drowned.—A.J.T.

² 'Plato would have been delighted with the training of the Sultan's great family, though his nature would have revolted from its lowliness of birth. He would have approved of the life-long education, the equally careful training of body and mind, the separation into soldiers and rulers (even though it was not complete), the relative freedom from family ties, the system's rigid control of the individual, and, above all, of the government by the wise. Whether the founders of the Ottoman system were acquainted with Plato will probably never be known, but they seem to have come as near to his plan as it is possible to come in a workable scheme. In some practical ways they even improved upon Plato—as by avoiding the uncertainties of heredity, by supplying a personal directing power, by insuring permanence through a balance of forces, and by making their system capable of vast imperial rule.' (Lybyer, *op. cit.*, p. 71.)

The Ottoman system was also Platonic in picking out and training women as well as men. 'The Imperial harem partook of the characteristics of the schools of pages' (Lybyer, *op. cit.*, p. 78); but, while the male and female departments of the household were trained, *mutatis mutandis*, on parallel lines, they were kept rigidly separate. 'Before the middle of the reign of Süleymān, no woman resided in the entire vast palace where the Sultan spent most of his time' (Lybyer, *op. cit.*, p. 121).—A.J.T.

Muhammadian states, and soldiers and generals in invincible armies whose chief joy was to beat down the Cross and elevate the Crescent. It never asked its novices "Who was your father?" or "What do you know?" or even "Can you speak our tongue?"; but it studied their faces and their frames and said: "You shall be a soldier and, if you show yourself worthy, a general", or "You shall be a scholar and a gentleman and, if the ability lies in you, a governor and a prime minister". Grandly disregarding that fabric of fundamental customs which is called "human nature", and those religious and social prejudices which are thought to be almost as deep as life itself, the Ottoman system took children for ever from parents, discouraged family cares among its members through their most active years, allowed them no certain hold on property, gave them no definite promise that their sons and daughters would profit by their success and sacrifice, raised and lowered them with no regard for ancestry or previous distinction, taught them a strange law, ethics, and religion, and ever kept them conscious of a sword raised above their heads which might put an end at any moment to a brilliant career along a matchless path of human glory.¹

It will be seen that the essence of the Ottoman system was the picking and training of 'human watch-dogs' to keep the Pādishāh's 'human cattle' in order and his human neighbours at bay. To become an Ottoman public slave of the highest order was the most arduous and dangerous and important and magnificent profession that could be followed by any subject of the Ottoman Pādishāh. Yet an essential, as well as an astonishing, rule of Ottoman statecraft was that this profession should be reserved almost exclusively for persons who were infidel-born²—without its mattering whether their infidel parents happened to be the Pādishāh's subjects or not—whereas the Pādishāh's own Muslim co-religionists were ineligible *ex officio religionis*, even if they happened to be the sons of the Ottoman feudal landed gentry who were the Pādishāh's equals in the sight of God and his companions in arms and even in some sense his social peers. This provision is astonishing because it is an extreme denial of natural expectations to disqualify the members of a conquering community from bearing rule;³ but, given the ability to enforce this disqualification, as it actually was enforced during at least two centuries of Ottoman history (*circa* A.D. 1365–

¹ Lybyer, *op. cit.*, pp. 36, 57–8, and 45–6.

² The only regular exceptions were the sons of members of the slave-household who had risen to one of the two highest classes—the class of administrative officials or the class of troopers in the household cavalry. These young men were Muslims, Muslim-born, in spite of the fact that their fathers must have been infidel-born *ex hypothesi*, since conversion to Islam, as well as infidel birth, was required of a slave as one of the necessary conditions for enrolment in the regular army or for appointment to an administrative office. Nevertheless, the sons of public slaves of either of the two highest classes were allowed, by special privilege, to follow in their fathers' footsteps. This privilege, however, did not extend to the next generation. The grandsons of pashas and sipāhis, and the sons of public slaves of lower rank, were disqualified for admission into the Pādishāh's slave household by being enfeoffed among the free Muslim landed gentry.

³ The point is put forcibly by Lybyer in *op. cit.*, p. 117.

1565), its utility is manifest. The Ottoman system of training a 'human watch-dog' made such severe demands upon human nature that only an individual who had been torn out of his own hereditary social environment, and had been introduced into the system as an isolated human atom, could be expected to submit to it. Now of all the human materials at the Ottoman Pādishāh's disposal, the least tractable were the children of his free Muslim feudatories with their pride of race and religion, their local connexions, and their family solidarity. The Ottoman Pādishāhs realized that, if once they were to admit this free-born and free-minded element into their household, an acute conflict would arise between the personnel and the system and that, in this trial of strength, it would not be the system that would prevail. Hence the ban upon the admission of free Muslims; and this drastic policy was justified by the sequel; for, when the free Muslims did at last force an entry into the household, the system did break down.

Until the time of that revolutionary and disastrous innovation, which began in the last years of Suleymān's reign,¹ the Sultan's slave-household was recruited—with the exceptions already mentioned—from infidel sources of supply. Recruits from beyond the Ottoman frontiers were obtained either by capture in war² or by purchase in the slave-market³ or by gift of previous owners⁴ or by voluntary enlistment.⁵ Recruits within the frontiers were obtained by the periodical levy of children by conscription. Through which-

¹ Lybyer, *op. cit.*, p. 69, note 3.

² We have works from the pens of two Western prisoners of war who were passed through the Ottoman system and who afterwards escaped to put their experiences on record. One of these is the German, Johann Schiltberger, who was taken prisoner in A.D. 1396 at the Battle of Nicopolis at the age of sixteen, spent six years as a slave in the service of Sultan Bāyezid I, was taken prisoner a second time, together with his Ottoman royal master, by Timur Lenk at Angora in A.D. 1402, spent twenty-five years more as a slave in the service of Timur, and finally succeeded in making his escape and finding his way back to Western Christendom. (German text of Schiltberger's narrative: Tübingen 1885, Literarischer Verein in Stuttgart; English translation by Telfer, J. B.: London 1879, Hakluyt Society). The second Western prisoner who has left a record of his experiences is Giovanni Antonio Menavino, a Genoese who was captured by the Barbary Corsairs at the age of twelve, about the year 1505. He was presented by his captors to Bāyezid II, was placed in the school of pages, and made his escape in 1514 during Selim I's expedition against Ismā'il Shāh Safawī. (Menavino, G. A.: *Trattato de' Costumi e Vita de' Turchi* (Florence 1548).)

³ The Ottoman slave-market was kept supplied by two sets of professional slave-raiders: the Barbary Corsairs (Ottoman colonists in Tunis and Algiers), who raided the sea-coasts of Western Europe by ship; and the Krim Tatars (a remnant of the Mongol horde of Qipchāq, which had survived under an Ottoman protectorate), who raided the steppe-coasts of Muscovy and Poland on horseback. Rycaut (*in op. cit. infra*, p. 81) estimates the average annual import of slaves from Krim Tatars to Constantinople at 20,000 head. The Tatars and the Algerines ought to be classed by our anthropologists among 'the higher hunters'.

⁴ e.g. by gift of the Barbary Corsairs (Rycaut, *op. cit. infra*, p. 25). This was how Menavino was acquired by Bāyezid II. (See footnote 2, above.)

⁵ The fourth of the four regiments of Ottoman household cavalry, i.e. the Ghurebā ('the Westerners'), was recruited entirely from non-Ottomans, both Muslim and Christian. The career of a renegade in the Ottoman service remained attractive to Western Christians until as late as the turn of the eighteenth and nineteenth centuries of the Christian Era.

ever of these channels the recruit made his entry into the Pādishāh's slave-household, and whatever the age at which he was received, he was put through a long and elaborate and strenuous course of training before he was gazetted to a post in the Ottoman public service.¹ The leading features of this Ottoman public educational system were a minute and constant supervision by the responsible officers;² a perpetual selection and specialization at every stage;³ and a stimulation of the candidates by the administration of the strongest possible incentives, both negative and positive. The discipline was meticulous and the punishments, though not unregulated, were savage,⁴ while on the other hand there was a deliberate and unceasing appeal to ambition. Every boy who entered the Ottoman Pādishāh's slave-household was—and was no doubt aware that he was—a potential Grand Vizier; and his prospects depended on his prowess, in competition with his contemporaries, in the course of his training.⁵ At each stage, he had the possibility of qualifying for a higher category of service; and success meant an immediate increase of pay (for these Ottoman slave-apprentices were paid from the outset),⁶ as well as a greater chance, in the future, of climbing to the top of the tree.

The method and spirit of the Ottoman educational system in its heyday are vividly portrayed in the following appreciation by a first-hand observer, the Flemish scholar and diplomat Ogier Ghiselin de Busbecq, who was resident in the Ottoman Empire, as ambassador to Süleymān the Magnificent from the Hapsburg Court at Vienna, during the years 1555–1562:⁷

'Every year the Turkish sovereign sends commissioners into different

¹ The usual age for passing out of the educational system and being appointed to a military or administrative post seems to have been 25 in all grades.

² Rycout, op. cit. *infra*, p. 25; Lybyer, op. cit., pp. 71–2. ³ Lybyer, op. cit., p. 83.

⁴ See the quotations from original authorities in Lybyer, op. cit., pp. 108–9, as well as the references on pp. 77–8. See also Rycout, op. cit. *infra*, pp. 2 and 26, and d'Ohsson, op. cit. *infra*, p. 205.

⁵ Lybyer, op. cit., p. 83.

⁶ Lybyer, op. cit., pp. 76–7 and 82–3. See further the table of 'Differential Allowances of Pages of Palace School' in Miller, 'The Curriculum of the Palace School', opposite p. 310.

⁷ Busbecq's observations on Ottoman affairs are contained in four letters written home, during his diplomatic mission in the Near East, to a friend in Western Christendom, Nicholas Michault, and in a subsequent pamphlet entitled *Exclamatio, sive de Re Militari contra Turcam instituenda Consilium*. These five papers are all printed in *A. Giselii Busbecqii Omnia quae Extant* (Leyden 1633, Elzevir). Busbecq observed the Ottoman System just before it passed its zenith. A century later, when the system was still outwardly intact but was verging towards its fall, it was observed again by another Western diplomatist of equal acumen, the Englishman Sir Paul Rycout, who served in the Levant first as English Consul at Smyrna and afterwards as Secretary of the English Embassy at Constantinople. His observations are recorded in *The Present State of the Ottoman Empire* (London 1668, Starkey and Brome). He states (p. 42) that his information has been taken 'from the mouth of one who had spent nineteen years in the schools of the Seraglio', and in another passage (p. 132) he cites 'one Albertus Bobovius, a Polonian by nation, but educated in the Seraglio and instructed in all the learning of the Turkish literature (from whom I freely confess to have received many of my observations)'. Thus Rycout had good informants, apart from what he saw himself. Finally, the Ottoman system was observed, when it lay in ruins, but before the rubble had been removed to

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 37
provinces who levy one in every three or four of the boys of Christian parentage.¹

'These boys are brought in droves to Constantinople; and there those of more gentlemanly appearance, and those who show signs of greater innate ability, are allocated to the domestic service of the sovereign himself or the pashas or other high officials.'²

'The rest are taken to a place where a great crowd of men of every condition, especially countryfolk, is gathered in waiting; and these apply to the official in charge for any boys who strike their fancy. The official hands over the boy to the applicant on payment of a gold piece, after entering in the public records the boy's name, birthplace, social status, and age, as well as any permanent physical marks of identity. Upon fulfilment of these formalities, the recipient of the boy—be he countryman or townsman—is at liberty to take the boy away with him across the sea to Asia or wherever he likes, according to his place of domicile, in order to break him in there as a slave by steady hard labour. The boy receives rations of bread and water, with an occasional seasoning of porridge or fruit or vegetables, and he is supplied with sufficient clothing to protect him against the inclemency of the weather. He is also instructed in the practice and the tenets of the Muhammadan religion. Thus the boy grows up a stranger to luxury, and with no parents to spoil him, until he becomes a strong man capable of standing any exertion.'³

'Then, when the Government requires the young man's services, it demands him back from the private master who has had him on deposit, and transfers him to the military service; and this is the seminary from

clear the ground for a new social structure, by Ignatius Mouradgèa d'Ohsson, a Levantine born and brought up in Turkey. His survey of the civil institutions of the Ottoman Empire in his day will be found in the seventh volume of his *Tableau Général de l'Empire Ottoman* (Paris 1788-1824, 7 vols.). See further the admirable descriptive bibliography in Lybyer, *op. cit.*, pp. 305-30. The text of a treatise on the Seraglio School from the hand of Bobovius himself has been discovered by Miss Miller (see Miller, *The Grand Seraglio*, p. 48).

¹ Actually, this levy (called *devrîshmè* or 'rotation') was made once in every four or five years (or at shorter intervals when the Pādîshāh's slave-household was depleted by heavy military casualties). Out of a total determined on each occasion by the Central Government, a quota was levied on each district. The commissioners who picked the children reviewed the boys of between 12 and 20 years of age, as shown on the parish priests' baptismal registers (Lybyer, *op. cit.*, pp. 51-2). Contemporary Christian evidence shows that parents were not always unwilling to see their children taken; and there were instances of Muslim parents evading the disqualification to which their own children were subject by bribing their Christian neighbours to exchange children surreptitiously (*op. cit.*, pp. 53-5). The use of violence was rare; and the forcible conversion of the Christian conscript children, though it did occur, was not countenanced by the Ottoman authorities (d'Ohsson, *op. cit.*, pp. 326-7). Forcible conversion was, indeed, usually superfluous, for the combined effect of segregation, education, and ambition would lead almost all Christian boys who entered the system to embrace Islam voluntarily before their time arrived for passing out and entering the public service. (See Lybyer, *op. cit.*, pp. 66-8.)—A.J.T.

² The further education of this *crème de la crème*, which was thus skimmed off and set apart at the outset, is described below (see the present quotation, seventh paragraph on pp. 39-40).—A.J.T.

³ The common run of conscript children, who were put out to be brought up by foster-masters in this way, were called '*Ajem-oghians*' ('alien boys'). For their training see further Lybyer, *op. cit.*, pp. 79-82, and Rycaut, *op. cit.*, Bk. I, ch. x. The rural foster-fathers seem to have been usually members of the free Muslim feudal landed gentry and not simple peasants (as Busbecq's description seems rather to imply that they were).—A.J.T.

38 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
which drafts are taken to make good the wastage in the ranks of the Janissaries.¹

Upon enrolment in the Janissaries, the cadet's pay starts at about a ducat and a half *per mensem*—a remuneration which is considered quite enough for a soldier who has yet to learn his trade. But, to insure that he is properly fed, he receives rations *gratis* from the mess of the platoon to which he is posted, on condition that he re-pays the platoon in scullion's-work and other fatigue duty. In return, the best master of arms in the platoon gives the cadet military instruction and teaches him, by daily practice, the science of handling his weapons. Thus the cadet acquires physical strength and endurance and professional skill; but he is still his messmates' inferior in rank and pay; and his sole hope of attaining equality with them lies in his own prowess: that is to say, if, in his first experience of active service, he gives a sufficiently good account of himself to be discharged from his probation and to be put on a par with the full-blown Janissaries in rank and pay. The hope of this reward stimulates many cadets to perform numerous feats of distinguished valour and to vie with the veterans in giving proof of their courage; and so they win the higher pay, which rises, for Janissaries, to a maximum of eight ducats *per mensem*.² If, however, a Janissary qualifies, through

¹ Busbecq here skips over an intermediate stage which is recorded in Rycaut, *op. cit.*, ch. x, and in Lybyer, *op. cit.*, pp. 79-82. The drafting of the '*Ajem-oghians*' into the Janissary Corps did not follow immediately upon their recall to Constantinople. The cream of them were thereupon selected for service, *en permanence*, in the Pādishāh's household as gardeners and in other menial non-military capacities (with a possibility of rising thereafter, by merit, to the lesser administrative posts in the Palace). The remainder were either drafted temporarily into the Navy or were hired out by the Government to private contractors to perform hard urban labour (as described by Busbecq in his next paragraph). It was from these two latter sub-categories of '*Ajem-oghians*' that the recruits for the Janissaries were eventually taken. In this last probationary stage, the '*Ajem-oghians*' were organized in companies (*odalar* or 'chambers'); and in each company facilities were provided for teaching any member, who wished to learn, to read and write (d'Ohsson, *op. cit.*, p. 327).—A.J.T.

² The Janissaries were a professional paid standing corps of 12,000 regular infantry—disciplined, drilled, uniformed (in uniforms of blue cloth, without armour), and equipped with muskets. In other words, they resembled the infantry of Western Christendom as it came to be in the eighteenth century; but they were so different from, and in every way so superior to, the Western infantry of the sixteenth century that they moved an intelligent Western observer of that age, such as Busbecq was, to astonishment and envy. The whole purpose of Busbecq's *Exclamatio*, from which the passage here quoted is taken, was to induce the sovereigns of Western Christendom to save themselves and their peoples from the Ottoman peril by raising troops of their own on this Ottoman model. The unfamiliarity of uniformed troops to sixteenth-century Western eyes comes out in Busbecq's description of Suleymān defiling through the streets of Constantinople at the head of his troops in A.D. 1559 (in Letter III: Elzevir edition, p. 246): 'The cavalry were followed by a long column of Janissaries, few of whom carried any weapons except muskets, which are their regular arm. They were dressed in uniforms of practically identical cut and colour, which marked them out as the slave-force, or slave-household, of a single master. There was no extravagance or exaggeration in their dress, no slashings or perforations. They say their clothes wear out quite fast enough, even without deliberately tearing them!'

As in the Roman standing army of the Imperial period, marriage was discountenanced, though in the case of the Janissaries it was not actually disallowed (Lybyer, *op. cit.*, p. 70). The unmarried Janissaries lived in barracks. They were organized in messes of ten members each ('For their living expenses each contributes so much a day; and they have a steward and a cook, who provide their necessary living': Ramberti, B.: *The Second Book of the Affairs of the Turks*, written in A.D. 1534, and translated from the Italian by Lybyer, in *op. cit.*, p. 249). Ten messes constituted an *orta* or company. A school-master was attached to each *orta* to teach any Janissary, who wished for instruction, to read and write (d'Ohsson, *op. cit.*, p. 327).

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 39
good conduct and distinguished service, for promotion, he is either given an officer's commission in his own corps or is enrolled in the household cavalry called *Sipāhīs*.¹

'The residue of the boys above-mentioned are kept in Constantinople and are employed in labour of various kinds. For instance, you may often see a couple of hundred or three hundred of them clearing a site, removing rubble, and transporting stones or timber or other heavy weights. None is allowed to live in idleness, and none receives his subsistence *gratis*. These likewise, upon reaching maturity, are transferred into the land or naval forces.'²

'As for those who are selected³ for the personal service of the sovereign at court, these generally end up as men of mark, and are appointed to the highest posts of public responsibility, according to their individual fortunes or characters.'⁴ From these are chosen the senior officers of

The corps was privileged in many ways. The *Pādīshāh* himself, from *Suleymān's* time onwards, was enrolled in a Janissary *orta* and drew Janissary's pay (*d'Ohsson*, op. cit., p. 354. Compare the similar practice of modern Western sovereigns, who likewise flatter their troops by wearing their own uniforms and holding honorary rank in their own service). If a Janissary were condemned to suffer capital punishment, the sentence could not be executed until the culprit had been expelled from the corps, and this could not be done without the corps' consent. (Compare the similar privilege of the Macedonian citizen army in the time of Alexander the Great.) When a Colonel-in-Chief of the Janissaries (*Yenicheri Aghasy*) died, his property escheated, not (like the property of all other high officials) to the Crown, but to the regimental chest (*Rycaut*, op. cit., p. 193). By *Rycaut's* time, the Corps had acquired corporate estates in Anatolia; and *'Ajem-oghlan*s destined for enrolment in the Janissaries were sent to these estates for the first stage of their training (*Rycaut*, op. cit., p. 192), instead of being put out to service with private foster-masters, as they were in *Busbecq's* day.—A.J.T.

¹ These '*Sipāhīs of the Porte*' (as distinct from the ordinary *Sipāhīs*, who were a territorial mounted militia of free feudal land-holders) were the *Pādīshāh's* professional paid household cavalry. Of the four regiments of which this regular cavalry force was composed, the fourth, called the *Ghurebā* or 'Westerners' (see footnote 5 on p. 35, above), was a foreign legion. The rest were recruited partly from Janissaries who had earned promotion and partly from Imperial Pages (see below). Troopers recruited from the latter source were men of literary education (*Rycaut*, op. cit., p. 184).—A.J.T.

² As noted above (in footnote 1, on p. 38), this was a stage which all *'Ajem-oghlan*s—including those eventually drafted into the Janissaries—had to pass through upon their recall to Constantinople from the Interior of Anatolia, with the sole exception of those who were appointed at this stage to menial non-military posts in the Palace service.—A. J. T.

³ i.e. selected at the outset, upon the first arrival of the conscript children at Constantinople, when the remainder were put out into private service with foster-masters in the Anatolian countryside to be brought up as *'Ajem-oghlan*s.—A.J.T.

⁴ These boys, who were selected from the outset to be Imperial Pages, were called *Ich-oghlan*s ('Interior Boys', i.e. boys admitted to the *Pādīshāh's* privy service) in distinction from the *'Ajem-oghlan*s ('Alien Boys'). They were an *élite*—numbering not more than 2,000 in all at any given moment, while there were perhaps as many as 20,000 *'Ajem-oghlan*s. It was on the quality of the *Ich-oghlan*s that the performance of the Ottoman *tour de force* ultimately depended, and these Imperial Pages were given a special education throughout. When the *'Ajem-oghlan*s were drafted off to their foster-masters in Anatolia, the *Ich-oghlan*s were placed in one or other of three residential schools (one in *Stamboul*, one in *Galata*, and one in *Adrianople*), which were the first rung in an educational ladder of four grades. The three higher grades were represented by six halls, culminating in the Hall of the Imperial Bedchamber (*Khāṣ Oda*), which were all situate within the precincts of the *Seraglio*; and here the *Ich-oghlan*s received an education which was both liberal and professional and both intensive and many-sided. They were first educated in Arabic and Persian literature, and afterwards in athletic and military accomplishments. They also had to learn some handicraft—an element in all Ottoman higher education, including that of the *Pādīshāh* himself (*Suleymān the Magnificent*, anticipating the precepts of Mr. Gandhi, is reported to have devoted a certain time every day to working at his handicraft: *Lybyer*, op. cit., p. 76; cp. *Withers*, R.: *Description of the Grand Signor's Court* (London 1650, Martin and Ridley), p. 78; and *Miller*, *The Grand Seraglio*, pp. 68–9, and 'The Curriculum of the Palace School', pp. 307–8). The Arabic

the Janissaries, the admirals of the fleet, the beylerbeys and—at the top of the tree—the Vizier Pashas.¹ To these, again, the sovereign's own daughters are given in marriage.

'I think I have now sufficiently elucidated the origin, selection, discipline and education of this Turkish soldiery which has made itself so greatly feared the whole World over. At the same time, I will not deny that there are other avenues of entry into the Turkish military service, though the system which I have described is the most usual way. For the Turks do occasionally also make recruits of the boys or young men whom they take prisoners in raids or in regular warfare against Western Christendom.

and Persian literary education corresponded to the contemporary Western education in the Greek and Latin humanities.

Rycaut, however, notes (in *op. cit.*, p. 32) that the *Ich-oghlan*'s curriculum included no mathematics or physical science or geography. Moreover, printing was still rigorously forbidden in Turkey in Rycaut's day—an ominous symptom of mental rigidity.

Geography was certainly a science of which the statesmen and admirals of the Ottoman Empire remained abysmally ignorant. There is a legend of an Ottoman admiral who was sent out with orders to capture Malta and who returned to Constantinople, after cruising round the Mediterranean for many weeks, to report '*Malta yoo!*' ('There is no Malta'). Again, in the great Russo-Turkish War of 1768-74, when the Ottoman Government received intelligence from friendly Powers in Western Europe that the Russians were fitting out a fleet in the Baltic for service in the Mediterranean, they are said to have ignored the warning in the belief that the Baltic and the Mediterranean were not connected with each other by any through-waterway!—A. J. T.

¹ Instances of *Ich-oghlan*s who eventually distinguished themselves by rising to the highest offices of state are noted in Jorga, N.: *Geschichte der Türkei* (Gotha 1908-13, Perthes, 5 vols.), especially in volume ii, pp. 199 seqq. For example, Mahmūd Pasha, who was Grand Vizier in A.D. 1453-67, and again in 1472-3, was the son of a Greek father and a Serbian mother. He had been captured by Osmanli raiders in childhood (Jorga, *op. cit.*, vol. ii, p. 200). Mawla Khosrev, who rose to the highest Ottoman posts in the Islamic legal career as qādi of Constantinople and Grand Mufti in the reign of Sultan Mehmed II the Conqueror, was of Greek parentage (*op. cit.*, vol. ii, p. 202). Khurrem (called by Franks '*La Rossa*' and by Frankish pedants '*Roxalana*'), who was Suleymān's favourite slave-concubine and who so won the Pādishāh's heart that he broke the long-established rule of the dynasty by making her his legally wedded wife, was a Russian girl who had been captured on a slave-raid by the Tatars of Krim, sold to the Porte, and educated in the female section of the Pādishāh's slave-household (*op. cit.*, vol. ii, p. 345). İbrāhīm of Parga, who was Grand Vizier in A.D. 1523-36, was the son of an Albanian peasant (on whom he afterwards conferred a *sanjāq* or provincial governorship). İbrāhīm had been enslaved at the capture of Santa Maura, selected for an *Ich-oghlan*, and brought up at Mānysa with Suleymān before the latter came to the throne (*op. cit.*, vol. ii, pp. 347-9). Mustafā of Cattaro, who was second vizier under İbrāhīm and who was also Sultan Suleymān's brother-in-law, was a Serb who had been born a Venetian subject (*op. cit.*, vol. ii, pp. 249-50). Ayas of Khimarra, who was third vizier under İbrāhīm, was the son of a Christian peasant-woman. While he had become a vizier at Constantinople, his mother had become a nun at Avlona, and Ayas used to remit an annuity to her there (*op. cit.*, vol. ii, p. 350). Rustem, who was İbrāhīm's successor in the Grand Vizierate and who received in marriage Mihrmah, Suleymān's daughter by Khurrem, was a Serb (*op. cit.*, vol. ii, p. 350); and Mehmed Sököllü (Sokolovic), who was Grand Vizier at the close of Suleymān's reign and the opening of Selim II's reign for fifteen years without a break, had started life as an acolyte in a Serbian church. One of Mehmed's acts as Grand Vizier was to restore the 'autocephaly' of the Serbian Orthodox Church and to instal one of his own relatives called Makarios, who had remained an Orthodox ecclesiastic, in the resuscitated Serbian Patriarchate of Ipek (Peć) (*op. cit.*, vol. iii, p. 167; and Temperley, H. W. V.: *History of Serbia* (London 1917, Bell), pp. 123-4. The date of Sököllü's restoration of the 'autocephalous' Serbian Patriarchate at Ipek was A.D. 1557). Counting in Mehmed Pasha Sököllü, who was still in office when Suleymān died, and Mehmed Pasha Piri, whom Suleymān had found in office at his accession, the Grand Vizierate was occupied by nine different persons in Suleymān's reign, with terms of office which amounted in the aggregate to sixty-two years. All nine, with the sole exception of Mehmed Piri, were men of infidel birth who had passed through the slave-household (Lybyer, *op. cit.*, p. 167). For the Dalmatian Slav 'Ali, who was Grand Vizier in A.D. 1561-5, between the Grand Vizierates of his fellow-Serbs Rustem and Mehmed Sököllü, see Busbecq's *Turkish Letters*, *passim*.—A. J. T.

‘These prisoners are immured for years on end in the cloister-like palaces which they call *serays*. When, in this confinement, they are judged to have lost all memory of, and all feeling for, their Western homeland and civilization, and to have made sufficient progress in the practice of Arabic letters and Turkish arms under eunuch instructors, they are eventually let out of their prison-house by their Ottoman masters, and are appointed to the branches of the military service for which they appear best fitted. Recruits are also taken from among the slaves acquired—in war or otherwise—by the Pashas and other Imperial Grandees. At the same time, no prospective recruit from any of these categories is ever accepted without definite scrutiny and consideration. In every single case there is a preliminary investigation into the candidate’s physique and character, to make sure of his being equal to the position assigned to him.

‘In this connexion, I have found myself again and again struck with wonder at the sheer power of the Turkish system of discipline and education, when I have seen men who in our world had been despised and rejected making such progress in a few years in the Turkish environment that they were not only able to acquit themselves uncommonly well as common soldiers but were considered worthy, in the unanimous opinion of the Turks, of being entrusted with the duty of serving as military instructors to others.

‘It has sometimes happened that, when I have been sitting, for recreation, at my window and looking out upon the public thoroughfare, Turks, sitting at my elbow, have pointed out to me passers-by who (they have told me) have been put in charge of the training of recruits on account of their own expertness in arms. I have then asked what these men’s nationality was—imagining to myself that champions who enjoyed such a reputation as masters of arms among the ‘Osmanlis must be Khurāsānis or Balkhis or Uzbeks or something of the kind (*nescio quos Parthos aut Bactrianos aut Massagetas*). Then I have been told that this one was a Hungarian, that one a Croat, the third a German. At this I have been much surprised; but I have imagined to myself that this outstanding proficiency in arms must have been the consequence of previous practice in the use of Western arms at home, and that these men must have been of noble birth and have received a liberal education and have seen military service [before their capture]. So I have proceeded to inquire from my Turkish informants whether they knew what station in life these men had occupied at home and what career they had followed. My Turkish friends have then searched their memories and told me that now they remembered: this one (they have said) would tell you that he had been, may be, a cook’s son, the second a novice in a monastery, the third a publican’s bar-tender. They had been captured in war-time or in time of truce, had been brought to Constantinople with other prize of war, and had thus entered the household of this or that Pasha.

‘At this point, I have become more surprised than ever, and have asked how on earth it could happen that they should turn into such doughty warriors. Then my Turkish friends have explained that the

masters into whose possession these prisoners had passed retained in their palaces distinguished men who were masters of arms and who were equipped with a profound experience and knowledge of the military art. To these masters the prisoners were handed over for instruction (if the masters judged, by their intuition of the prisoners' physique and character, that they were worth the trouble); and, under this tutelage, the men had made such rapid progress that they had outstripped all their contemporaries and had given good earnest of their own future prowess. There had followed campaigns in which they had done yeoman service and had brought back a reputation for distinguished valour on the unanimous testimony of their comrades in arms. Hence the positions of high authority to which they had attained.

'When I have heard this explanation, I have been cut to the heart by the thought of the great gulf that lies between this Turkish practice and our Western way of doing things. And I have envied the Turks this system of theirs. It is always the way of the Turks, whenever they come into possession of a man of uncommonly good parts, to rejoice and be exceeding glad, as though they had found a pearl of great price. And, in bringing out all that there is in him, they leave nothing undone that labour and thought can do—especially where they recognize military aptitude. Our Western way is different indeed! In the West, if we come into possession of a good dog or hawk or horse, we are delighted, and we spare nothing in our efforts to bring the creature to the highest perfection of which its kind is capable. In the case of a man, however—supposing that we happen to come upon a man of signal endowments—we do not take anything like the same pains, and we do not consider that his education is particularly our business. So we Westerners obtain many sorts of pleasure and service from a well-broken-in horse, dog and hawk, while the Turks obtain from a man whose character has been cultivated by education (*ex homine bonis moribus informato*) the vastly greater return that is afforded by the vast superiority and pre-eminence of Human Nature over the rest of the Animal Kingdom.'

The fine fruits which were the product of this wonderful system of human cultivation are depicted by Busbecq himself in a passage in the first of his four Turkish Letters, in which he is describing his visit to Sultan Süleymān's camp at Amasiyeh in A.D. 1555:

'The Sultan's head-quarters were crowded by numerous attendants, including many high officials. All the Cavalry of the Guard were there—the Sipāhīs, the Ghurebā, the Ulufajīs—and a large number of Janisaries. In all that great assembly, no single man owed his dignity to anything but his personal merits and bravery; no one is distinguished from the rest by his birth; and honour is paid to each man according to the nature of the duty and offices which he discharges. Thus there is no struggle for precedence, every man having his place assigned to him in virtue of the function which he performs. The Sultan himself assigns

¹ Busbecq, O. G.: 'Exclamatio, sive de Re Militari contra Turcam instituenda Consilium', in *A. Gisleii Busbequii Omnia quae Extant* (Leyden 1633, Elzevir), pp. 432-9.

to all their duties and offices, and in doing so pays no attention to wealth or the empty claims of rank, and takes no account of any influence or popularity which a candidate may possess; he only considers merit, and scrutinizes the character, natural ability, and disposition of each. Thus each man is rewarded according to his deserts, and offices are filled by men capable of performing them. In Turkey every man has it in his power to make what he will of the position into which he is born and of his fortune in life. Those who hold the highest posts under the Sultan are very often the sons of shepherds and herdsmen, and, so far from being ashamed of their birth, they make it a subject of boasting, and the less they owe to their forefathers and to the accident of birth the greater is the pride which they feel. They do not consider that good qualities can be conferred by birth or handed down by inheritance, but regard them partly as the gift of Heaven and partly as the product of good training and constant toil and zeal. Just as they consider that an aptitude for the arts, such as music or mathematics or geometry, is not transmitted to a son and heir, so they hold that character is not hereditary, and that a son does not necessarily resemble his father, but [that] his qualities are divinely infused into his bodily frame. Thus, among the Turks, dignities, offices, and administrative posts are the rewards of ability and merit; those who are dishonest, lazy and slothful never attain to distinction, but remain in obscurity and contempt. This is why the Turks succeed in all that they attempt and are a dominating race and daily extend the bounds of their rule. Our method is very different; there is no room for merit, but everything depends on birth, considerations of which alone open the way to high official position. On this subject I shall perhaps say more in another place, and you must regard these remarks as intended for your ears only.

'Now come with me and cast your eye over the immense crowd of turbaned heads. . . . What struck me as particularly praiseworthy in that great multitude was the silence and good discipline. There were none of the cries and murmurs which usually proceed from a motley concourse, and there was no crowding. Each man kept his appointed place in the quietest manner possible. The officers . . . were seated; the common soldiers stood up. The most remarkable body of men were several thousand Janissaries, who stood in a long line apart from the rest and so motionless that, as they were at some distance from me, I was for a while doubtful whether they were living men or statues, until, being advised to follow the usual custom of saluting them, I saw them all bow their heads in answer to my salutation.'¹

Such were the 'human watch-dogs' that were bred by the Ottoman 'shepherds of men' in order to perform the *tour de force* of keeping the whole of Orthodox Christendom in subjection and holding the whole of Western Christendom at bay. The twentieth-century Western student of history, who can no longer see the

¹ Original Latin text in *A. Gisleii Busbequii Omnia quae Extant* (Leyden 1633, Elzevir), pp. 99-102; English translation, here quoted, by Forster, E. S.: *The Turkish Letters of Ogier Ghiselin de Busbecq* (Oxford 1927, Clarendon Press), pp. 59-62.

Ottoman slave-household with a Busbecq's, or even with a Rycaut's, living eye, can still conjure up a vivid image of this long since defunct institution's former power by paying a visit to a building on the outskirts of the Seraglio grounds in Stamboul which was once the Orthodox Christian church of St. Irene before it became the Ottoman military museum. As the visitor's eye falls upon the apse, piled high with 'breasts' and 'backs', gorgets and cuisses, helmets and morions, and all the elaborate apparatus of sixteenth-century and seventeenth-century Western armour, lying in profusion, disregarded, just where the pieces happened to be thrown down when they were first brought in as spoils of war, perhaps three centuries or four centuries ago,¹ it is borne in upon the visitor's mind how easily the 'Osmanlis performed their stupendous *tour de force* so long as they kept themselves in training. 'The weapons of war' are 'perished'; but, by the same token, 'How are the mighty fallen'.²

The Ottoman system fell because of its 'grand disregard for human nature';³ but it was not the inhuman—or superhuman—severity of the training and discipline that brought this extraordinary institution to the ground. The Pādishāh's slave-household did not perish for lack of man-power, through failure to compel flesh and blood to continue to undergo its rigours. It perished by suffering the violence of the violent who took it by force, because every man pressed in to share its privileges.⁴ The evil that ruined it was not depletion but dilution. The 'fundamental customs' which the Pādishāh's will-power proved unable permanently to set at naught were the pretensions of birth and heredity; and the first breach was made by men who, having known what it was to be the Pādishāh's slaves themselves, were determined to secure the same boon for their sons. A concession had always been made to the principle of heredity in the privilege of enrolling their sons (though not their grandsons) among the Pādishāh's slave-boys which was already accorded to the Sipāhis of the Porte.⁵ On this analogy, Suleymān, towards the close of his reign, began to tolerate the enrolment of Janissaries' sons among the '*Ajem-oghlan*s; and his successor Selim II celebrated his advent to the throne by formally extending to the Janissaries the Sipāhis' privilege.⁶ This concession

¹ The 'Osmanlis themselves despised armour—perhaps on account of their own proficiency in the use of long-range missile weapons. (They inherited an aptitude for archery from their Nomad ancestors, and they took kindly to fire-arms.) The Janissaries wore no armour at all, and the Sipāhis seldom bothered to take any with them when they started on a campaign, since they counted upon being able to capture all that they wanted from the enemy. When they did wear armour acquired in this way, the Sipāhis made a point of choosing pieces that did not fit, in order to show that they were hermit-crabs.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 45 opened the floodgates; for, when once the Janissaries had thus pressed in, it became a psychological impossibility to keep the free Muslim feudal gentry out any longer.

In fact, between 1574 and 1595, admission to the Janissary Corps was made open to all free Muslims except Negroes;¹ and the sequel shows that inflation produces the same results, with the same rapidity, in a human as in a monetary currency. Down to Suleymān's death, the strength of the Janissary Corps was little more than 12,000, and the total strength of the whole slave-household, on the widest reckoning, was only about 80,000.² By A.D. 1598 there were 101,600 Janissaries, alone, on the pay-rolls—not to speak of 150,000 'supernumeraries' who were enrolled though unpaid, and an unknown quantity of honorary 'aspirants'.³ The 'supernumeraries' earned their living by engaging in trade, and there was a tendency for each *orta* to specialize in a particular craft.⁴ The consequence was a collapse of Ottoman military discipline and efficiency.

In psychological 'compensation' for the severity of their upbringing and the sobriety of their normal régime, the Janissaries, even in their best days, had always been prone, in peace-time, to

¹ d'Ohsson, op. cit., p. 328. There appears to have been some attempt, even at this stage, to reserve the higher posts in the civil administration for infidel-born graduates from the Schools of Pages. In A.D. 1582 a free Muslim-born 'Osmanli was refused the Grand Viziership on the ground of his birth. (Finlay, George: *A History of Greece from its Conquest by the Romans to the Present Time* (Oxford 1877, Clarendon Press, 7 vols.), vol. v, p. 40, footnote 2.)

² Before inflation, the Ottoman Pādishāh's slave-household appears to have been constituted approximately as follows:

1. Boys in process of education:				
<i>Ich-oghlan</i>	.	.	.	2,000
<i>'Ajem-oghlan</i>	.	.	.	20,000
				<hr/> 22,000
2. <i>Ex-'ajem-oghlan</i> s in non-military service:				
Palace Gardeners	.	.	.	2,000
Other Palace menials	.	.	.	500
On hire to private employers	.	.	.	5,500
				<hr/> 8,000
3. <i>Ex-'ajem-oghlan</i> s in temporary naval service				2,000
4. Regular Army:				
Sipāhīs of the Porte	.	.	.	12,000—
Janissaries	.	.	.	12,000+
				<hr/> 24,000
5. Slave troopers maintained by the Sipāhīs of the three senior regiments of household cavalry at their own charges				30,000

On this showing, the Sultan's slave-household mustered 56,000 head excluding, and 86,000 head including, the slaves of slaves, while that part of the household which constituted the Regular Army mustered only 26,000 on the former reckoning and 56,000 on the latter. (Figures in Lybyer, op. cit., pp. 49, 80, 98, and 130.) The feudal cavalry, including the men-at-arms whom the fief-holders brought into the field with them, totalled something between 80,000 and 100,000 (Lybyer, op. cit., p. 104); but considerations of distance and expense made it impossible for the whole feudal force ever to be mobilized *in toto* for any given campaign. Thus the largest army which the Ottoman Power, at its zenith, was able to put into the field can hardly have reached six figures.

³ d'Ohsson, op. cit., pp. 330-2. In Rycaut's time there were 100,000 Janissaries on the rolls, of whom only 20,000 were effectives. (Rycaut, op. cit., pp. 171 and 191.)

⁴ d'Ohsson, op. cit., p. 332.

sudden outbreaks of temper and turbulence which contrasted oddly with their customary good behaviour; and on active service their contumacy compelled Selīm I to halt at Tabriz¹ and Süleymān to halt before Vienna,² as Alexander had been brought to a halt by his Macedonians on the west bank of the Ganges. Yet, in Busbecq's day, the discipline of the Janissaries was still so exemplary on the whole that they were employed as a military police to protect the Pādishāh's non-Muslim 'human cattle' against molestation from the free Muslim population of the Empire.³ By Rycaut's time, hardly more than a century later, these 'human watch-dogs' had 'returned to Nature' by reverting into wolves, who harried the Pādishāh's 'human cattle' instead of looking after them and keeping them in order. The Orthodox Christian subject population was now cheated of the *Pax Ottomanica* which had originally reconciled it to bearing the Ottoman yoke. The Pādishāh's *ra'iyeh* were being plundered and enslaved by the Pādishāh's own troops as though they were the inhabitants of enemy countries;⁴ and in A.D. 1683, when the Anatolian feudal cavalry were marching to join the Ottoman Army for the second—and last—Ottoman siege of Vienna, the villagers in the Rumelian provinces on the line of march burnt their houses and fled to the mountains rather than await their oppressors' passage.⁵ In Rycaut's time, the pristine Ottoman discipline still survived on active service, as Rycaut himself testifies from his own personal observation of the Ottoman Army which was operating against the Danubian Hapsburg Monarchy in A.D. 1665.⁶ But in the great war of A.D. 1682–99 between the Ottoman Empire

¹ See I. C (i) (b), Annex I, vol. i, p. 386, above.

² Lybyer, *op. cit.*, pp. 92–3.

³ The Janissaries 'are scattered through almost every part of the Empire, either to garrison the fortifications against the enemy, or to protect the Christians and Jews from the violence of the mob. There is no district which is at all populous, and no city or town, that has not a detachment of Janissaries to protect the Christians and Jews and other helpless people from criminal assault'.—Busbecq, Letter I, Elzevir edition, p. 24.

⁴ Rycaut, *op. cit.*, pp. 170–1. See the passage quoted above in II. D (vii), vol. ii, on p. 265 in footnote 2.

⁵ Finlay, George: *A History of Greece from its Conquest by the Romans to the Present Time* (Oxford 1877, Clarendon Press, 7 vols.), vol. v, p. 159.

⁶ 'In the Turkish camp, no brawls, quarrels, nor clamours are heard; no abuses are committed on the people by the march of their Army, all is bought and paid with money, as by travellers that are guests at an inn; there are no complaints by mothers of the rape of their virgin-daughters, no violences or robberies offered on the inhabitants' (Rycaut, *op. cit.*, p. 203). In the seventeenth-century English observer's opinion, 'this regulation . . . proceeds from nothing more than the strict prohibition of wine upon pain of death'. A twentieth-century observer, the writer of this Study, was equally struck by the exemplary behaviour of a Turkish force which reoccupied the Anatolian town of Ismid, in provocative circumstances, after its evacuation by the Greek Army in A.D. 1921. Though the Greek troops, before their departure, had massacred the Turkish civilian population, plundered their property, burnt their houses, and slaughtered pigs in their mosques, the victorious incoming Turkish troops refrained from making any reprisals upon the persons or property or churches of the Greek civilian population, which had been left at their mercy by the withdrawal of the Greek Army. In A.D. 1921, as in A.D. 1665, the penalty in the Turkish Army for drinking alcohol on active service was death.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 47
and the Powers of Western Christendom—a war which began with the second Ottoman siege of Vienna and ended with the first of a series of Ottoman territorial losses that continued thereafter until A.D. 1922—the superiority in discipline and efficiency passed definitively from the Ottoman to the Western camp; and in the eighteenth century of the Christian Era, when Western armies rose to the level at which the Ottoman Army had stood two centuries earlier, the Ottoman Army itself degenerated into the kind of rabble that had done duty for a Western army in Busbecq's day.

The sequel to this decay of the Ottoman slave-household has brought to light the insuperable rigidity which was the fatal defect of its otherwise extraordinary qualities. For the 'Osmanlis have not found it possible to respond to the tremendous challenge from the West, to which the failure of their own indigenous institutions has exposed them, by reconditioning the peculiar social system which they had invented to meet their own special needs and which had served them so well, for a season, by carrying them to a dizzy height of military and political greatness. Once thrown out of gear, the Ottoman system has proved wholly incapable of being either repaired or remodelled; and since the close of the seventeenth century of the Christian Era, at latest, its wreckage has been nothing but an incubus. Ever since they were first thrown on the defensive, the 'Osmanlis have been forced to seek salvation in a wholly different quarter and through wholly different measures. They have been compelled to take *Fas est et ab hoste doceri* for their motto, and to borrow for their own defence the alien arms and armour with which they have latterly been worsted by the once despised and long thereafter hated peoples of the West. This has been the inevitable path which all Ottoman reformers, for the past two and a half centuries, have had to follow, whether they have trodden the road of Westernization with personal repugnance or with personal enthusiasm.¹

As soon as the turn in the tide of war, which came in the latter part of the seventeenth century of the Christian Era, had rendered the art of diplomacy at least as important as the art of war itself for the welfare of the Ottoman Empire in its intercourse with the West, the Pādishāh found himself constrained to create new official posts of great responsibility and power to be occupied by Orthodox

¹ The psychological history of Ottoman 'Westernization', which has been touched upon in II. D (v), vol. II, pp. 186–8, above, is a classic illustration of a famous Stoic text:

Ἄγου δέ μ', ὦ Ζεῦ, καὶ σὺ γ', ἡ πεπωμένη,
ὅποι ποθ' ὑμῖν εἰμι διατεταγμένος,
ὡς ἔφομαι γ' ἄοκνος· ἦν δέ γε μὴ θέλω,
κακὸς γενόμενος, οὐδὲν ἤττον ἔφομαι.

(Cleanthes in J. von Arnim's *Stoicorum Veterum Fragmenta*, vol. I (Berlin and Leipzig 1905, Teubner), p. 118.)

Christian subjects of his who had not been transformed from 'human cattle' into 'human watch-dogs' through being conscripted and educated as pages in the Pādishāh's own palace. The imperious reason which dictated this revolutionary inversion of the established practice was that the traditional curriculum of the Ottoman schools for pages would leave a Greek boy-conscript destitute of the now precious knowledge of Western languages and Western ways, while this same knowledge would be acquired almost as a matter of course by the conscript-boy's rejected brother who had been allowed to be brought up at home and to follow a commercial career in his Greek father's footsteps.¹

The 'Osmanlis experienced their next great humiliation in the Russo-Turkish War of A.D. 1768-74, when they suffered a signal defeat at the hands of the Muscovites—'poor relations' of the 'Osmanlis' own Orthodox Christian *ra'īyeh* who had stolen a march upon the 'Osmanlis themselves by their greater promptitude in borrowing the new Western military technique. The shock administered to the Pādishāh's self-esteem and sense of security by the peace-terms to which his Government was compelled to subscribe in A.D. 1774 at Kūchūk Qaynarjy, stimulated Sultan Selim III (*imperabat* A.D. 1789-1807) to drill a contingent of the free Muslim citizens of his Empire into the nucleus of a new model army on Western lines;² and this first essay in the 'Westernization' of the Ottoman military establishment was the thin end of a wedge which has since penetrated to the heart of Ottoman life until the process has been completed, on every plane and in every sphere, by President Mustafā Kemāl in our day.

The metamorphosis of the Ottoman body-social which Selīm began and which Mustafā Kemāl has carried to its logical conclusion is as wonderful a *tour de force*, in its way, as the creation of the Pādishāh's slave-household by an earlier line of great Ottoman statesmen. Yet a comparison of the respective results of these two performances brings out the relative triviality of the second. The makers of the Ottoman slave-household forged an instrument which enabled a tiny band of Nomads, who had been ejected from their native Steppe and cast away in an alien environment, not merely to survive and hold their own in this strange world, but to impose

¹ For the success with which the Phanariots qualified themselves, under the stimulus of penalization, for making the most of this opportunity, see II. D (vi), vol. ii, pp. 223-5, above. The social adaptability of these Ottoman *ra'īyeh* throws the social rigidity of the 'Osmanlis themselves into strong relief. In A.D. 1793, Sultan Selim III, as part of his 'Westernization' programme (see below), established Ottoman diplomatic missions in Paris, Vienna, London, and Berlin and appointed Turks as ambassadors; but his Turks proved so incompetent in this unfamiliar environment that they had to be replaced by Greek *chargés d'affaires* (d'Ohsson, *op. cit.*, p. 573).

² Selim's bombardier corps was organized for him by Western renegades (d'Ohsson, *op. cit.*, p. 369).

peace and order upon a great Christian society which had gone into disintegration, and to threaten the life of a yet greater Christian society which has since cast its shadow over the whole of the rest of Mankind. Our latter-day Turkish statesmen have simply filled part of the vacuum which has been left in the Near East through the disappearance of the incomparable structure of the old Ottoman Empire by erecting on the desolate site a ready-made 'go-down' of a standard Western pattern in the shape of a Turkish national state. And in this commonplace 'villa-residence' the Turkish legatees of the arrested Ottoman Civilization are to-day content—like the Zionist legatees of a fossilized Syriac Civilization¹ next door and the Irish legatees of an abortive Far Western Christian Civilization² across the street—to live henceforth in comfortable nonentity as a welcome escape from the no longer tolerable status of being 'a peculiar people'.

The grateful acquiescence in this *pis aller*, which is the prevalent state of mind among Ottoman Turks of the present generation, gives some measure of the failure to which the old Ottoman institutions have been condemned in the long run by their intractable rigidity, in spite of their amazing efficacy to fulfil the precise functions for which they were originally designed. The denouement is almost ridiculous, yet it has only been achieved through long and painful travail. Selīm III's pioneer effort to supplant the long since useless Janissaries cost the bold reformer his throne and his life; and his cousin Mahmūd II, who shared Selīm's outlook and cherished his policy, had to keep his own counsel³ and watch for his opportunity for eighteen long years⁴ before he was able to emulate the

¹ See II. D (vi), vol. ii, pp. 252-4, above.

² See II. D (vii), Annex III, vol. ii, pp. 425-6, above.

³ Mahmūd ascended the throne at the age of 25 in succession to his brother Mustafā IV, who had been deposed and murdered after a reign of only a few months when he had served the Janissaries' turn as a pretext for deposing and murdering Selim.

⁴ In girding himself for the task of clearing away the debris of the slave-household, Sultan Mahmūd II did not have to start *ab initio*; for some of the dead wood had already been cut out by his predecessors. According to Finlay (in op. cit., vol. v, pp. 35-7), the *devrîshme* or rotational conscription of Ottoman Christian children fell into disuse during the reign of Sultan Mehmed IV (*imperabat* A.D. 1649-87); and Rycout (in op. cit., first published in A.D. 1668) speaks of this institution as obsolete in several passages (on pp. 80, 191, and 197). In another passage, however (on pp. 40-1), Rycout states that about 2,000 boy-conscripts for the *Ajemi-oghlan* were still being recruited annually, chiefly from the Morea and Albania. Possibly he is here following some informant in the Seraglio who was describing things as they had been one or two decades back. That the *devrîshme* had actually been abandoned before the end of Mehmed IV's reign is indicated—though this is only presumptive evidence—by the fact that two out of the three extramural preparatory schools for *Ich-oghlan* were closed by İbrâhîm I and the two lowest of the six halls inside the Seraglio by Mehmed IV thereafter. In d'Ohsson's day, none but the Galata Seray remained; and the Sultans, who had once spent their lives in their pages' company, now only visited the school once in every two or three years. Vestiges of the original discipline and curriculum survived; and the school still provided pages for the Pâdishâh's personal domestic service; but the promotion of pages to be high officials, or even lifeguardsmen, had long since been abandoned (d'Ohsson, op. cit., pp. 47-53). Thus Sultan Mahmūd II found part of his work already done for him; and even the idea of deliberately destroying the Janissaries was not new. Rycout declares his

50 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
greatest of his subjects by extirpating the Janissaries in 1826 as the Mamlûks had been extirpated in 1811 by Mehmed 'Ali.¹

The Spartans

If it is possible that the Ottoman slave-household, at its zenith, came as near as might be to realizing the social ideal of Plato²—and this on the Hellenic philosopher's own native soil—it is certain that Plato himself, when he conceived his Utopia, was inspired by the actual institutions of the Spartan city-state: a Hellenic community which was the greatest among the Great Powers of the Hellenic World in Plato's day. A direct comparison between the Spartan and the Ottoman system reveals a striking similarity; and this is assuredly attributable, not to any mimesis of the society which happened to be prior by the society which happened to be posterior in the accidental sequence of chronology, but rather to a natural conformity between the responses which were made to a virtually identic challenge by two different communities acting independently of, and unbeknown to, one another.³ On the point of similarity, there is, of course, a superficial contrast between the Spartan and the Ottoman achievement in mere material scale. The Spartans succeeded, by means of their 'peculiar institution', in making themselves masters of about two-fifths of the Peloponnese, whereas the entire Morea constituted no more than a fraction of the single Ottoman province of Rumili. Yet, when all the relevant factors, human as well as physical, are taken into account, the Spartan achievement would appear to have been at least as great a *tour de force* as the Ottoman. At any rate, the Spartans were hated quite as intensely as the 'Osmanlis were by their 'human cattle', while

belief that, in his time, the Janissaries were being 'studiously destroyed, . . . so as to be able to lay a foundation of a new discipline', by the policy of the Viziers of the House of Köprülü; and that the War of Candia (A.D. 1645-69) had been prolonged, and the Austrian War of A.D. 1663-4 precipitated, with this purpose in view (Rycaut, op. cit., Bk. III, ch. viii, pp. 197-9).

¹ For Mehmed 'Ali's massacre of the Mamlûks, see p. 31, above. Mehmed 'Ali enticed his victims into the Citadel of Cairo and had them shot down there. Mahmûd's destruction of the sole Ottoman regular forces, such as they were, in 1826, when the Greek Revolutionary War was at its height and a new Russo-Turkish War was in the offing, was a courageous act which was justified by results. For the Ottoman Empire managed to survive the Russo-Turkish War of 1828-9; and thereafter, with the incubus of the old slave-household removed at last, Sultan Mahmûd was able with impunity to call in a Prussian military mission (in which Hellmuth von Moltke won his spurs; see his *Briefe über Zustände und Begebenheiten in der Türkei* (Berlin 1841, Mittler)). By 1843, the Turkish Army had been reorganized on nineteenth-century Western lines. The bombardment of the Janissaries and the shooting-down of the Mamlûks were as brutal as Peter the Great's suppression of the Streltzy. Yet it would be false sentiment to waste pity on these military victims of 'Westernization'. If a watch-dog who is clearly past his work goes mad into the bargain, there is no doubt that he has to be shot, however faithful and efficient he may have been in his day.

² See the passage quoted from Lybyer on p. 33, above.

³ The nature of the Spartan response has been indicated, by anticipation, in vol. i, on p. 24, and vol. ii, p. 48, above.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 51
the numerical ratio of 'human cattle' to 'human watch-dogs' appears to have been as high in Laconia as it was in the Ottoman Empire.¹

When we look into the origins of the Spartan system, we find that the Spartans, like the 'Osmanlis, were confronted with the necessity of performing their *tour de force*, and equipping themselves for the task with their 'peculiar institution', because, at an earlier stage in the course of their history, they had taken a peculiar turning. We have seen that the 'Osmanlis were derived from a band of Nomads which had parted company from the common run of Nomad hordes on the Steppe and had been cast up into the exotic environment of a sedentary society. In a similar fashion, the Spartans parted company, at a certain point in their history, from the common run of Hellenic city-state communities.

The Spartans made a peculiar response to the common challenge which was presented to all Hellenic communities in the eighth century B.C., when, in consequence of the immediately antecedent course of Hellenic social development,² the extension of the area under cultivation in the homelands of the Hellenic Society in Peninsular Greece and in the Archipelago had begun to bring in diminishing returns while the population of Hellas was rapidly increasing in numbers. The 'normal' solution which was found for this common problem of eighth-century Hellenic life was the further extension of the total arable area in Hellenic hands by the discovery and conquest of new territories overseas; and this solution proved satisfactory for two reasons. In the first place, the new lands could be conquered—and held—without an excessive military effort from barbarian 'Natives' who were less efficient than the Hellenic intruders in the art of war; and, in the second place, the lands thus conquered could be made to yield a higher economic return to Hellenic cultivators than they had yielded to their previous occupants because the superiority of the colonists over the 'Natives' in arms was only one manifestation of a superiority all round which extended to other branches of social activity, including agriculture. Even where the 'Natives' were not exterminated by the Hellenic conquerors but were assimilated—partly by force and partly by the attraction of a higher civilization—into the new-comers' body social, there would be room in these new Hellenic colonies overseas, under Hellenic husbandry, for an aggregate increase of population without any lowering of the existing standards of living of the diverse elements from which the population was recruited. This

¹ For an estimate of this ratio in the Ottoman Empire and in Laconia, see Annex III, below.

² The chain of cause and effect which can be detected here is examined further in III. B, on pp. 120-1, below.

was how the borders of the Hellenic World were gradually enlarged, from the eighth to the sixth century B.C., by the creation of new Chalcidian countrysides overseas in the territories of Chalcidian colonies like Leontini or Tauromenium in Sicily or like Methone or Torone in Thrace,¹ or a new Corinthian countryside in the territory of Syracuse, or a new Megarian countryside in the territory of Calchedon.² In the galaxy of new Hellenic city-states that came into existence as a result of this general movement of overseas expansion, there was one foundation, Tarentum, which claimed a Spartan origin; but even if this claim was in accordance with historical fact, the case of Tarentum was unique. Tarentum was the only Hellenic city overseas which even purported to be a Spartan colony; and this Tarentine tradition merely points the truth that, in the main, the Spartans sought to solve the common eighth-century Hellenic population-problem, not along the common lines of overseas colonization, but in their own peculiar way.

When the Spartans found even their broad and fertile ploughlands in the vale of the Eurotas³ too narrow for a growing population, they did not turn their eyes to the sea, like the Chalcidians or Corinthians or Megarians. The sea is not visible either from Sparta city or from any point on the Spartan plain or even from the heights that immediately surround it.⁴ The natural feature which dominates the Spartan landscape is the towering mountain-range of Taygetus, which rises so sheer from the western edge of the plain that its face seems almost perpendicular, while its line is so straight and so continuous that it gives the impression of a wall. This wall-like aspect of Taygetus attracts the eye to the Langádha: a gorge which cleaves the range at right angles as though the titanic architect of plain and mountain had expressly designed this one apparent break in an otherwise uniformly impassable barrier in order to provide his people with a sally-port. When the Spartans began,

¹ For the agricultural colonization overseas which was carried out by the people of Chalcis, and which was typical of a movement in which many other city-states of the Hellenic homeland took part, see I. B (ii), vol. i, p. 24, and II. D (ii), vol. ii, pp. 42-3, above.

² For the relative agricultural value of the Calchedonian and Byzantine territories and the consequent diversity of Calchedonian and Byzantine fortunes, see II. D (ii), vol. ii, pp. 43-8, above.

³ Sparta, which means etymologically 'the sown land', was perhaps the name of the plain which is dominated from the west by the heights of Frankish and Ottoman Mistrà, and from the east by the heights of Minoan Therapne, before the term was confined to denoting the unwallled Hellenic city-state in the midst of the plain which made the name of Sparta famous after Therapne was forgotten and before Mistrà was heard of. (See Toynbee, A. J., in *The Journal of Hellenic Studies*, vol. xxxiii (London 1913, Macmillan), p. 246.) Similarly, Argos meant the arable land dominated by the Minoan fortresses of Mycenae and Midea and Tiryns before it became the name of a Hellenic city-state.

⁴ Between the plain of Sparta and the sea-coast, the River Eurotas has to wind its way through a tangle of hills; and in the panorama of the plain, as seen from the crown of the citadel of Mistrà, it is impossible to detect either the point where the river enters the plain or the point where it leaves it. The plain is shut in by hills in every quarter, as far as the eye can see.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 53
in the eighth century B.C., to feel the pinch of population-pressure, they lifted up their eyes unto the hills¹ and beheld the Langádhā and sought their help in the pass through the mountains, as their neighbours, under the same spur of Necessity, were seeking theirs in the passage over the sea. At this first parting of the ways, help did come to the Spartans from the lord² Apollo of Amyclae and the lady Athana of the Brazen House. The first Messeno-Spartan War (*circa* 736-720 B.C.), which was contemporary with the first Hellenic settlements on the Thracian and Sicilian coasts, left the Spartan victors in possession of broader conquered lands in Hellas than the Chalcidian colonists won overseas at Leontini or the Spartans' own reputed colonists at Tarentum. But the Presiding Genius of Sparta, who led her and who did 'not suffer' her 'foot to be moved'³ when once she had reached her Messenian goal, did not thereby 'preserve' her 'from all evil'.⁴ On the contrary, the superhuman—or inhuman—fixity of Sparta's subsequent posture, like the mythical doom of Lot's wife, was manifestly a curse and not a blessing.

The Spartans' peculiar troubles began as soon as the First Messeno-Spartan War had ended in a Spartan victory; for to conquer the Messenians in war was a less difficult task for the Spartans than to hold them down in peace-time. These conquered Messenians were no barbarous Thracians or Sikels, but Hellenes of like culture, and like passions, with the Spartans themselves: all but their equals in war and perhaps more than their equals in numbers. The First Messeno-Spartan War (*circa* 736-720 B.C.) was child's-play compared to the Second (*circa* 650-620 B.C.), in which the subject Messenians—tempered by adversity and filled with shame and rage at having submitted to a fate by which no other Hellenes had allowed themselves to be overtaken—now rose in arms against their Spartan rulers and fought far harder and longer, in this second bout, to recover their freedom than they had fought in the first bout to preserve it. Their tardy heroism failed, in the end, to avert a second Spartan victory; and, after this unprecedentedly stubborn and exhausting war, the victors treated the vanquished with unprecedented severity. Yet, in the long view of the Gods, the Messenian insurgents had secured their revenge on Sparta, in the sense in which Hannibal was to have his revenge on Rome. The Second Messeno-Spartan War changed the whole rhythm of Spartan life and deflected the whole course of Spartan history. It was one of those wars in which the iron enters into the survivors' souls. It was so terrible an experience that it left Spartan life fast bound in misery and iron, and it 'side-tracked' Spartan evolution into a

⁴ Psalm lxxi. 7.

54 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
blind alley. And since the Spartans were never able to forget what they had gone through, they were never able to relax, and therefore never able to extricate themselves from the impasse of their post-war reaction.

The relations of the Spartans with their human environment in Messenia passed through the same ironic vicissitudes as the relations of the Esquimaux with their physical environment in the Arctic Zone. In either case we have the spectacle of a community which ventures to grapple with an environment that daunts this community's neighbours, in order to wring from this excessively formidable enterprise an exceptionally rich reward. In the first phase, this act of audacity seems to be justified by results. The Esquimaux find better hunting on the Arctic ice than their less adventurous Indian cousins can find on the North American prairies;¹ the Spartans, in the First Messeno-Spartan War, win richer lands from their fellow-Hellenes across the mountains than the contemporary Chalcidian colonists can win from barbarians across the sea. But in the next phase the original—and irrevocable—act of audacity brings its ineluctable penalty. The conquered environment now takes its audacious conqueror captive. The Esquimaux become prisoners of the Arctic climate and have to shape their lives according to its exacting dictates down to the smallest detail.² The Spartans, having conquered Messenia in the First War in order to live unto themselves, are constrained, in the Second War and ever after, to give up their lives to the task of keeping Messenia. They live as the obedient humble servants of their own dominion over Messenia from this time forth for evermore; and this servitude of the Spartiate 'Peers' (*ῥῆμιοι*) is as rigorous a bondage as that of the Ottoman Pādishāh's slave-household (*qullar*).

The Spartans equipped themselves for performing their *tour de force* by the same method as the 'Osmanlis'. They adapted existing institutions to fulfil new needs. But whereas the 'Osmanlis' were able to draw upon the rich social heritage of Nomadism, 'the [latter-day] Spartan institutions are actually built up upon primeval and altogether primitive foundations, which have been adapted with amazing dexterity to the [peculiar] requirements of the Spartan conqueror-state.'³

The Spartans were descended from Greek-speaking barbarians belonging to the so-called 'Dorian' stratum of the external proletariat of the vanished Minoan World: a stratum which had descended upon the shores of the Aegean, out of the European hinterland, in

¹ See the passage quoted from Steensby on p. 4, above.

² See pp. 5-7, above.

³ Nilsson, M. P.: 'Die Grundlagen des spartanischen Lebens', in *Klio* vol. xii (Leipzig 1912, Dieterich), p. 308.

a kind of human avalanche, at the climax of the post-Minoan and pre-Hellenic Völkerwanderung, about the turn of the thirteenth and the twelfth centuries B.C.¹ The primeval institutions which the forefathers of the Spartans had brought with them were the common social heritage of all these 'Dorian' interlopers from the back of beyond; and there were other Hellenic communities of 'Dorian' origin besides the Spartans—e.g. the 'Dorian' conquerors of the heart of the Minoan World in Crete—who retained these primitive institutions down to a late date in Hellenic history. The Cretan 'Dorians', however, seem to have remained socially primitive mainly out of inertia, and to have done little to adapt their inherited social tradition to the conditions of the new social environment in which their conquest of the Minoans had placed them.² On the other hand, the primitive 'Dorian' heritage was sloughed off altogether at an early date by those 'Dorians' who had established themselves on the Isthmus of Corinth and in the Argolid and on the islands and peninsulas off the south-west corner of Anatolia and in other regions which, instead of remaining, like Crete, untouched by the main currents of Hellenic history, became focuses for the development of the new Hellenic Civilization.³ When 'Dorian' Corinth or Sicyon or Rhodes first come into the light of Hellenic history, they display no more trace of primitiveness than contemporary 'Ionic' communities like Athens or Miletus. 'Dorian' Sparta, however, dealt with her primitive heritage in a different manner from either 'Dorian' Crete or 'Dorian' Rhodes.⁴

'The way . . . in which those primitive institutions, which otherwise vanished in all Greek communities before the face of the rising [Hellenic] culture, were made to serve as the corner-stones of the Spartan organism, is something which exacts from us the deepest admiration.'⁵

'In this adaptation, one cannot refuse to discern something which is more than the mere result of an automatic development. The methodical and purposeful way in which everything has been made to lead towards one single goal forces us to see here the intervention of a consciously shaping hand. . . . The existence of one man, or of several men working in the same direction, who have remodelled the primitive institutions into the *Agôgê* and the *Kosmos*, is a necessary hypothesis.'⁶

¹ See I. C (ii) (b), vol. i, pp. 92-3 and 100-1, above.

² For some account of the primitive 'Dorian' institutions as they lingered on in Crete, see Aristotle, *Politics*, Bk. II, ch. vii, 1271 B-1272 B, and Strabo (following Ephorus) Bk. X, pp. 480-4. Compare the survival of Nomadic institutions among the Egyptian Mamlûks. (See pp. 30-1, above.)

³ Compare the disappearance of the original Nomadic institutions of the Magyars after their settlement in Hungary and their subsequent absorption into the body social of Western Christendom.

⁴ For the differentiation in the fortunes of the various Hellenic city-states of 'Dorian' origin in the course of Hellenic history, see II. D (iii), Annex, vol. ii, pp. 395-9, above.

⁵ Nilsson, op. cit., p. 340.

⁶ Nilsson, op. cit., loc. cit.

Hellenic tradition attributed not only the reconstruction of the Lacedaemonian Society after the Second Messeno-Spartan War—a reconstruction which made Sparta what she was and what she remained ever after until she collapsed—but also all the antecedent and less abnormal events in Spartan social and political history to 'Lycurgus'. But 'Lycurgus' was a god;¹ and modern Western scholars, in search for a human author of the 'Lycurgeoan' system, have been inclined to find their man in Chilon, a Spartan Overseer (*ἐφορος*) who left a reputation as a sage and who appears to have held office about 550 B.C.² Perhaps we shall not go far wrong if we regard the 'Lycurgeoan' system as the cumulative work of a series of Spartan statesmen during something like a century, dating from the outbreak of the Second Messeno-Spartan War, on the analogy of the genesis of the Ottoman system, which we know to have been the work of a series of statesmen that began, perhaps, with Sultan 'Osmān himself and ended with Sultan Mehmed the Conqueror.

In the Spartan system, as in the Ottoman, the outstanding feature—the feature which accounts alike for the system's astonishing efficiency and for its fatal rigidity and for its consequent breakdown—was its 'grand disregard for human nature';³ and, when we compare the two systems from this standpoint, we find that while in some respects the 'Lycurgeoan' *agōgē* set human nature at defiance rather less truculently than the Ottoman slave-household, in other ways it challenged it still more provocatively.

The *agōgē* did not go so far as the slave-household in ignoring the customary claims of birth and heredity; and the free citizen landholders of Sparta were in exactly the opposite situation from the free Muslim landed gentry of the Ottoman Empire. Whereas the Ottoman Muslims were excluded from any share in the government of the Empire by rule, and the descendants of the Pādishāh's slaves were debarred from inheriting their fathers' or grandfathers' positions by the practice of conferring upon them the doubtful

¹ 'The famous name of Lycurgus has attracted to itself the whole series of developments that make up Spartan history: *συνουκισμός*, ephorate, rhetra, *γῆς ἀναδασμός*. The Greeks always imagined Athene springing adult out of the head of Zeus: the idea of growth they had not grasped. Accordingly, we find the [Spartan] *νομοθέτης* ascribed to the most varied epochs (which was easy, since he never lived in any generation of men). The ninth century B.C. was the favourite estimate, for this put him well at the back of Spartan history, and it is easier to antedate than to postdate political inventions. But each author connects him with the development that loomed largest in his own mind; and Aristotle, at least (*Politics*, 1270 A, 1-5), dates him after the close of the Messenian Wars.' All the time, 'Lycurgus was a god, or at least the epithet of one. We are surely bound to follow the opinion of the Pythia, even though cautiously expressed (Herodotus, Bk. I, ch. 65). The fact that in Sparta he had a *ναός*, not a *ἱεῖον*, clinches the matter: *Λακεδαιμόνιοι δὲ καὶ Λυκούργῳ τῷ θεμένῳ τοὺς νόμους οἷα δὴ θεῷ ποιῆσαι καὶ τοὺς ἱερὸν*. (Pausanias, *Descriptio Graeciae*, Bk. III, ch. 16, § 6).' Toynbee, *op. cit.*, footnotes on pp. 259 and 256.

² For Chilon, see Guy Dickins in *The Journal of Hellenic Studies*, vol. xxxii (London 1912, Macmillan).

³ See pp. 34 and 44, above.

honour of manumission and enfeoffment, virtually the whole burden of maintaining the Spartan dominion over Messenia was imposed on the free-born children of free-born Spartiates. At the same time, within the Spartiate citizen-body itself, the principle of equality was not only well-established but was carried to great lengths.

Though there was not an equalization of wealth, every Spartiate 'Peer' held from the State one of the fiefs or allotments (κληροί) of equal magnitude—or equal productivity—into which the arable land of Messenia had been divided up after the Second Messeno-Spartan War; and each of these allotments, which was cultivated by the labour of Messenians bound to the soil as serfs (εἰλωτες), was calculated to support a Spartiate 'Peer' and his family, on a 'spartanly' frugal standard of living, without their having to labour with their own hands.¹ Accordingly, every Spartiate 'Peer', however poor, was economically in a position to devote his whole time and energy to the art of war; and since permanent and perpetual military training and service were also incumbent upon every Spartiate 'Peer', however rich he might be, the residual inequality of wealth² was not, at Sparta, reflected in any substantial difference between the rich man's and the poor man's way of life.

In the matter of hereditary rank, the Spartan nobility appear to have retained no political privilege denied to commoners except eligibility to the Council of State (γερονσία). For the rest, they were absorbed into the rank and file of the 'Peers'; and, in particular, the three hundred knights (ἵππεις) of Sparta were no longer, under the 'Lycurgeoan' system, either a club of nobles or a mounted force. They had become a *corps d'élite* of heavy infantrymen which was recruited by merit from all the 'Peers', who competed eagerly for admission.³ The most striking manifestation of the equalitarian spirit of the 'Lycurgeoan' system was the status to which it reduced the Kings.⁴ Though the Kings continued to succeed to the throne by hereditary right, the one substantial power which they retained

¹ The average number of Helot families per Spartiate allotment seems to have been seven (see Herodotus, Bk. IX, ch. 28, § 2). For the amount of the annual rent in kind (that is, in barley, wine, and oil) which a Spartiate 'Peer' was supposed to draw from his allotment, see Plutarch, *Life of Lycurgus*, ch. viii.

² There was a residual inequality of wealth, as between one Spartiate 'Peer' and another, in spite of the equality of the public allotments, because there was private property in land in the older territories of Sparta which had belonged to her before her acquisition of Messenia; and the distribution of this freehold land among Spartan citizens naturally was and remained unequal—in spite of a customary prejudice against the buying and selling even of freehold land, which seems to have grown up by analogy with the non-negotiability of the public allotments (see Heraclides Ponticus, ii. 7, in Müller's *Fragmenta Historicorum Graecorum*, vol. ii, p. 211).

³ See Xenophon, *Respublica Lacedaemoniorum*, ch. iv, and the passage from Plutarch's *Apophthegmata Laconica* which is quoted on p. 65, in footnote 2, below.

⁴ There was a double kingship at Sparta, which was hereditary in two separate dynasties, each of which had to be represented in the person of one of the two kings reigning simultaneously at any given moment.

was the military command on active service. Otherwise, apart from certain ceremonial duties and privileges which were less important than picturesque, the reigning Kings, as well as all other members of the two royal families, had to submit to the same exacting and life-long discipline as ordinary 'Peers'. As heirs apparent, they received the same education; and their succession to the throne brought them no exemption.

Thus, within the fraternity of the Spartiate 'Peers', differences of birth and of hereditary privilege counted, under the 'Lycurgeoan' system, for little or nothing; and, although one normal qualification for admission into this fraternity was free Spartiate birth, no candidates for admission would ever have dreamt of saying—even within themselves, let alone in public—the Spartan equivalent of 'We have Abraham to our father';¹ for Spartiate birth was no guarantee of promotion to the coveted though onerous status of a 'Peer'. Indeed, Spartiate birth, though normally required, was not a *sine qua non*. Spartiate birth simply condemned a child (if it were not reprieved by being rejected as a weakling after birth and put out to die of exposure)² to undergo the ordeal of a Spartan education; and this ordeal merely entitled a boy to compete for a place in the fraternity of the 'Peers' when he came of age. A child's response to this ordeal of education counted for more than his birth in the last resort. There were Spartiates born who failed to give satisfaction under the educational test and who were therefore eventually refused admission to the fraternity of 'Peers' and were left to weep and gnash their teeth in outer darkness in the unenviable status of 'Inferiors'. Conversely, there were cases—though these were evidently rare—in which non-Spartiate boys were allowed to undergo the Spartan education; and if these 'Alien Boys' (μόθακες) acquitted themselves well, they appear to have been no less eligible for enrolment among the 'Peers' than their Spartiate class-mates.³

To this extent the Spartan system, like the Ottoman, ignored the claims of birth and heredity; and there were also points, as has been mentioned by anticipation, in which the God Lycurgus went still farther than the Sultan 'Osmān in defiance of 'human nature'. Whereas, for example, the Ottoman social reformer was content to conscript children who had been born in wedlock in the ordinary way, the Spartan ventured to interfere with marriage itself in the

¹ Matt. iii. 9.

² The new-born child's fate was decided not by its father, as in most Hellenic communities, but by the public authorities (Plutarch, *Life of Lycurgus*, ch. xvi).

³ For these so-called μόθακες, see Phylarchus apud Athenaeum, vi. 271, 2; Plutarch, *Instituta Laconica*, 22; Aelian, *Variae Historiae*, xii. 43. The μόθακες were apparently recruited both from non-Spartan Lacedaemonians (Helots or Perioeci) and from non-Lacedaemonian foreigners. It will be seen that they corresponded in nature as well as in name to the Ottoman 'Ajem-oghians.

interests of eugenics, and sought—with greater audacity but also with greater logic—to do what he could to obtain the kind of human material that he wanted, by breeding, before the time came for selection. In the second place, the Spartan conscription, for the class that was subject to it (that is to say, for all free-born Spartiates who had not been exposed after birth), was universal, whereas the 'Osmanlis only conscripted a portion of the offspring of their 'human cattle' to be trained as 'human watch-dogs', and this every fourth year and in different provinces in rotation. In the third place, the Spartans took the children from their homes and put them into the educational mill at the age of seven; the 'Osmanlis not until the age of twelve and upwards. Finally, the Spartans not only anticipated the 'Osmanlis in conscripting and training girls as well as boys, but they went far farther towards an identical treatment of both sexes. For Spartan girls, as well as for Spartan boys, conscription was universal; and the Spartan girls were not trained in special female accomplishments, nor kept in seclusion from the men, like the girls in the female section of the Ottoman Pādishāh's slave-household. Spartan girls, like Spartan boys, were trained on a competitive system in athletics; and girls, like boys, competed naked in public before a male audience.¹

In the matter of breeding human stock, the Spartan system² pursued two distinct aims simultaneously. It aimed both at quantity and at quality. It secured quantity (proportionately to the miniature scale on which the Spartan Society was built) by addressing itself to the individual male adult Spartiate and seeking to influence his behaviour through inducements and through penalties. The deliberate and confirmed bachelor was penalized by the State and was insulted by his juniors for his shameful lack of public spirit. On the other hand, the father of three sons was exempt from mobilization, and the father of four from all obligations towards the State.³ At the same time, quality was secured by keeping alive, with

¹ This spectacle, which would have routed the most redoubtable Janissary and have given him a lasting moral shock, was really, of course, a demonstration of the remarkable degree of sexual self-control to which, under the 'Lycurgeoan' system, it was possible for the Spartan Society to attain. In this matter, our twentieth-century Western Society is still far from having reached the Spartan level; but that level has been attained, and perhaps surpassed, by the Japanese.

² See Xenophon, *Respublica Lacedaemoniorum*, ch. i; Plutarch, *Life of Lycurgus*, ch. xv; Nilsson, *op. cit.*, pp. 325-35.

³ Aristotle, *Politics*, 1270 B, 1-5. Aristotle points out, in *loc. cit.*, that where, as in Lacedaemon, the number of allotments is limited, large families entail a surplus of pauper male population; but this, of course, was just what the Spartan State required. To meet the incalculable losses of war, Sparta needed a standing reserve of military unemployed. In the Spartiate citizen-body the superfluous souls which, in other Hellenic states, would have been absorbed into industry or commerce, or would have been drawn off by emigration, were first unfitted for either agriculture or any other gainful occupation by being compelled to go through the Spartan military education, and were then retained at home to starve. On the Spartan system, the maintenance of the 'Peers' (*δμοιοι*) entailed the existence of 'Inferiors' (*ὑπομεικτορες*). The Ottoman system showed

a conscious and definite eugenic purpose, certain primitive social customs governing sexual intercourse which appear to have been relics of a sex-group system of social organization antecedent to the system represented by marriage and the family. A Spartiate husband won popular approval, instead of exposing himself to public condemnation, if he took pains to improve the quality of his wife's progeny by arranging that her children should be gotten upon her by a sire who was a better man—or human animal—than her husband himself. And it even appears that a Spartiate wife could arrange this on her own account with impunity if her husband would not take the initiative in providing her with a substitute for himself when he was manifestly below par. The spirit in which the Spartans practised their eugenics is conveyed by Plutarch in a passage¹ which finds its echo in Busbecq's observations, quoted above,² on the social philosophy of the 'Osmanlis. According to Plutarch, the Spartan social reformer

'saw nothing but vulgarity and vanity in the sexual conventions of the rest of Mankind, who take care to serve their bitches and their mares with the best sires that they can manage to borrow or hire, yet lock their women up and keep them under watch and ward in order to make sure that they shall bear children exclusively to their husbands—as though this were a husband's sacred right even if he happens to be feeble-minded or senile or diseased. This convention ignores the two obvious truths that bad parents produce bad children and good parents good children, and that the first people to feel the difference will be those who possess the children and who have to bring them up.'

In the matter of educating³ the Spartiate children which had been bred in this way, with the ultimate object of selecting the best of them for enrolment among the 'Peers' and endowment with public allotments, the Spartan system again availed itself of the relics of a pre-familial system of social organization in which the child who no longer needed his mother's personal care was educated, not by learning his father's business in a patriarchal household, but by successive membership in a series of 'human packs', in which he consorted, at each stage, with the other children of the tribe who were of his own age and sex. The 'Lycurgean' reform adopted this

itself more statesmanlike, as well as more humane, in taking care that every child which passed through it should learn a trade besides receiving the literary and athletic education required for making administrators and soldiers, and further in arranging thereafter that the adult *'Ajem-oghians*, who were on the waiting-list for admission to the Janissary Corps and who had to be kept in waiting in order to maintain the necessary military reserve, should be enabled meanwhile to earn their livings in some public or private employment.

¹ Plutarch, *Life of Lycurgus*, ch. xv.

² See p. 42 above.

³ For the Spartan education, see Xenophon, *Respublica Lacedaemoniorum*, chs. ii and iv; Plutarch, *Life of Lycurgus*, chs. xvi and xvii; Nilsson, *op. cit.*, pp. 309-25 ('Altersklassen und Syskenien'); Toynbee, *op. cit.*, pp. 261-2.

'age-class' system and at the same time adapted it to its own educational purpose by introducing a cross-division in which children of all ages were brought together in one group, so that the elder children might assist in training the younger.¹ These juvenile 'droves' (*ἀγέλαι*) were reproductions of, and preparations for, the adult 'messes' (*φιδίτια*), which were associations of 'Peers' belonging to different 'age-classes', from the highest to the lowest, among the forty 'year-classes' (from the twenty-first to the sixtieth year inclusive) that were subject to military service.² The climax of a Spartan boy's thirteen years of education in a 'drove' was his candidature, at the end of his twentieth year, for entry into one of the 'messes', which was the sole avenue of admission into the fraternity of the 'Peers'. Entry into a 'mess' could only be secured by co-option; and a single 'black ball' entailed the rejection of the candidate.³ A successful candidate, once co-opted, remained an active member of his 'mess' for forty years unless he either failed to make his prescribed contribution, in victuals and money, towards the

¹ For this cross-division (a Spartan innovation upon the primitive 'Dorian' institutions, as is indicated by the fact that there is no trace of it in 'Dorian' Crete), see Nilsson, *op. cit.*, pp. 323-4. The 'age-classes' at Sparta were called 'herds' (*βοῦαι*), the cross-divisions 'droves' (*ἀγέλαι*) and 'hordes' (*ἵλας*). These vertical cross-divisions, which included boys of all ages, evidently played a more important part than the 'age-classes' in the life and education of a Spartiate boy. In the 'drove' the junior boys were under the authority of one of the senior boys who was appointed 'horde-leader' (*ἡδραρχος*) and who had much the same duties of exercising discipline and rights of exacting 'fagging' from his juniors as a 'prefect' in an English 'public school'. (The 'prefect system' also existed in the Ottoman chambers of *Ajem-Oghlans*: see Withers, R.: *Description of the Grand Signor's Court* (London 1650, Martin and Ridley), pp. 65-7.) To supervise the education of the 'fags' by the 'prefects' in the 'droves' and 'hordes' was the informal business of every Spartiate 'Peer' and the official business of the Director of Public Education (*παιδονόμος*)—an office which, at Sparta, was a step to the highest political career (Xenophon, *Respublica Lacedaemoniorum*, ch. ii). Though Spartan boys, like Ottoman *Ajem-oghans*, were taught to read and write (Plutarch, *Life of Lycurgus*, ch. xvi), their education was otherwise almost exclusively moral and physical. There was no counterpart, in the Spartan system, to the literary education that was given to the Ottoman *Ich-oghans*, in spite of the fact that Sparta lay in the midst of a Hellenic World whose posthumous fame rests to-day upon the higher intellectual education which it evolved. In this most un-Hellenic trait, Sparta showed that, in accepting the 'Lycurean' system, she had sold her birthright. Thenceforward, Sparta was in Hellas but not of it.

² For this institution, see Xenophon, *Respublica Lacedaemoniorum*, ch. v. The Spartan name for a 'mess' was *φιδίτιον* and for mess-mates *σώκηνος* ('occupants of the same tent'). In popular Greek parlance, the Spartiate mess was called a *συσσίτιον*; a word which bears its meaning on its face. The 'mess' was the basis, but not the unit, of the military formation. The smallest Spartan military unit, which was called the 'company' of sworn comrades (*ἐνομορία* = *Eidgenossenschaft*), was apparently a body of 40 men representing the 40 'year-classes' subject to service; and each of these 'companies' seems to have been made up of 2 'messes'. After the reorganization of the Lacedaemonian Army in the fifth century B.C. (see Annex III, below), when the proportion of Spartiates to Perioeci was reduced from 5:5 to 4:6, the 2 Spartiate 'messes' in each Spartiate 'company' appear to have contained no more than 16 men each, the complement of 8 additional men, which was needed to bring the 'company' up to its full strength of 40, being now provided by the Perioeci. Under this organization, the 40 adult 'year-classes' were presumably consolidated into 8 blocks of 5 'year-classes' each, so that, in every 5 years, each of the 2 'messes' in a 'company' would liberate 2 time-expired men and replace them by 2 recruits, while there would be 1 replacement among the supplementary Perioeci. (See Toynbee, *op. cit.*, pp. 261, 264, and 267.)

³ Plutarch, *Life of Lycurgus*, ch. xii.

62 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
upkeep of the common table or were convicted of the unpardonable offence of cowardice in war.¹

The leading features in the Spartan system were the same as in the Ottoman²—namely: supervision, selection, and specialization; a competitive spirit;³ and the simultaneous use of the negative stimulus of punishment and the positive stimulus of reward. And in the Spartiate fraternity of 'Peers', as in the Ottoman slave-household, these features were not confined to the educational stage. They continued to dominate the Spartiate's adult life as they had dominated his boyhood; and from the moment when he was taken away from his mother upon the completion of his seventh year he was continuously subject to discipline until the completion of his sixtieth year brought him his release from military service. The outward and visible sign of this discipline was the regulation which prescribed fifty-three years 'service with the colours'; for the Spartiate who had been transferred as a child from his parents' home to a juvenile 'drove' did not find himself at liberty to live in a home of his own when he had been co-opted into a 'mess' and had been endowed with a public allotment and had performed his social duty of taking a wife in marriage. Whereas the Janissaries, who were discouraged from marrying, were allowed to live in married quarters if they did marry nevertheless, the Spartiate 'Peers' were both compelled to marry and forbidden to lead a 'home life'.⁴ The Spartiate bridegroom was required to spend even his wedding-night in barracks; and though the ban upon sleeping at home was gradually relaxed as he advanced in years, the ban upon dining at home was absolute and permanent.

Lycurgus took care that the Spartiates should not be at liberty to take a preliminary dinner at home and so come to mess on full stomachs. If a Spartiate showed no appetite at mess, he was "told off" by his messmates as a glutton who was too soft to stand the common fare; and if he was actually convicted he was fined. There was a famous occasion when King Agis had returned from the wars after a long absence (at the end of his victorious war of attrition against Athens). The King wanted to dine, just once, with his wife, and sent to the mess for his portion; but the Army Council (οἱ πολέμαρχοι) would not allow it to be

¹ See Herodotus, Bk. VII, ch. 231; Xenophon, *Respublica Lacedaemoniorum*, ch. ix. There is a similarity in organization and in atmosphere between a Spartan 'mess' and a Janissary 'mess' (as described above in the passage quoted from Busbecq on pp. 38-9). The Janissaries, like the Spartiates, were even famous—or notorious—for their soup; and the senior member of a Janissary 'mess' was called the *chorbaji* ('soup-maker'). The recognized method by which the Janissaries expressed dissatisfaction was to upset their soup-kettles—a gesture which was taken as a danger-signal by any wise Pādīshāh. At Sparta, though the soup was no more palatable, such insubordination was unheard of!

² See p. 36, above.

³ See Xenophon, *Respublica Lacedaemoniorum*, chs. iv and x.

⁴ Compare the attitude of Oxford colleges, with their monastic tradition, towards married 'fellows'.

sent, and when the incident came to the notice of the Board of Overseers (*τοῖς ἐφόροις*) next day, they made the King pay a fine.¹

Manifestly, a system which set 'human nature' at defiance so truculently as this could not have been enforced without some overwhelming external sanction; and at Sparta this sanction was applied by public opinion, which knew how to chastise an offender against the Spartan social code with scorpions that stung far more cruelly than the Overseers' whips. The point is brought out by an Athenian observer² who studied the Spartan system in its eleventh hour, on the eve of its collapse.

'One of the remarkable achievements of Lycurgus is that he has made it preferable, in Sparta, to die a noble death rather than remain alive in disgrace. As a matter of fact, investigation reveals that there are actually fewer deaths in battle among the Spartans than in armies which give way to their fear and prefer to leave the field; so that in reality courage turns out to be a more effective survival-factor than cowardice. The path of courage is easier and more agreeable and smoother and more secure. . . . And I ought not to omit to explain how Lycurgus made sure that this path should be followed by his Spartans. He made sure of that by ensuring inevitable happiness for the brave and inevitable unhappiness for the cowardly. In other communities, a coward's only penalty is to be branded with the epithet. For the rest, he is free to work and play cheek by jowl with men of valour if he chooses. In Sparta, on the other hand, everybody would be ashamed to take a coward for his messmate or to take him for his partner in athletics. And it will often happen that when they are picking up ball-teams the coward finds himself left out, and that in choirs he is pushed out into the least honourable positions, and that he has to yield precedence to everybody in the street and at table and to make way for his juniors and to keep his womenfolk indoors and to bear their reproaches for his lack of manhood and to resign himself to having no housewife in his house and to pay a fine on that account into the bargain, and never to show himself out of doors with his skin oiled, and in fact to do nothing whatsoever that is done by Spartans who have no stain on their reputations—under pain of receiving bodily chastisement from his betters. For my part, I am not at all surprised that, in a community in which cowardice is visited with this terrific penalization, death is preferable to a life of such reproach and such dishonour.'³

¹ Plutarch: *Apophthegmata Laconica*; *Lycurgus*, No. 6.

² Xenophon, *Respublica Lacadaemoniorum*, ch. ix.

³ These penetrating general observations on the potency of public opinion in keeping the Spartan system in force are borne out by a particular case in point which is recorded by Herodotus (Bk. VII, chs. 229-31 and Bk. IX, ch. 71) as a foil to the story of Leonidas and his Three Hundred at Thermopylae in 480 B.C. Two of the Three Hundred, Eurystus and Aristodamus, were in hospital with acute ophthalmia at a village a few miles behind the front, when they received the news that Leonidas' flank had been turned and that their comrades' duty of holding the pass had become a forlorn hope. At this news, Eurystus groped his way back to the front and fell in action with the two hundred and ninety eight, whereas Aristodamus went home.

'The fact . . . that one of them had actually met his death, while the other, who had

Yet penalization alone, however merciless, could never have created the Spartan *êthos* or have inspired the superhuman heroism which that *êthos* made possible. The sanction which made the Spartans what they were was internal as well as external; for these implacable souls, whose corporate public opinion made life intolerable for any one of their number who had failed to live up to their common standard of behaviour, were merciless in such cases just because they were single-hearted in exacting the same standard individually from themselves. This 'categorical imperative', in the soul of every true Spartiate 'Peer', was the ultimate driving force which made the 'Lycurgeoan' system work—in sheer defiance of 'human nature'—for more than two hundred years. And its essence is laid bare in the no doubt imaginary but none the less illuminating conversation which Herodotus¹ puts into the mouths of the Achaemenian Pādishāh Xerxes and the exiled Spartan King Dāmarātus, who was serving on Xerxes' staff, when Xerxes' army was marching upon Thermopylae from the Dardanelles. Xerxes has asked Dāmarātus whether he is to expect any resistance; and Dāmarātus has answered him that, whatever the other Hellenes may do, he can guarantee in regard to his own Spartan countrymen (though he personally has no cause to love them) that they will turn out to

the same excuse (neither better nor worse) to cling to, had not made up his mind to lose his life, compelled the Spartans to be implacable in visiting their resentment upon Aristodāmus. . . . After returning to Lacedaemon, Aristodāmus was received with insult and contumely. The contumely took the practical form that no Spartan would give him a light for his fire or speak to him, while he was insulted with the nickname of "Runaway Aristodāmus" (*Ἀριστοδάμῳς ὁ τρέσας*). At the Battle of Plataea, however, he made good all the imputations upon his character. . . . At the Battle of Plataea, Aristodāmus . . . was the Spartan who showed by far the greatest gallantry in my judgement. Next to him, the Spartans Poseidonius, Philocyon, and Amompharētōs distinguished themselves most conspicuously. On the other hand, in a discussion as to which of them had shown the greatest gallantry, the Spartans present came to the conclusion that the prodigies of valour performed by Aristodāmus, who behaved like a man possessed and would not keep his place in the ranks, were inspired by his unconcealed wish to die on account of the imputation under which he laboured, while Poseidonius had fought like a hero without any desire to lose his life—a factor which, in their judgement, gave the measure of his superiority. This pronouncement might conceivably have been dictated by envy; but the fact remains that all the individuals whom I have mentioned who fell in this battle, with the exception of Aristodāmus, were awarded honours, while Aristodāmus, who wished to die on account of the imputation aforementioned, received none.'

Herodotus also mentions (in Bk. VII, ch. 232) another case which, if true, was even more inhuman than the treatment of Aristodāmus:

'There is also said to have been another survivor of the Three Hundred named Pantitās, who had been sent with dispatches to Thessaly and who returned to Sparta, was treated with contumely and committed suicide.'

This militant and merciless pressure of Spartiate public opinion, to which the individual Spartiate was subject, was perhaps the most odious feature of Spartan life in Athenian eyes, and it is tacitly stigmatized, by implication, in the following passage from the funeral oration delivered by Pericles on the Athenians who fell in the first campaign of the Atheno-Peloponnesian War of 431-404 B.C., as reported by Thucydides (Bk. II, chs. 34-46):

'We [Athenians] lead a life of freedom not only in our politics but in our mutual tolerance of private conduct. We do not resent our neighbour doing what he pleases, nor subject him to those marks of disapproval which poison pleasure though they may inflict no formal injury.'

¹ Herodotus, Bk. VII, chs. 101-5.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 65
fight without taking any account of the disparity of numbers. When Xerxes refuses to entertain the idea that troops who are free agents, as the Spartans are *ex hypothesi*, would voluntarily face an ordeal into which Xerxes' own troops could only be driven by dread of their commander and by compulsion of the lash, Dāmarātus replies that,

'free though the Spartans are, they are not free altogether. They too serve a master in the shape of Law, whom they dread far more intensely than your servants dread you. They show this by doing whatever their master orders, and his orders are always the same: "In action it is forbidden to retire in the face of enemy forces of whatever strength. Troops are to keep their formation and to conquer or die."'

This was the spirit that inspired the Spartans' achievements; and those achievements have stamped the Spartan name with the meaning which it still bears in every living language to-day. The deeds are so famous that there is no need in this place to retell familiar tales. The story of Leonidas and the Three Hundred at Thermopylae: is it not written in the Seventh Book of Herodotus? And the story of the Boy and the Fox: is it not written in Plutarch's *Life of Lycurgus*?¹ And do not these two stories, between them, convey the whole *tour de force* of Spartan boyhood and Spartan manhood?² And if we cannot take our eyes off the Spartans—as, in candour, we cannot—without first looking also at the other side of the Spartan shield, we have simply to remind ourselves that the last two years of a Spartan boy's education before his coming of age—the crucial years upon which, more than any others, his prospects of co-option on to a 'mess' depended—were probably spent in the Secret Service (*κρυπτεία*), and that this was nothing else than an official 'murder gang' which patrolled the Laconian countryside surreptitiously—taking cover by day and stalking abroad, like a veritable *negotium perambulans in tenebris*,³ by night—for the purpose of making away with any Helots who had shown symptoms of restiveness or perhaps

¹ It was part of the education of Spartan boys that they were ordered to steal and were punished if caught. 'And to show what earnestness the boys put into their stealing I will cite the story of the boy who, once upon a time, had stolen a fox and was hiding it under his shirt; and although the creature was tearing the boy's belly with its teeth and claws the boy bore the torture, rather than be found out, until he fell down dead.' (Plutarch, *Life of Lycurgus*, ch. xviii).

² If one other touch is still needed in order to complete this bright side of the picture, it will be given by the following rather less well-known anecdote, which illustrates the triumph of public spirit over personal ambition (though ambition was deliberately fostered by the competitive spirit of the 'Lycurgean' system):

The Spartiate Paedarātus went off in high spirits, with a smile on his face, after having been passed over as a candidate for enrolment in the Three Hundred (the highest distinction attainable at Sparta). The Overseers (*οἱ ἑπόροι*) called him back and asked him why he was laughing. "I am laughing", he said, "because I am so delighted at Sparta's good fortune in having three hundred citizens who are better men than I am." (Plutarch: *Apophthegmata Laconica*, Paedarātus, No. 3 (cf. *Lycurgi Vitam*, ch. xxv).)

³ Psalm xci. 6.

merely vestiges of character and ability.¹ While Sparta demanded, and duly evoked, the manly heroism of a Leonidas and his Three Hundred in order to cover the Spartan name with incomparable military glory, she equally demanded—and did not fail to evoke—the juvenile criminality of her Secret Service in order that the tiny minority of Spartiate ‘Peers’ might keep their feet on the necks of a numerically overwhelming majority of ‘Inferiors’ and ‘Dependants’ and ‘New Members’ and ‘Serfs’ who would have been delighted, if ever they had the chance, ‘to eat’ their handful of masters ‘alive’.² If, under the ‘Lycurgeoan’ system, the Spartans rose to some of the sublimest heights of human conduct, they also sounded some of the darkest depths.

Every feature in the ‘Lycurgeoan’ system—material or spiritual, evil or good—was directed towards one single aim; and this definite aim was exactly achieved. Under the ‘Lycurgeoan’ system, the Lacedaemonian heavy infantry were the best heavy infantry in the Hellenic World. They were as far superior to any other Hellenic troops of the same arm as the Janissaries were superior to the infantry of Western Christendom in Busbecq’s day. For nearly two centuries the armies of other Hellenic Powers dreaded to meet the Lacedaemonian Army in pitched battle. In drill and in *moral* alike, the Lacedaemonians were inimitable. But, just because of this, there was no room, in ‘Lycurgeoan’ Sparta, for more than one kind of professionalism.

The ‘single-track’ genius of the ‘Lycurgeoan’ *agôgê* leaps to the eye of any visitor to the present-day Sparta Museum. For this museum is totally unlike any other modern collection of extant Hellenic

¹ This Spartan Secret Service may be compared with the patrols which used to terrorize the Negro population in the Southern States of the North American Union before the abolition of slavery. The *chef d’œuvre* among the recorded villainies of the Spartan Secret Service was the assassination of the Helots who had responded to a call for volunteers which the Spartan Government had made in the Great Atheno-Peloponnesian War of 431–404 B.C. The story is recorded by a witness of enemy nationality; but since this witness happens to be Thucydides, we can accept the anecdote, nevertheless, without a very heavy discount.

“The whole policy of the Spartans towards the Helots is governed by considerations of security; and one of the acts into which they were led by their fear of the rising generation’s spirit and numbers was the following. They proclaimed that all Helots who could show a distinguished war record should present themselves for selection to receive their freedom. This was simply a trap—the calculation being that those Helots who considered that they had the best claim to liberation would be just the Helots who would have the spirit to take the initiative in falling upon their masters. So they selected two thousand of them; and these two thousand gave thanksgiving for their manumission by crowning themselves with garlands and visiting the shrines of the Gods in procession. But the Spartans were not long in making away with them—and this with such secrecy that nobody ever knew how each of the victims had met his end.” (Thucydides, Bk. IV, ch. 80.)

The extermination of the 2,000 does not seem to have been complete (see Toynbee, op. cit., footnote on p. 266); but, even so, the story is black enough. For the general treatment of the Helots, see Plutarch’s *Life of Lycurgus*, ch. xxviii. For the policy of compelling the Helots to make buffoons of themselves, see II. D (vi), vol. ii, p. 233, footnote 4, above.

² See Annex III, below.

works of art, either in Greece or elsewhere. In other such collections the visitor's eye seeks out and finds and dwells upon the works of 'the Classical Age', which approximately coincides with the fifth and fourth centuries B.C. In the Sparta Museum, however, this 'Classical' Hellenic art is conspicuous by its absence. The visitor's eye is here caught first, and fascinated, by the 'pre-classical' exhibits: delicate ivory-carving and striking polychrome pottery painted by artists who had a gift for line as well as colour. Fragmentary though they are, these relics of early Spartan art bear unmistakable marks of originality and individuality; and the visitor who has made the discovery of them here for the first time looks expectantly to find the sequel—only to look in vain, since this early blossoming of Spartan art remains a promise without a fulfilment. In the place which should contain the monuments of a Spartan version of 'Classical' art there is a great hiatus; and the Sparta Museum contains little more except a superfluity of uninspired and standardized works of minor sculpture dating from the late Hellenistic and early Imperial period. Between the two sets of exhibits in the Sparta Museum a great chronological gulf is fixed; and this gulf is explained by the dates. The date at which the early Spartan art breaks off is approximately that of the Overseership of Chilon in the middle of the sixth century B.C. The almost equally abrupt resumption of 'artistic production' in the age of decadence is posterior to 189–8 B.C.: the date at which the 'Lycurgeoan' system is known to have been abolished at Sparta by the deliberate policy of a foreign conqueror after Sparta had been forcibly incorporated into the Achaean League.¹ Art was impossible at Sparta so long as Spartan life was confined, by this cast-iron system, to the single track of militarism.

The paralysis which descended, with the *agôgê*, upon Spartan pictorial and glyptic art was equally fatal to the art of music,² in which the Spartans had likewise shown early promise. The Spartan authorities even discouraged their nationals from cultivating an art which is so near akin to the soldier's that, in our modern Western World, it is regarded as the best preparation for a military training. The Spartans were prohibited from competing in the

¹ For the conquest and incorporation of Sparta into the Achaean League in 189 B.C. and the deliberate eradication of the 'Lycurgeoan' system by the Achaean authorities, see Polybius, Bk. XXII, ch. 11, 5–12, *fin.*; and Livy, Bk. XXXVIII, ch. 34.

² 'At Sparta, any departure from the primitive canons of music was censored. Terpander himself, who was a primitive of primitives and the best harpist of his day and a eulogist of heroism, was fined, all the same, by the Overseers (*ἐφόροι*), and had his harp permanently confiscated by them, because he had added just one extra string in order to increase the instrument's range. The Overseers only approved of simple melodies. Again, when Timotheus was competing at the festival of the Carneia, one of the Overseers snatched up a knife and asked the performer on which side of his instrument he (the Overseer) was to cut the necessary number of strings in order to bring the total down to the permitted number of seven.' (Plutarch: *Instituta Laconica*, No. 17.)

great Pan-Hellenic athletic sports,¹ on the ground that professionalism in running and jumping and putting the weight was one thing and professionalism in wielding the spear and the shield and performing the evolutions of the parade-ground was something quite different, from which the Spartiate's heart and mind must not be distracted on any account.²

Thus Sparta paid the penalty for having taken her own headstrong and hazardous course at the parting of the ways in the eighth century B.C. by condemning herself, in the sixth century, to standing still—with arms presented like a soldier on parade—at a moment when other Hellenes were just moving forward once again on one of the most signal moves in the whole course of Hellenic history.

It requires an effort of imagination to remind ourselves that the fraternity of Spartiate 'Peers' was the earliest Hellenic democracy, and that the redivision of the arable land of Messenia among the members of this Spartiate *dêmos* in equal allotments became the watchword—*γῆς ἀναδασμός*—of the revolution that convulsed Athens in the next generation. In Sparta the new movement which had declared itself precociously in the 'Lycurgeoan' reform was doomed to be arrested prematurely at a rudimentary stage because the 'Lycurgeoan' system changed the face of Spartan life, only to petrify it for ever after. It was not in Sparta, and not in response to the peculiar challenge that had been presented to the Spartans in the Second Messeno-Spartan War, that these new tendencies in Hellenic life were destined to work themselves out in fresh acts of creation. The creative act of the sixth century B.C. was evoked by a challenge of a different kind; and this challenge was presented in the first instance to those Hellenic communities which had responded to the previous challenge of the eighth century, not on the Spartan lines of conquering a next-door neighbour in Hellas, but on the Chalcidian and Megarian lines of overseas colonization.

After the Malthusian problem had been solved—or shelved—in Hellas at large by this method for a period of some two centuries, it was raised again, and this time more acutely than before, by the simultaneous stoppage of the territorial expansion of the Hellenic World in every quarter.³ Eastward, Hellenic expansion was checked in the sixth century B.C. by the rise of new Great Powers—the Saite Power in Egypt and the Lydian in Anatolia and the far

¹ This prohibition did not apply to Spartan women—if they were wealthy enough to compete vicariously by entering a chariot for the chariot-races.

² Compare the official discouragement, and even prohibition, of golf and tennis, in the supposed interests of cricket, in certain English 'public schools' at the present day; and contrast the *mot*, attributed to the Duke of Wellington, that 'the Battle of Waterloo was won on the playing-fields of Eton'.

³ For this stoppage, see further III. B, pp. 121-2; III. C (i) (a), pp. 139-40; and III. C (i) (d), pp. 197-8, below.

mightier Achaemenian Empire that first overshadowed and then absorbed them both. During the same century, Hellenic expansion was brought to a halt in the Western Mediterranean by a rally among the rival Levantine colonial peoples—Phoenicians and Etruscans—who now discovered in political co-operation a make-weight for their inferiority to the Greeks in vitality and in numbers. At the same time the indigenous barbarians of the West were beginning to learn how to hold their own against all the Levantine intruders alike by fighting them with their own weapons. In these various ways the expansion of Hellas was cut short all round; and this challenge stimulated the Hellenes to solve their recurrent social problem by substituting, for the mere extensive growth which was no longer open to them, an intensive growth, of a higher social order, which was still within their capacity. They passed from 'subsistence farming' to 'cash-crop farming' and manufactures; from a régime of local self-sufficiency to a régime of international trade; from a natural economy to a money economy; and from a polity based on birth to a polity based on property. And the lead in making this victorious response was taken by Athens: a 'dark horse' who had not taken part in the earlier movement of overseas colonization, but who at the same time had not followed Sparta into her Messenian blind-alley.

The nature of the Athenian response has been examined already in this Study elsewhere in another connexion.¹ In this place it has only to be mentioned in order to point the contrast between Hellenic progress under Athenian leadership and Sparta's un-Hellenic immobility; and this contrast is aptly symbolized in the difference between the Attic and the Spartan money-coinage. The new invention of coined money had found its way into Sparta before the 'Lycurgeoan' system set hard; and even thereafter it continued to play a not unimportant part in the internal life of the fraternity of Spartiate 'Peers', since a 'Peer's' contribution to his 'mess', which he had to keep up under pain of forfeiting his membership, was payable partly in money as well as in kind. Yet although the sixth-century Spartan reformers could not, or would not, banish coin from Laconia altogether, they succeeded in adapting this institution to their purpose like all the other institutions which they found in the field. They allowed their countrymen to retain a token-currency of iron which was too heavy and bulky for ordinary convenience and was chemically treated in such a way as to make it too poor in quality to have any intrinsic commercial value even in bulk.² Thus

¹ See I. B (ii), vol. i, pp. 24-5, and II. D (ii), vol. ii, pp. 39-42, above.

² Plutarch, *Life of Lysander*, ch. xvii. Plutarch goes on to point out that the Spartan Government was merely preserving, at Sparta, the primitive type of coinage that had once been prevalent everywhere.

Laconia was excluded from the international continuum of financial relations, just as effectively as if she had possessed no coinage at all, by being given a coinage which could have no currency beyond the Laconian frontiers. Meanwhile 'the owls of Athene' became the current coin of the entire Mediterranean World, and the occasional arrival of a flock of these migratory birds in Sparta itself created still greater consternation among the Spartan authorities than the importation of a musical instrument with more than seven strings.¹ The Spartiate Gylippus himself, who had done perhaps as much as any other single man to bring Athens to the ground in the Great War of 431-404 B.C. by foiling the Athenian attempt to conquer Sicily, was forced to go into exile on the morrow of the peace when his servant laid information that there was 'a bevy of owls in the tiliary'.²

Thus the 'Lycurgeoan' system, which the Spartans established in order to defend their dominion over the Helots at home, had the effect of throwing them on the defensive against the whole Hellenic World into the bargain. And the greatest irony in Sparta's situation was the fact that, when she had sacrificed everything that made life worth living to the single object of forging an irresistible military instrument, she found that she dared not make use of her dearly bought power because her social equilibrium under the 'Lycurgeoan' system was so exact, and her social tension so high, that the slightest disturbance of the *status quo* might have disastrous repercussions; and this disaster might be brought on by a victory which would increase the permanent demands on Sparta's manpower almost as readily as by a defeat which would open the way for an invasion of Sparta's home-territories. In the event, the fatal victory of 404 B.C. and the consequent fatal defeat of the year 371 duly brought upon the Spartans the disaster which they had never ceased to dread since they had succeeded in making themselves into the most formidable military power in their world. Yet Spartan statesmanship managed to postpone the evil day for nearly two centuries, dating from the completion of the 'Lycurgeoan' reforms, by declining to accept for Sparta the greatness which circumstances incessantly sought to thrust upon her.

In this frame of mind the Spartans evaded, time and again, the challenge to assume the leadership of Hellas which the Achaemenian peril presented to them. They forbore to send help to the Anatolian Greek insurgents in 499 B.C.; they arrived too late to fight at Marathon in 490; and after covering themselves with glory, under protest, at Thermopylae and Plataea, they abdicated from

¹ See the passage quoted from Plutarch on p. 67, footnote 2, above.

² Plutarch, *Life of Lysander*, ch. xvi.

the high command of the forces of liberation in 479-478. Rather than incur the risks which greatness involved for Sparta, they deliberately left their own repudiated greatness lying derelict for Athens to appropriate; and yet, even at this bitter price, they were ultimately unable to elude their tragic destiny. For the Spartans' great refusal to accept the challenge of 499-479 B.C. did not, and could not, purchase for Sparta more than a brief immunity from her peculiar dilemma. In preferring, to the risks of acceptance, the lesser immediate evil of giving the Athenians their opportunity, the Spartans were opening the door for the menace to Hellenic liberties to recur in the shape of an Athenian peril; and this time the Spartans found themselves confronted with a challenge which it was impossible for them to ignore. In the opinion of Thucydides, 'the fundamental . . . cause of the Atheno-Peloponnesian War was the fear inspired in the Lacedaemonians by the rise of Athens to greatness; and this fear compelled them to take up arms'¹—under threat of seeing the 'sanitary cordon' of their Peloponnesian alliance dissolve and their Athenian enemy from beyond the Isthmus join hands, to their undoing, with their Messenian enemy within their gates.

In 431 B.C. Corinthian diplomacy succeeded in compelling Spartan statesmanship to assume the leadership of Hellas at last; and, in the Great War of 431-404, the Spartan military machine—now tested for the first time to the uttermost—performed all that its makers had intended, and all that Sparta's neighbours hoped or feared. The Spartan nightmare of an *union sacrée* between Athens and the Helots did not come true—not even when the Athenian strategist Demosthenes made his brilliant stroke of establishing a fortified post at Pylos, on the Messenian coast of Laconia, in 425 B.C. On the other hand, the overland expedition of the Spartan commander Brasidas to the Thracian seaboard, and the exhaustion of Athenian strength in Nicias' naval expedition to Sicily, did bring to pass the Athenian nightmare that the Peloponnesians might succeed in joining hands with the Hellenic subjects of Athens on the other side of the Aegean, and might overpower Athens on her own element with a fleet manned by Ionian seamen and financed by Achaemenian gold. When this first stage in the self-inflicted attrition of the Hellenic Society came to an end in the year 404 B.C., it was Athens and not Sparta that lay prostrate. Yet the Spartan King Agis' prophecy—uttered at the moment when the die was cast—that 'this day' would prove to 'be the beginning of great evils for Hellas'² came true in respect of the victors no less than the vanquished; for the greatness which Sparta now tardily and

¹ Thucydides, Bk. I, ch. 23.

² Ibid., Bk. II, ch. 13.

72 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
involuntarily retrieved from her prostrated rival proved to be a veritable Shirt of Nessus.

The Spartans were placed in the same predicament by their victorious war of 431-404 B.C. as the 'Osmanlis by their disastrous war of A.D. 1682-99. A people trained consummately but exclusively for warlike contact with its neighbours found itself suddenly compelled, by the outcome of one particular war, to enter into non-military relations for which they were not only unprepared but were positively unfitted by their own peculiar institutions and habits and *éthos*. These peculiarities which the Spartans, like the 'Osmanlis, had developed in order to grapple with a previous problem, and which had given them superhuman strength within the limits of the narrow environment within which their lines had previously been cast, now took their revenge upon this peculiar people by making them inhumanly or infra-humanly incompetent to live in the wider world into which the fortunes of war had eventually carried them. The very exactness of their adaptation to their previous environment made any readaptation to a new environment so difficult for them as to be virtually impossible; and the very qualities which had been the secret of their success in the one situation became their worst enemies when they found themselves in the other. For these selfsame reasons the 'Osmanlis came to grief when, in consequence of a military defeat, they had to negotiate diplomatically with the Powers of Western Christendom instead of simply imposing their will upon them;¹ and the Spartans came to grief when, in consequence of a military victory, they had to take upon their own shoulders the imperial responsibilities of Athens instead of merely holding the naval and military power of Athens at bay.

The contrast between the Spartan at home and the Spartan abroad was a by-word in Hellas; for whereas, on his own ground, the Spartan admittedly rose above the ordinary Hellenic standards of personal discipline and disinterestedness, he fell below those same standards in at least equal measure as soon as he found himself out of his own element.² The spectacular demoralization of

¹ In A.D. 1793, under the stimulus of the shock which had been administered by the disastrous outcome of the Russo-Turkish War of 1768-74, the Westernizing Sultan Selim III took the new departure of establishing permanent Ottoman diplomatic missions in Paris, Vienna, London, and Berlin. It proved impossible, however, to find competent 'Osmanlis to play the Western-style ambassadorial role, and the original appointees, who were naturally Turkish Muslims recruited from the Ottoman dominant minority, had to be replaced by Greek Christian *chargés d'affaires* recruited from the *ra'iyyeh* (d'Ohsson, I. M.: *Tableau Général de l'Empire Ottoman*, vol. vii (Paris 1824), p. 573, cited on p. 48, footnote 1, above).

² Similarly, Weyer (in *op. cit.*, on p. 7) dwells upon 'the utter inability of the Eskimo culture to fit life-conditions outside of the arctic and sub-arctic regions'. In this connexion, it is to be noticed that, while 'the Eskimos are among the most widely distributed of primitive peoples' (*op. cit.*, p. 3), the physical features of their thirty-four-hundred-mile-long habitat are singularly uniform (at least in so far as they are of concern to Man),

the Spartan Regent Pausanias, when circumstances placed him in command of a Pan-Hellenic force on Achaemenian territory, had been an awful warning which had counted for much in the Spartan Government's decision to abdicate from the leadership of Hellas in 479-478 B.C. And this decision was almost justified in retrospect when, in and after the second and conclusive round of the Great War of 431-404 B.C., Sparta was forced to send abroad Pausaniases by the dozen. 'We have done those things which we ought not to have done and we have left undone those things which we ought to have done, and there is no health in us' must have been the reflection that forced itself, on the morrow of Leuctra, upon the mind of a Spartan statesman like King Agesilaus who was old enough to remember the *ancien régime*.

In that year 371 B.C. the majority of the Spartiate 'Peers' were serving, outside the frontiers of Laconia, on garrison duty in other Hellenic states which had once been Sparta's voluntary allies, but which could no longer be held to their allegiance except by naked military force; and the pick of them had been seconded from their military duties in order to occupy political and administrative posts in which they were making themselves as notorious, on a petty scale, as Pausanias himself, for their Spartan tactlessness and tyranny and corruption, until the respectable title of 'moderators' (*ἀρμοσται*), by which these Spartan martinets abroad were called, had come to sound odious in Hellenic ears. These very Spartiate 'Peers', who were making the Spartan name stink as fish out of water, would no doubt have manifested the traditional Spartan virtues if Fate had allowed them to fulfil the expectations in which they had grown up by leaving them to live their camp-life on the banks of the Eurotas until the Lacedaemonian Army was mobilized for the Leuctra campaign. Unfortunately for their own reputation and their country's, all these men were absent at that grave hour, and, in the Lacedaemonian contingent of the army under King Cleombrotus's command which was so signally defeated by the Thebans at Leuctra in 371 B.C., there were only 400 Spartiates in action apart from the 300 'knights' who always formed a Spartan King's personal body-guard on active service. This figure seems to mean that, in the Lacedaemonian infantry of the line, on this critical occasion, only one man was a Spartiate in every ten, instead of the four Spartiates in every ten Lacedaemonians which was the regulation quota.¹

and that this uniformity of the Esquimaux' physical environment is reflected in the cultural uniformity (op. cit., pp. 3-4) of their social life.

¹ The regulation quota (see Annex III, below) appears to have been four Spartiates in every ten Lacedaemonians, the other six being citizens of the autonomous Laconian cities (*περίοικοι*). At Leuctra, it may be conjectured that the places of the three Spartiates out of the four in every ten Lacedaemonians, who were now missing, were filled by Helots who had been enfranchised, in consideration of volunteering for heavy

74 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS

If the Spartiate quota had not been thus cut down, at Leuctra, to a quarter of its normal strength, we may doubt whether even the valour of the Theban infantryman and the tactical genius of the Theban commander Epaminondas, who knew how to turn his troops' fighting-power to the best account, would have been able to achieve their historic success of breaking that record of Lacedaemonian invincibility which had remained unbroken, down to that date, for at least two centuries and a half.

Moreover, the Spartan victory over Athens in the Great War of 431-404 B.C. ruined Sparta in other and subtler ways, besides the compulsion which it put upon her to second her 'Peers' from military service, from which they could not safely be spared, to non-military duties with which they could not safely be entrusted. It ruined her, for example, by exposing her belatedly, and therefore disastrously, to the subversive social effects of a money economy from which her people had so long been artificially sheltered. 'The date at which Lacedaemon was first attacked by social disease and corruption practically coincides with the moment at which she overthrew the Athenian Empire and gorged herself with the precious metals.'¹ And the introduction of a money economy brought in its train an equally subversive revolution in the Spartan attitude towards personal property. Spartan conservatism could not, indeed, bring itself to go the length of allowing real estate to be bought and sold in the market; but at some date unknown in the fourth century B.C. the Spartan Assembly passed into law 'a bill making it legal for the holder of a family property or an allotment to give it away during his lifetime, or to bequeath it by will, to anybody whom he chose'.² The effect of this piece of legislation in reducing the numbers of the Spartiate 'Peers' must have been much greater than the effect of the relatively light Spartiate casualties at Leuctra, and possibly as great as the effect of the loss of Messenia, which was the political penalty of Sparta's military defeat. When Aristotle was writing his *Politics*, this unfortunate law was already producing noticeably untoward results.³ By the time of King Agis the Martyr, who came to the throne early in the latter half of the third century B.C., 'not more than 700 Spartiates survived, and of these perhaps 100 may have owned land and an allotment, while the remainder were a destitute and disfranchised mob'.⁴

infantry service, under the name of 'New Members' (*νέοι μέλη*). For these figures see Toynbee, *op. cit.*, pp. 271-2.

¹ Plutarch's *Life of Agis*, ch. v, *ad init.* The whole account of the state of Sparta in the middle of the third century B.C., which is given in chs. v-ix, deserves study.

² Plutarch, *op. cit.*, loc. cit. The dates *post quem* and *ante quem* of the 'rhetra' of Epitadeus are the termination of the Atheno-Peloponnesian War in 404 B.C. and the publication, circa 325 B.C., of Aristotle's *Politics*. (Toynbee, *op. cit.*, p. 272, footnote.)

³ Aristotle, *Politics*, 1270 A 15-39.

⁴ Plutarch, *op. cit.*, loc. cit.

Another conspicuous social phenomenon in the Spartan, as well as in the Ottoman, decadence was 'the monstrous regiment of women' (*γυναικοκρατία*). Like the maldistribution of property, this maldistribution of influence and authority as between the two sexes was already noticeable at Sparta in Aristotle's time;¹ and in the legend of the Saviour Kings, Agis and Cleomenes, who reigned at Sparta a century later, the part assigned to the noble women who inspire and encourage and console and mourn the heroes is as prominent as it is in the New Testament.² This legend suggests that, notwithstanding Aristotle's strictures on the behaviour of the Spartan women during Epaminondas' invasion of the Eurotas Valley in the winter of 370-369 B.C.,³ it was really through their virtues that, in the age of Spartan decadence, the Spartan women established their moral ascendancy over their husbands and their sons; and, if this is the truth, it throws some light upon the failure of the 'Lycurgeoan' system. For although the system had been applied to women as well as to men, the Spartan girls and Spartan married women had not been subjected to its pressure in the same degree as their brothers and their husbands; and if we are right in our belief that the moral breakdown of Spartan manhood was the penalty of a moral rigidity which had been produced by the excessive severity of the 'Lycurgeoan' temper, then we may conjecture that it was the relative immunity of the women from this unnatural strain that left them with the moral elasticity to bend and rebound in reaction to an ordeal which broke the spirit of the Spartan men outright.⁴

¹ For the ascendancy of the Spartan women over the Spartan men in Aristotle's time, see his *Politics*, 1269 B 12-1270 A 31. No doubt the women had certain unfair advantages. For example, the habit of transferring landed property from one Spartiate family to another in the form of large dowries worked together with the effect of the heavy casualties among male Spartiates in war to create and maintain a class of Spartan heiresses, who doubtless understood how to turn their money-power to account. Aristotle also suggests that the Spartan women were excessively spoilt in psychological 'compensation' (to use our modern Western terminology) for the excessive severity of the discipline that was imposed upon the men. These fortuitous advantages may have given some Spartan women a social 'pull', but this does not really explain the ascendancy of the women at Sparta in the age of decadence, since this ascendancy was manifestly moral and not material in its essence.

² The literary relation between the legend of the Spartan Royal Martyrs and the story of the New Testament is discussed in Part V, below.

³ Aristotle, *Politics*, loc. cit.

⁴ In general terms we may say that the women of Sparta were less highly specialized than the men, and were therefore not so much at a loss to adapt themselves when the particular circumstances for which the 'Lycurgeoan' system had been expressly designed were replaced by new circumstances which called for a readjustment of the Spartan outlook and the Spartan attitude. What was true of 'Lycurgeoan' Sparta has probably been true in some measure of most societies in most ages. Whatever form of specialism a society may cultivate, the women are apt to go less far in specialization than the men; and whenever a society suffers a breakdown or disaster or reverse, the women, again, are apt to show greater elasticity and greater adaptability than the men in face of the new situation that arises. We may observe that the great Hellenic disaster of the Atheno-Peloponnesian War—a shock which caused the breakdown of the Hellenic Civilization—was accompanied by a rise in the prestige of women not only at Sparta but at Athens, as is attested by the war-plays of Aristophanes and by the role assigned to women in the

The epitaph of the 'Lycurgeoan' system has been written by Aristotle¹ in the form of a general proposition:

'Peoples ought not to train themselves in the art of war with an eye to subjugating neighbours who do not deserve to be subjugated. . . . The paramount aim of any social system should be to frame military institutions, like all its other institutions, with an eye to the circumstances of peace-time, when the soldier is off duty; and this proposition is borne out by the facts of experience. For militaristic states are apt to survive only so long as they remain at war, while they go to ruin as soon as they have finished making their conquests. Peace causes their metal to lose its temper; and the fault lies with a social system which does not teach its soldiers what to make of their lives when they are off duty.'

Thus the 'Lycurgeoan' system ultimately and inevitably destroyed itself; yet, even in committing suicide, the system died hard. Although it had been brought into existence for the precise purpose of enabling Sparta to maintain possession of Messenia, the 'Lycurgeoan' *agôgê* actually continued to be practised at Sparta, out of sheer conservatism, for nearly two centuries after Messenia had been irrevocably lost.² And although King Cleomenes the Martyr tardily replaced the 4,000 lost Spartiate allotments in Messenia by redividing the territory that remained to Sparta east of Taygetus, in the Eurotas Valley, into new allotments of an equal number,³ the royal revolutionary did not take this opportunity to liberate his country from the ancient curse of helotage. Since the 700 surviving Spartiates, all told, could not take up as much as 20 per cent. of the 4,000 allotments into which the estates of the 100 surviving Spartiate 'Peers' were now broken up, Cleomenes presumably gave the Spartan franchise to more than 3,000 Helots and Perioeci in order to fill up the numbers of his new Spartan citizen-body; but these were only a minority of the surviving Helots; for Cleomenes freed 6,000 more of them, at so much a head in ready money, and enrolled 2,000 of these freedmen in his army, on the eve of the Battle of Sellasia, when his Macedonian adversary Antigonos Dôson had reached Tegea.⁴ And when the Romans invaded Laconia in

Ecclesiastusae, in anticipation of the *Republic* of Plato. The writer of this Study has noticed, from personal observation, the superiority of the women's moral over the men's among the *ci-devant* aristocracy in the Southern States of the North American Union under the abiding shock of the Southern defeat in the Civil War, and the same phenomenon among the intelligentsia in China under the long strain of Westernization. The qualities which this ordeal of Westernization has called out among the women of Russia are a matter of common knowledge.

¹ Aristotle, *Politics*, 1333 B-1334 A.

² Messenia was liberated from Sparta by Epaminondas in 370/369 B.C.; the 'Lycurgeoan' *agôgê* was abolished at Sparta by Philopoemen in 189 B.C.

³ See Plutarch's *Life of Cleomenes*, ch. xi, and *Life of Agis*, ch. viii. The territory which Cleomenes redivided into his 4,000 new Spartiate allotments was only the territory of the Spartan city-state, and did not include the territories of the dependent but autonomous Laconian city-states which were inhabited by the *περίοικοι*. Cleomenes' forerunner Agis had intended to redivide this perioecic territory into 15,000 allotments and the Spartiate territory into 4,500.

⁴ Plutarch, *Life of Cleomenes*, ch. xxiii.

195 B.C., they found Helots still living on there in their traditional status.¹

The most remarkable feat of Spartan 'Diehardism' was the attempt of the Royal Martyrs, Agis and Cleomenes, to reclothe the dry bones of the 'Lycurgeoan' system in flesh, and to breathe the breath of new life into the corpse, a full century and a half after the great Spartan victory over Athens had sealed the 'Lycurgeoan' system's fate. In this last desperate *tour de force* the derelict wheel of Spartan life was turned, by a supreme conservative effort, so very far back that it actually made a revolution; and this violent movement finally wrecked the long-dislocated mechanism. Cleomenes' surgery effectively killed a body social which it could not possibly cure. The bruised reed was broken by the hand that sought to straighten it; and the smoking flax was quenched for ever by the breath which was intended to rekindle a flame.²

Thereafter Sparta lived wholly in her dreams of the past and distinguished herself—if it be a distinction—in nothing but the peculiar zest with which she threw herself into the academic game of archaism that was in fashion throughout the Hellenic World during the first two centuries of the Roman Empire.³ The Spartans of the Imperial age delighted, like all their contemporaries, in composing honorary inscriptions in a caricature of their obsolete local dialect; but at Sparta these harmless archaistic pedantries were accompanied by at least one archaistic morbidity of a gruesome nature. A primitive fertility-rite of scourging boys at the altar of Artemis Orthia, which had been converted by the 'Lycurgeoan' system, for its own grim but still utilitarian purposes, into a competition in the endurance of pain, was exaggerated, in Plutarch's day, into a sadistic atrocity, in which boys were keyed up to a pitch of hysteria at which they submitted to be flogged to death. 'This would not be incredible of the Spartan youth of the present day', Plutarch writes in recounting the famous legendary story of the Spartan boy and the stolen fox,⁴ 'since I myself have seen numbers of them die under the flogging at Orthia's altar.'⁵ The essence of this scene, in which a superhuman—or inhuman—feat of endurance is performed without flinching, yet to no effect, is characteristic of the Spartan ethos and emblematic of Sparta's fate. For if any Spartiate ever prayed, for the peace of his soul, that *tantus labor non sit cassus*, that prayer was assuredly breathed by Spartan lips in vain.

³ For Spartan archaism in the Imperial age, see Pauly-Wissowa, *Realencyclopädie der Classischen Altertumswissenschaft*, Zweite Reihe [R-Z], Dritter Band (Stuttgart 1929, Metzler), s.v. 'Sparta', pp. 1450-2.

⁴ For this story see p. 65, above.

⁵ Plutarch's *Life of Lycurgus*, ch. xviii, *ad init.*

The vanity of Spartan wishes is exposed in the outcome of an otherwise unimportant arbitral transaction which the Roman historian Tacitus records—apparently without realizing its historic significance—in his annals of the Roman Empire in the year 25 of the Christian Era:

'A hearing was given to delegations from the Lacedaemonian and Messenian Governments in the matter of the juridical status of the temple of Diana [i.e. Artemis] Limnâtis. The Lacedaemonians maintained that the temple had been founded by their own Lacedaemonian forefathers on Lacedaemonian territory, and they supported their claim by an appeal to literary evidence, both historical and poetic. They declared that the temple had been taken from them forcibly, in war, by Philip of Macedon, and had afterwards been restored to them on the strength of a legal opinion which had been rendered by Gaius Caesar and Marcus Antonius. The Messenians, on their side, brought up the ancient division of the Peloponnese among the descendants of Hercules [i.e. Héraklēs], and maintained that the territory of Dentheliâtis, in which the temple was situated, had been part of the portion assigned to their king. They declared that there were actual records of the transaction still extant, engraved on stone and on archaic bronze; and they added that, if there was to be an appeal to literary evidence, they could also beat the Lacedaemonians in the amount and in the fullness of the testimony of this kind which they were in a position to cite. As for King Philip's decision, they argued that it had not been an act of arbitrary power, but had been based upon the facts and had been confirmed by identic judgements of the Macedonian king Antigonos and the Roman general Mummîus; by an arbitral decision of the Milesian Government; and most recently by the decision of Atidius Geminus, the Governor of the Roman Province of Achaea. On this showing, judgement was now given in the Messenian Government's favour.'

Thus, in the first century of the Christian Era, the Spartans were still contending—and this last time without success—over the debatable territory in the mountainous borderland between the Eurotas Valley and Messenia which their forefathers had originally contended for, and conquered, in the eighth century B.C. A dispute over the Dentheliâtis was the traditional cause of the First Messeno-Spartan War; and now, after the passage of at least eight centuries, the same dispute between the same two parties over the same insignificant piece of territory was at issue before the arbitral tribunal of the Roman Emperor Tiberius. Assuredly no further proof is needed that the Spartans were veritably a people without a history. And if the reader of this passage from Tacitus happens, like the writer of this Study, to have traversed the Dentheliâtis in person, *en route* through the Langádha defile from Sparta to Kala-

¹ Tacitus: *Annals*, Bk. IV, ch. 43 (*imperante Tiberio Caesare, Anno Christi 25*).

máta, he must have marvelled to think that such a stupendous *tour de force* as the 'Lycurgean' *agógē* should have been evoked by a desire to possess this patch of highland, with its bare scree and scraggy pine-woods and rare flecks of jejune upland pasture. As the traveller wends his weary way over one rocky ridge after another, he will find himself repeating Oxenstierna's aphorism¹ before he arrives at his Messenian journey's end.

The Reversion to Animalism.

The Spartan body social is the last of the arrested civilizations that we have set ourselves to review; and, now that we have concluded our survey, we may perhaps find ourselves able to lay our finger upon certain common characteristics of this particular class of the species of society which is the object of our study. The two characteristics, common to all these arrested civilizations, that stand out prominently are caste and specialization; and both these phenomena can be embraced in a single formula: The individual living creatures which each of these societies embraces are not all of one single homogeneous type, but are distributed among two or three different categories which differ from one another markedly.

It is of the essence of these arrested civilizations that they are socially composite or polymorphous. In the Eskimo Society, for example, there are two castes: the human hunters and their canine auxiliaries who assist them in two capacities: partly as hunting-dogs and partly as sledge-dogs. In the sub-arctic branch of the Nomadic Society, on the Eurasian Tundra, there are three castes: the human herdsmen; the reindeer used as mounts and beasts of burden; and the same reindeer in their other capacity as cattle tended for the sake of their milk and flesh. In the other branches of the Nomadic Society, on the Eurasian and Afrasian Steppes, there are likewise three castes, but with a greater range of variety in the types. Among these Nomads, there are first the herdsmen or shepherds; second, their animal auxiliaries (dogs, horses, and camels); and, third, their cattle (kine, sheep, and goats). In the Ottoman body social we find the equivalents of the three castes of the Nomadic Society with the substitution of human beings for animals. Whereas the polymorphic body social of Nomadism is constituted by the assemblage, into a single society, of human beings and animals who would none of them be capable of making a livelihood on the Steppes in dissociation from their partners, the polymorphic Ottoman body social is constituted by the exactly opposite process of artificially differentiating a naturally homogeneous Humanity into human castes which are treated, by an

¹ See Part I. C (iii) (e), Annex, vol. i, p. 463, footnote 2, above.

80 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
inhuman social fiction, as though they differed from one another in nature as widely as human beings actually differ from domesticated animals and as domesticated animals differ among themselves.

This point of unlikeness in the constitutions of those arrested civilizations which are at grips respectively with a physical and with a human environment has been touched upon above;¹ but for our present purpose we may ignore it, since it is a difference of genesis and not a difference of ultimate form. For our present purpose we have simply to take note of the Ottoman castes and of their correspondence to the Nomadic castes. The Ottoman Pādishāh himself is a shepherd of men; his trained human slaves (*qūllar*) correspond to his Nomadic forefathers' auxiliary animals; while the function of the rest of the Pādishāh's subjects in the Ottoman social system is plainly indicated by their official designation as human cattle (*ra'iyeh*). In the 'Lycurgean' system at Sparta we rediscover the same three castes again (though the Spartan community was not of Nomadic origin). In Laconia the Helots are the human cattle, the Spartiate 'Peers' are the human equivalents of the Nomad's trained animal auxiliaries, while the place of the shepherd of sheep or the shepherd of men is occupied at Sparta by an impersonal but not less mighty power: the Law 'whose service is' the 'perfect freedom'² of the Spartiate 'Peers', although—or perhaps because—they stand in just as much awe of it as the slaves of a Xerxes or a Suleymān stand in awe of the Pādishāh.³

This caste system tends to produce some kind of metamorphosis in the various living creatures that become parties to it. The Eskimo's dog and the Nomad's horse and camel are half humanized by their partnership with Man in hunting or tending other animals. On the other hand, the Ottoman *ra'iyeh* and the Laconian Helots are half dehumanized through being treated as human cattle. Other human partners in these associations are transformed into super-human or inhuman monsters and *Mischwesen*. The perfect Spartiate is a Martian, the perfect Janissary a monk, the perfect Nomad a centaur, the perfect Eskimo a merman.

The Spartiate stands self-convicted of being the perfect Martian in the following anecdote:

'Hearing on one occasion that the allies of Sparta were chafing at the perpetual campaigns in which they had to follow the Lacedaemonians' lead when the Lacedaemonians were so inferior to them in numbers, Agesilaus determined to put this question of numbers to the test. So

¹ See pp. 22-3, above.

² The Second Collect, for Peace, in the Order for Morning Prayer of the Book of Common Prayer of the Church of England.

³ For the formula 'Spartan Law: Spartiate Peer = Xerxes: Persian Immortal' see the apocryphal conversation between Xerxes and Dāmarātus which has been cited on pp. 64-5, above.

he ordered all the allies to parade together in one company and the Lacedaemonians to parade separately by themselves. Then he ordered all potters, first, to step out of the ranks; and, when these had stepped out, he next gave the same order to the smiths, and then, in succession, to the carpenters and to the builders until he had run through all the trades. By the end, practically every man of the allies had stepped out, but not a single Lacedaemonian,¹ since the Lacedaemonians were debarred from learning or following any vulgar trade by their constitution. Then Agesilaus laughed and said: "You see, gentlemen, how many more *soldiers* Sparta sends on active service than *you* send."²

The intention of this anecdote is, of course, to glorify the Spartiates at the other Peloponnesians' expense; but, on a more penetrating view, the missile hurled by Agesilaus at his allies' heads looks very like a boomerang. The military superiority of the Spartiates over the non-Spartiates, which is impressive so long as we do not look beyond their respective performances on the battlefield, loses half its glamour as soon as it is brought home to us that the Spartiates are whole-time professionals while their non-Spartiate comrades-in-arms are part-time amateurs. When we give due weight to this crucial point of difference between them, we become inclined to consider the Spartiates' actual superiority less remarkable, in the circumstances, than the fact that the non-Spartiate Peloponnesian amateurs have been able, in their spare time, to turn themselves into good enough soldiers to be able to serve in the same ranks at all with professionals who have had such a vastly greater opportunity of making themselves masters of the military craft. Though the non-Spartiate Peloponnesians naturally cannot emulate the Spartiates in the profession to which the Spartiates have devoted their lives, it is open to them, in compensation, to apply to themselves, in a modest degree, the Athenian boast in which the Athenians took especial pleasure just because it conveyed an implicit criticism of their Spartan rivals' way of life:

'We . . . differ in our military institutions from our opponents. . . . We leave it to them to cultivate manliness by a laborious training from their tender years upwards, while we, with our undisciplined life, are as ready as they to face every reasonable danger. . . . The fact that we preserve a military spirit by a life of ease instead of deliberate hardship and by a natural rather than an artificial courage gives us a double advantage. We are not compelled to anticipate the rigours of war; yet we face them,

¹ This is not strictly accurate, since the citizens of the autonomous cities of Laconia, who served shoulder to shoulder with the Spartiates in the Lacedaemonian Army, were not full-time professional soldiers, but a militia of citizens who normally practised some civilian trade, just like the troops furnished by Sparta's non-Laconian allies. To give the story its proper point, the word 'Spartiate' should be substituted for the word 'Lacedaemonian' throughout the passage.—A. J. T.

² Plutarch: *Apophthegmata Laconica*, *Agesilaus*, No. 72, and *Life of Agesilaus*, ch. xxvi.

when they come, as courageously as those who are in perpetual training. . . . Besides all this, we cultivate the arts without extravagance and the intellect without effeminacy. . . . Our politicians do not neglect their private affairs, and the rest of us devote ourselves to business without losing touch with politics. . . . In short, I maintain that the Commonwealth of Athens is the School of Hellas, and that the individual Athenian will never meet his equal for self-reliance, versatility, and gallantry, in whatever situation he may find himself.¹

Thus the Athenian glorified his own Attic humanism by pointing the contrast with the Martian inhumanity in which the Spartiate took pride. And, if the Spartiate struck his neighbours, and fancied himself, as a Martian 'robot', the Janissary, who was the Ottoman equivalent of a Spartiate 'Peer', made a monkish impression, on first view, upon the mind of the Flemish observer Busbecq:

'In the citadel of Buda there is a permanent garrison of Janissaries . . . and a pair of these Janissaries used generally to wait upon me. When they were shown into the dining-room, they would salute me with bowed heads; and then they would approach me—at a pace which was almost a run—and touch my coat or my hand, as though they were going to kiss it; offer me a bunch of hyacinths or narcissi; and forthwith retire almost as rapidly as they had advanced—this time walking backwards, in order to avoid turning their backs on me (which would be a breach of courtesy in their code of manners). At the door they would stand in silence and with the utmost decorum—their hands folded on their breasts and their eyes downcast—so that they reminded one of our Western monks rather than of our Western soldiers. . . . In fact, if I had not been told beforehand that these were Janissaries, I might easily have mistaken them for some order of Turkish monks, or for the fellows of some kind of college. Yet these are the notorious Janissaries who spread terror wherever they go.'²

As for the Nomad centaur, his portrait is painted in the following passage from the pen of one of the most gifted Western observers of Nomadic life on the Eurasian Steppe:

¹ From the funeral oration delivered by Pericles over the Athenians who had fallen in the first campaign of the Atheno-Peloponnesian War of 431-404 B.C., as reported by Thucydides, Bk. II, chs. 34-46. Compare the passage already quoted from the same speech on p. 64, above.

² *A. Gisleii Busbecqii Omnia quae Extant* (Leyden 1633, Elzevir), pp. 24-5. The same comparison suggested itself to the mind of an English observer more than a century later: 'He who hath run through the several schools, orders, and degrees of the Seraglio must needs be an extraordinary mortified man, patient of all labours, services, and injunctions, which are imposed on him with a strictness beyond the discipline that religious novices are acquainted with in monasteries, or the severity of Capuchins or holy votaries.' (Rycaut, *op. cit.*, Bk. I, ch. v.)

We may take note, in passing, of another important characteristic, besides the virtues of modesty and austerity and self-control, which the Janissaries of Busbecq's day possessed in common with the monastic orders of Western Christendom. The Janissaries resembled the monks, and differed from the Spartiates, in their admirable rule of tempering their professionalism by learning and practising manual trades. For the prominence given to handicrafts in the education of the Ottoman Pādishāh's slave-household, see p. 39, footnote 4, and p. 59, footnote 3, above.

'L'éducation des jeunes Mongols . . . consiste à s'exercer dès l'enfance au maniement de l'arc et du fusil à mèche; l'équitation surtout les absorbe presque entièrement. Aussitôt qu'un enfant est sevré, et que ses forces se sont suffisamment développées, on l'exerce à aller à cheval: on le fait monter en croupe, puis on commence une course au galop, pendant laquelle le jeune cavalier se cramponne de ses deux mains à la robe de son maître. Les Tartares s'accoutument ainsi de bonne heure au mouvement du cheval; et bientôt, à force d'habitude, ils finissent par s'identifier, en quelque sorte, avec leur monture. . . .

'Le Mongol est tellement accoutumé à aller à cheval, qu'il se trouve tout-à-fait désorienté et comme jeté hors de sa sphère, aussitôt qu'il a mis pied à terre. Sa démarche est pesante et lourde; la forme arquée de ses jambes, son buste toujours penché en avant, ses regards qu'il promène incessamment autour de lui, tout annonce un cavalier, un homme qui passe la plus grande partie de ses jours sur un cheval ou sur un chameau.

'Quand les Tartares se trouvent en route pendant la nuit, il arrive souvent qu'ils ne se donnent pas même la peine de descendre de leurs animaux pour prendre leur sommeil. Si on demande aux voyageurs qu'on rencontre où ils ont passé la nuit. . . . *Temen dero* (sur le chameau) répondent-ils, d'une voix mélancolique. C'est un singulier spectacle, que de voir les caravanes faire halte en plein midi, lors qu'elles ont trouvé un gras pâturage. Les chameaux se dispersent de côté et d'autre, broutant les grandes herbes de la prairie, tandis que les Tartares, à califourchon entre les deux bosses de l'animal, dorment d'un sommeil aussi profond que s'ils étaient étendus dans un bon lit.'

Here we are shown the picture of a rider who is so completely at home astride his mount that the twain—man and beast—have virtually become one flesh. And one of our foremost modern Western anthropologists has gone so far as to suggest, in a brilliant imaginative reconstruction of a lost chapter of pre-Nomadic history, that the intimate association of Man and Horse on the Steppe has actually produced far-reaching and permanent modifications in the physical type of the human participants in the partnership.

'It is not necessary to suppose that within the great plateaux of Central Asia there was perennial snow, or a wholly uninhabitable region [during the Ice Age]. Rather the vast accumulations of loess, the deposit of countless dust storms, suggest a "continental" climate with wide variations, and the possibility of at least seasonal occupation by fleet grazing-animals, such as the horse. It is indeed to an intimate parasitic connexion with such an animal "host", in some such circumstances, that we have probably to ascribe the highly specialized type of Man characteristic of this region now. The yellow skin-colour of Mongoloid Man gives him protective camouflage in sandy desert and dry-grass steppe; the structure of his straight wiry hair, and its rarity except on the scalp, suggest adaptation to a continental climate; while its extreme length in

¹ Huc, l'Abbé: *Souvenirs d'un Voyage dans la Tartarie, le Thibet et la Chine pendant les années 1844, 1845, et 1846* (Paris 1850, Le Clere, 2 vols.), vol. i, pp. 93-5.

both sexes serves to disguise the characteristic profile of the human head and neck, and approximate it to that of a quadruped seen from behind. From the rather prominent jaw combined with globular brain-case may be inferred long habituation to some food which minimized the pull of the jaw-muscles on the side-walls of the skull; and the only food which fulfils this condition is milk and its products, on which Nomad Tartars still live almost exclusively: the absence of face-hair, the short concave nose with spread nostrils, the peculiar infantile lips, the wide flat face and obliquely set eyes, are adaptations we should expect if for ages this milk was absorbed direct from the udder; and the short legs of some Mongoloids, and poor development of the calf-muscles in all, suggest that, like Tartar infants nowadays, the parasitic proto-Mongol sat tight upon his host between meals, and shared its wanderings. On the Steppes of glacial Europe, Man hunted and ate the horse; if we suppose that in Central Asia, during the same and perhaps in long earlier periods, he made friends with him and lived upon his friendship, we seem to have a clue to the paradox of the emergence of a highly specialized breed of Man from a region which had been for a very long time so little suited, except on these terms, to sustain him at all.¹

This Mongol centaur of the Eurasian Steppe has his counterpart in the Eskimo merman of the American arctic waters. While the Nomad has become of one flesh with his domesticated animal mount, the Eskimo—reacting to an equally severe physical environment by performing an equally exacting, and exact, *tour de force*—has become, so to speak, of one skin with his man-made inanimate water-craft. The Eskimo kayak is an adaptation, for sea-faring, of the canoe in which the Esquimaux's North American Indian cousins navigate their inland waters. In kayak and canoe the structural element is identical. Both types of craft are built round a wooden framework. But whereas the Indian canoe is an open boat with a hull of birch bark, the Eskimo kayak, which has to face heavier weather, is covered with seal-skin and is decked over, as well, with the same material.

'As a rule, each hunter makes his kayak for himself, and it is fitted to the man's size just like a garment. . . .

'In the middle of the kayak's deck there is a hole just large enough to enable a man to get his legs through it and to sit down; his thighs almost entirely fill the aperture. Thus it takes a good deal of practice before one can slip into or out of the kayak with any sort of ease. The hole is surrounded by the kayak-ring, which consists of a hoop of wood. It stands a little more than an inch (3 or 3½ centimetres) above the kayak's deck, and the waterproof jacket . . . is drawn over it.

¹ Myres, J. L.: 'Primitive Man in Geological Time', in *The Cambridge Ancient History*, vol. i, 2nd ed. (Cambridge 1924, University Press), p. 22. These fascinating speculations are an admirable mythological expression of the truth about the Nomad's relation to his environment, even though they may be beyond the range of scientific verification.

'In fair weather the kayak-man uses the so-called half-jacket (*akui-lisak*). This is made of water-tight skin with the hair removed, and is sewn with sinews. Round its lower margin runs a draw-string, or rather a draw-thong, by means of which the edge of the jacket can be made to fit so closely to the kayak-ring that it can only be pressed and drawn down over it with some little trouble. This done, the half-jacket forms, as it were, a water-tight extension of the kayak. The upper margin of the jacket comes close up to the armpits of the kayak-man, and is supported by braces or straps, which pass over the shoulders and can be lengthened or shortened by means of handy runners or buckles of bone, so simple and yet so ingenious that we, with all our metal buckles and so forth, cannot equal them. . . . This half-jacket is enough to keep out the smaller waves which wash over the kayak. In a heavier sea, on the other hand, the whole-jacket (*tuilik*) is used. This is made in the same way as the half-jacket and, like it, fits close to the kayak-ring, but is longer above, has sleeves attached to it, and a hood which comes right over the head. It is laced right round the face and wrists, so that, with it on, the kayak-man can go right through the breakers and can capsize and right himself again, without getting wet and without letting a drop of water into the kayak.

'It will readily be understood that it is not easy to sit in a vessel like the kayak without capsizing, and that it needs a good deal of practice to master its peculiarities. . . . But when one has acquired by practice a mastery of the kayak and of the two-bladed paddle, one can get through the water in all sorts of weather at an astonishing speed. The kayak is beyond comparison the best boat for a single oarsman ever invented.

'In order to become an accomplished kayak-man, one ought to begin early. The Greenland boys often begin to practise in their father's kayak at from six to eight years old, and when they are ten or twelve the provident Greenlander gives his sons kayaks of their own. . . . From this age onwards, the young Greenlander remains a toiler of the sea. . . .

'You cannot rank as an expert kayak-man until you have mastered the art of righting yourself after capsizing. . . . An Eskimo told me of another who was so extraordinarily skilful at righting himself that he could do it in every possible way: with or without an oar, with or without a throwing-stick, or with his clenched hand. The only thing he could not right himself with was—his tongue! . . .

'A kayak-man who has entirely mastered the art of righting himself can defy almost any weather. If he is capsized, he is on even keel again in a moment, and can play like a sea-bird with the waves, and cut right through them. . . . The prettiest feat of seamanship I have ever heard of is that to which some fishers, I am told, have recourse among overwhelming rollers. As the sea curls down over them they voluntarily capsize, receive it on the bottom of the kayak, and when it has passed right themselves again.'

This perfect unison between the Eskimo and his kayak or be-

* Nansen, F.: *Eskimo Life* (London 1893, Longmans, Green & Co.), pp. 46-54. The whole relevant passage, from p. 44 to p. 77 inclusive, is worth studying.

tween the Nomad and his mount is a marvellous *tour de force*; and, when we contemplate it, our first impression is that we are viewing one of the highest flights of human achievement. This impression is not false so far as it goes; but there is another aspect of the picture which comes to light after further consideration. In either case, the essence of the achievement is the mastery, by a human being, of some non-human animal's prowess.¹ The Nomad centaur acquires the prowess of a horse, the Eskimo merman the prowess of a seal; and for human beings these accomplishments are extraordinarily difficult. The difficulty, however, lies just in this, that an animal is enabled to perform its specific prodigies thanks to the organic—and therefore one-sided and rigid and unalterable—adaptation of its physique to just these particular functions and to these functions only. The animal solves its problem by developing a special permanent organ or a special permanent instinct for the purpose, whereas the man who seeks to emulate the animal's feat has been endowed by Nature with no physical equipment except the human eye and human hand, and with the mental equipment of an errant amateur reason in place of an infallible professional instinct.² The *tour de force* is manifestly so very difficult indeed that we ask ourselves how it is possible for human beings to perform it at all; and then, upon further examination, we observe that they actually perform it by a device which is so obvious that we ought to have detected it *a priori*.³

¹ 'An ingenious hunting device can take the place of fleetness of foot or sharpness of tooth or talon.' (Weyer, *op. cit.*, p. 65.)

² 'La vie est un certain effort pour obtenir certaines choses de la matière brute, et . . . instinct et intelligence, pris à l'état achevé, sont deux moyens d'utiliser à cet effet un outil: dans le premier cas, l'outil fait parti de l'être vivant; dans l'autre, c'est un instrument inorganique, qu'il a fallu inventer, fabriquer, apprendre à manier.' Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), p. 122. The same point is put very clearly by Ibn Khaldūn: 'To every animal, God has given an organ specially designed for repelling its enemies. But to Man He has given, instead, the human intelligence and the human hand. The hand, under the control of the intelligence, is always ready to work at the arts; and the arts furnish Man with the instruments that replace, for him, the organs that have been assigned to the other animals for their defence. Thus lances take the place of horns, swords the place of claws, shields the place of tough thick hides.' (*Muqaddamāt*, translated by de Slane, Baron McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. i, p. 87.)

³ The extremeness of the *tour de force* which is performed by the Eskimo is forcibly represented by Weyer in *op. cit.* on p. 65. Weyer points out that 'physically the Eskimo is in all essential characteristics like other men. Strip him of his clothing, deprive him of his tools and implements, his dwellings, and his ability to create these things essential to life, and he would be scarcely more fit to survive in his northern environment than a savage from the tropical jungle'. *A fortiori*, the Eskimo is at a physical disadvantage, in the struggle for existence in this environment, by comparison with the non-human fauna which he has found in the field and at whose expense he makes his livelihood. Weyer points out that 'what' the Eskimo 'lacks as a physical organism he acquires through ingenuity and invention', and that 'in this manner Man's culture takes the place of physical adaptations among the lower animals'. Weyer, however, does not go on to point out in this connexion that, while 'the Eskimo cannot compete with the animals as an animal' and 'is not compelled to', it is also true that he has assimilated himself to the non-human fauna of his physical environment in a subtler way by sacrificing the adaptability, which is the distinctive quality of his distinctive mental powers, and forcing his mobile human spirit, as far as it can be forced, into the rigid posture of animal automatism—as is suggested in the present Study in the paragraphs that here follow.

These Esquimaux and Nomads and 'Osmanlis and Spartiates achieve what they achieve by putting off their human nature as far as possible, and assuming an animal nature instead. If, being human, they cannot really live and act by instinct, they can still train reason to simulate instinct by imprisoning their thought within the confines of a 'single-track mind'. And if they cannot grow the flippers and tails and waterproof skins of seals to make them at home in the sea, or the legs of horses to make them at home on the Steppe, or the fangs of wolves to give them dominion over human cattle, they can at least extend the limited capacities of their human limbs by devising instruments—animate or inanimate—with which they teach their own arms and legs to enter into such an exquisitely harmonious co-operation that the effect is almost as though they had succeeded in adding a cubit to their stature. The Eskimo acquires an artificial seal's body in the shape of his kayak and an artificial pair of flippers in the shape of his double-bladed paddle. The Nomad acquires an artificial horse's or camel's body in the shape of his mount. The Spartiate acquires an artificial fang in the shape of his spear-head and an artificial carapace in the shape of his shield.¹

These are, indeed, miracles of human will-power and human ingenuity; but the faculty of working miracles has to be bought at a price, and in this case the price turns out to be so high that those human beings who have consented to pay it might have done better to reject it as prohibitive. The price paid has been nothing less than the determined and systematic repudiation of those very qualities of the human hand and the human eye and the human reason which are distinctive of human nature. The distinctive quality of the human mind is its adaptability. With its manifold analytic and synthetic and mimetic mental faculties, and its versatile physical informants and executants the human eye and the human hand, the mind of Man is capable of unlimited achievement on the one condition that it faithfully follows the bent of its own genius.²

¹ In the song of Hybrias (the uncouth Cretan cousin of Spartan Brasidas and Leonidas and Agesilaus), the spear and shield and sword are recognized, with conscious cynicism, as being the artificial organs through which a human parasite contrives to live upon the labours of an unwilling human 'host':

I have great riches, spear and sword
And raw-hide fluttering at my breast;
My land is ploughed, my harvest stored,
My sweet wine from the vintage pressed,
The Mnoan trash hath learnt its Lord,
By spear and sword.

And all who dare not walk with spear
And sword and raw-hide fluttering,
They needs must kiss my knees, and cling,
And hail me, cowering in their fear,
Lord and Great King!

(Translation by Gilbert Murray.)

² As Weyer expresses it (in op. cit., on p. 66), 'men can modify their culture, whereas

In forcing their human minds into the similitude of animal psychology, and their human legs and arms into the similitude of animal morphology, the Esquimaux and the Nomads and the 'Osmanlis and the Spartans have betrayed their own humanity. They have set their feet on the path of retrogression from humanity towards the animalism out of which Humanity evolved itself once upon a time by one of the greatest creative acts that have yet been achieved in the life-history of the Universe. They have committed the unpardonable sin of Lot's Wife, and in committing it they have duly brought upon themselves the Biblical penalty. Like pillars of salt, they stand bewitched and arrested for ever at the very outset of their life's journey, as an awful warning to other civilizations that are in the act of making their own transition from genesis to exodus.

'The necessity for effort—the "struggle for existence" in the most general sense—has from age to age raised the average level of independence, the measure of individuality's perfection in living beings. In spite of this general rise of level, there has been in every age a falling away, a decline in perfection of individuality in certain species. This decreased independence reveals itself not only as structural degeneration but also in degeneration's opposite, structural specialization. There is, however, a common cause beneath these opposed effects, and that is over-close adaptation, adaptation to very narrow conditions.

'It is self-evident that all organisms must be more or less adapted to their surroundings; in other words they must be more or less dependent upon their environment. Failure to exist in any but a very limited environment is obviously a weakness, a lack of independence, and it seems to be a fact that adaptation to any such limited environment makes it impossible or very difficult for an animal to exist in any other environment. The very success of the adaptation decreases the creature's adaptability.'¹

Insect Societies and Human Utopias

If we wish for corroborative evidence in support of our conclusion that the turn taken, at the outset, by the Spartan and the 'Osmanli and the Eskimo and the Nomadic Civilization was a blind alley, we shall find what we seek by comparing the social structure of these four actual arrested human societies with that of the imaginary human societies called Utopias, or again with that of the

animals cannot modify their bodily organisms appreciably'. And he goes on to maintain that the application of 'this interpretation of cultural evolution' to the Esquimaux 'is uncommonly striking'. This is, of course, manifestly true if we confine our attention to the first chapter in the Esquimaux's cultural history—the chapter, that is to say, which covers their original feat of adapting their life to the Arctic physical environment. On the other hand, in the ensuing chapter the Esquimaux have hardened into a cultural immobility which is the very antithesis of the characteristic human habitus and which is, *pace* Weyer, very strongly reminiscent of the comparative fixity of the animals.

¹ Huxley, J. S.: *The Individual in the Animal Kingdom* (Cambridge 1912, University Press), pp. 131-2.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 89

social insects. If we enter into the comparison, we shall discern in an ant-heap and in a bee-hive, as well as in Plato's *Republic* or in Mr. Aldous Huxley's *Brave New World* or in Mr. H. G. Wells's fantasy of a lunar society, the same outstanding features that we have now learnt to recognize in all the arrested civilizations which we have been studying. The two phenomena of caste and specialization, and the fatally perfect adaptation of the society to its particular environment which these two phenomena bring about between them, are just as characteristic of the Utopian and the Insect World as they are of the four actual human societies, just examined, which have suffered arrest. And these resemblances are significant, since the insect societies and the Utopias are both patently in a state of arrested development likewise.

The social insects rose to their present social heights, and came to a permanent standstill at those altitudes, many millions of years before *Homo Sapiens* began to emerge above the mean level of the rank and file of the Vertebrate Order.¹ And as for the Utopias, they are static not only as a matter of fact but *ex hypothesi*. For these fictitious descriptions of imaginary human societies that have never existed are really programmes of action masquerading in the disguise of descriptive sociology; and the action which they are intended to evoke is the 'pegging', at a certain social level, of an actual society which has broken down and has entered upon a decline that must end in a fall unless the downward movement can be artificially arrested. To arrest a downward movement is the utmost to which a Utopia can aspire, since Utopias seldom begin to be written in any society until after its members have lost the expectation and ambition of making further progress and have been cowed by adversity into being content if they can succeed in holding the ground which has been won for them by their fathers. Hence, in almost all Utopias—with the noteworthy exception of that work of English genius which has given this whole genre of literature its modern Western name²—an invincibly stable equilibrium is the

¹ Wheeler, W. M.: *Social Life among the Insects* (London, no date, Constable), pp. 6-9.

² In More's *Utopia* there are indeed traces of those elements, copied or caricatured from the living reality of the 'Lycurgeoan' system of Sparta, which we shall have occasion to notice below in glancing at the Athenian Utopias of the age immediately posterior to the breakdown of the Hellenic Civilization in the Great War of 431-404 B.C. For example, More's Utopians entertain and display a supreme contempt for the precious metals (ch. vi), and in the communal messes the menial domestic service is performed by bondsmen. Yet, considering More's great knowledge of, and deep regard for, the Greek and Latin classics, and the high prestige of Hellenic Antiquity in the Western World of More's day, it is really surprising that the traces of Plato's and Aristotle's influence in More's *Utopia* are not more prominent than they are. And it is still more remarkable to find More parting company with his Hellenic ensamples in matters which are clearly of fundamental importance. For example, the contempt for the precious metals is offset by the importance which is assigned, in the same chapter, to overseas trade (ch. vi). Again, the employment of bondsmen in menial domestic service is reduced

90 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
supreme social aim to which all other social values are subordinated and, if need be, sacrificed.

This is true of the Hellenic Utopias which were conceived at Athens in the schools of philosophy that arose there, or established themselves there, in the age immediately following the catastrophe of 431-404 B.C., in which the Hellenic Civilization had broken down.¹ It is also true of certain modern Western Utopias which have been conceived in England either shortly after or shortly before the catastrophe of A.D. 1914-18: a great war which may or may not prove to have been the undoing of our own Western Civilization.²

The Utopias which were published in Athens in the fourth century B.C. bear the marks of their time and their place. Their negative inspiration is a profound hostility to Athenian democracy. For, after the death of Pericles, Athenian democracy had dissolved its brilliant partnership with Athenian culture under the stress of the Great War; it had developed a crazy and virulent militarism that brought devastation upon the world in which Athenian culture

to its true proportions when we find (in ch. viii, *ad init.*) that the institution of bondage is maintained in Utopia not—as in 'Lycurgeoan' Sparta or in the imaginary commonwealths of Plato and Aristotle—for the purpose of liberating a privileged caste of citizens from ordinary economic employments and preoccupations, but simply as a humane substitute for the death penalty. There is no question of the free citizens of Utopia being a parasitic dominant class; for they all do an honest day's work with their own hands (ch. vi). Nor is More obsessed, as Plato and Aristotle are, by Malthusian anxieties. In Utopia, there is no artificial postponement of marriage. The marriageable age is 18 for women and 22 for men (ch. viii), and an occasional surplus of population is looked upon as a normal phenomenon which is all in the day's work. When the problem of over-population arises in Utopia, it is solved by colonization overseas in under-populated territories where Utopian settlers can find new homes for themselves without having to evict the previous inhabitants (ch. v, *ad init.*).

It will be seen that More's Utopia differs from its Hellenic predecessors and from its modern Western successors alike in being almost wholly free from those elements of caste and specialization and static social rigidity which are the outstanding characteristics of Utopias as a class. This is really extraordinary when we bear in mind that while Sir Thomas More welcomed the renaissance of Hellenic culture in the Western Society of his age, he deplored the simultaneous transition of the Western Society out of its 'medieval' into its 'modern' phase. A social metamorphosis which, in our perspective, can be seen to have been no more than the passage from one chapter to the next chapter in the same Western story, must have seemed to More, living in the midst of it, very like an irreparable breakdown of the Western Civilization itself in the form in which he knew it and loved it. In these circumstances, we should have expected More to write a *Utopia* of a thoroughly Platonic and Aristotelian flavour; and the fact that he actually makes his own the opposite ideal of elasticity and growth is an enigma which has to be explained. Perhaps the true explanation may be that More was sub-consciously aware of being a member of a lustily growing society all the time, notwithstanding his conscious conviction that the world in which he had grown up was falling to pieces.

¹ Bergson finds the same bent in the metaphysical as well as in the social speculations of the Platonic and Aristotelian philosophy. See the critique in *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 257-61. The 'post-war' French philosopher arraigns the 'post-war' Athenian philosophers for trying to 'peg' the flux of the Universe, as mirrored in human experience, upon the rigid scheme of the human thinking-apparatus.

² The generation now alive will not live to know whether the wound dealt to our Western Society in 1914-18 has been mortal or not, though the truth—whatever it may be—will doubtless be manifest, several centuries hence, to our descendants. On this question, see further Part XII, below.

THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS 91
had found its air and light and nourishment; and it had capped its great sin of omission—the failure to win the War—with a sin of commission—the judicial murder of Socrates—which was certainly more wanton and was naturally more heinous in the philosophers' eyes.

The first concern of the Athenian post-war philosophers was to repudiate everything that, for two centuries past, had made Athens economically and politically great. This comes out almost startlingly in a passage in Plato's *Laws*, in which the fictitious 'Athenian Stranger' makes his first observations upon an imaginary project for the establishment of a new city-state on a depopulated area in Crete.

ATHENIAN STRANGER. 'If the city were going to be built at the seaside and were going to find itself well-supplied with natural harbours but ill-supplied with many of the necessities of life instead of being endowed with a soil that produced something of everything, then it would have needed a mighty saviour and divinely inspired legislators if it was to escape the moral heterogeneity and the moral corruption which are the penalty of this type of physical environment. . . . For the sea is an insidious neighbour which makes itself agreeable to a country in the daily intercourse of the two elements but is intrinsically salt and bitter, in as much as it fills the country with tradesmen's business and the souls of the country's inhabitants with tortuousness and deceit and the body politic itself with distrust and disaffection both in its internal life and in its foreign relations. These social evils are to some extent counteracted if the soil produces something of everything; and, if it is also a rough highland country, it is evident that it will not produce this something of everything, that it does produce, in lavish quantities. If it did do that, it would provide a large export surplus and would attract to itself an equivalent import of gold and silver currency—and that is the greatest conceivable disaster, from the moral standpoint, by which a community can be overtaken. . . .¹

[As for sea power], 'it would have profited the Athenians to lose seventy times seven children a year [by having to send them as tribute to the legendary Cretan sea-lord Minos] before turning themselves [in self-defence] into seamen instead of heavy infantry and so losing the habit of standing fast, and acquiring in its place the habit of perpetually jumping ashore and then retreating to their ships again at a run, hardly a moment after they have made their landing. This method of warfare extinguishes any sense of shame at being too cowardly to risk one's life by standing one's ground and receiving the enemy's attack and suggests facile and plausible excuses for leaving one's arms in the enemy's hands and taking to one's heels—never, of course, "in disorder" but invariably "according to plan". . . . There is nothing so demoralizing for infantry in action as a hospitable fleet riding at anchor in their rear. Why, even

¹ Compare with the foregoing paragraph Aristotle, *Politics*, 1326 B-1327 A.—A. J. T.

92 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
lions, if they took to tactics of that sort, would take to running away from deer.¹

'Moreover, sea power practises a kind of inverse selection upon the manhood of a country by awarding political office as well as immunity from being killed in action to the least desirable elements. Sea power depends upon the warrant officers and petty officers and able bodied seamen; these naval ratings are a miscellaneous and not a very reputable body of men; and in such circumstances it is impossible for office to be conferred upon those who are worthy of it. Now, when once it ceases to be possible in politics to put the right man in the right place, how can a country's political life possibly remain healthy?'

CLINIAS OF CRETE. 'How indeed? Yet, all the same, Sir—Well, what about the battle of Salamis? That, after all, was a naval battle in which the Hellenes beat the barbarians; and it is our belief in Crete that this naval victory was the salvation of Hellas.'

ATHENIAN STRANGER. 'I know that is the general view both in Hellas and in the Orient. But in our belief, Sir—and by "us" I mean myself and my Lacedaemonian friend, here, Megillus—it was the land-battles at Marathon and Plataea that were the day-spring of the salvation of Hellas and the crowning mercy. And we also believe that these land victories left the Hellenes better men than they found them, but that the effect of the naval victories was in the contrary sense.'²

The unavowed but unmistakable thesis of the Platonic and Aristotelian Utopia is that Hellas could, and should, be saved by a fraternization between the discredited Athenian democracy's two arch-enemies: Athenian philosophy and the 'Lycurgeoan' system of social life which was the secret of the greatness of Sparta. If Athenian democracy had broken faith with Athenian culture, Athenian culture might still avenge its own wrongs, and save the Hellenic Civilization into the bargain, by contracting a new alliance with the rival social system which (to all appearance) had just proved its superiority over the Athenian democracy in the ordeal of battle. The Platonic and Aristotelian programme is to 'peg' the Hellenic Society at the social level of a 'Lycurgeoan' system which is to be improved in two ways: first, through being worked out to logical extremes, and, secondly, through being supplemented by the imposition of a sovereign intellectual caste, in the likeness of the

¹ Contrast the following passage in Pericles' Funeral Speech as reported by Thucydides in Book II, chs. 35-46:

'The Lacedaemonians never invade our country alone, but with the combined forces of their confederacy, whereas, when we attack our neighbours, we seldom find difficulty in defeating them, though we are the invaders and they are defending their homes. Again, our united forces have never yet been faced by any opponent, because we are continually dispersing them on expeditions by land, in addition to the requirements of our fleet. Yet, whenever they encounter a fraction of our forces and defeat them, they boast that they have been victorious against our total strength, while, if they are worsted, they maintain that it has taken our total strength to secure the victory.'

² Plato, *Leges*, Bk. IV, *ad imit.*, 704 A-707 C. The whole passage reads almost like a deliberate rejoinder, point for point, to the eulogy of Athens in Pericles' Funeral Speech as reported by Thucydides in Bk. II, chs. 35-46.

Athenian philosophers themselves, upon a military caste which is to be created in the image of the Spartiate 'Peers', but is to be taught, in the Utopian orchestra, to play second fiddle.¹

In Plato's mind, the enthronement of the philosophers in the seats of the mighty is the great thing.

'Unless . . . either the philosophers receive royal authority in the states of Hellas or the present so-called kings and sovereigns take to philosophy, and take to it genuinely and thoroughly; and unless there is a personal union between these two things, political power and philosophy; and unless the majority of the personalities which at present enter upon the one career and upon the other are forcibly excluded from entry: unless these conditions are fulfilled there cannot possibly be any cessation of evils . . . for the states of Hellas, nor indeed, in my opinion, any for the Human Race.'²

Yet even in Plato's *Republic*, and *a fortiori* in Plato's *Laws* and in the last two books of Aristotle's *Politics*, the dry bones of 'Lycurgian' Sparta stick out gauntly through the tender Athenian philosophic skin. In their condonation of caste, in their penchant towards specialization, and in their passion for establishing an invincible equilibrium at any price, the Athenian philosophers of the fourth century B.C. show themselves docile pupils of the Spartan statesmen of the sixth.

In the matter of caste, the thought of Plato and Aristotle is tainted with that Racism³ which has been one of the besetting sins of our own Western Society in its modern age, but which is something alien from the Hellenic genius. Plato's conceit of 'the Noble Lie'⁴ is a delicate device for suggesting the notion that, between one human being and another, there may be physical and psychic differences of such degree and such importance as to constitute a diversity of morphological type of the same order as the diversity between human beings and animals or between different animals of diverse species. This notion is worked out in more prosaic and therefore more brutal terms in Aristotle's discussion of the moral basis of the institution of Slavery.

'When any human beings . . . differ in nature from their fellows by as wide a remove as bodies from souls and animals from humanity (and this is the case with human beings whose utility lies in bodily labour exclusively, and that is the best that can be got out of them), then such individuals may be identified as natural-born slaves (*φύσει δοῦλοι*). . . .

¹ The second of these two improvements was first worked out 'in real life' by the 'Osmanlis, who certainly knew nothing at all about the social institutions of Sparta and probably very little about the social theories of Plato. (See pp. 33 and 50, above.)

² Plato, *Republic*, Bk. V, 473 C-D.

³ For Racism see Part II. C (ii) (a) 1, vol. i, above.

⁴ Plato, *Republic*, Bk. III, 414 B-D. The passage will be found in translation in II. C (ii) (a) 1, vol. i, on pp. 247-8, above.

94 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS

The natural-born slave is . . . a human being who participates in the rational faculty to the extent of being responsive to it without being capable of exercising it. The other animals are not even responsive to reason but are governed by their sensations. However, this makes little difference from the utilitarian standpoint. For bodily contributions towards the performance of elementary social service are what we obtain from both alike—from human slaves and from domestic animals. It is the intention of Nature to establish a morphological difference between the bodily types of freemen and slaves, corresponding to the differentiation between their functions. . . . But in actual fact the opposite frequently occurs, and one finds slaves with freemen's bodies and even slaves with freemen's souls. [These exceptions to the rule obscure the truth]; for it is manifest that if even the merely bodily diversity were of the same order as the diversity between the statues of the Gods and the physique of mortals, then the enslavement of the physically inferior type to the physically superior type would be universally approved by public opinion. And if this is true in the case of bodily diversity, the same distinction could be drawn with far more justice if the diversity were spiritual. But of course it is not so easy to discern spiritual as it is to discern physical beauty. . . .¹

Aristotle goes on to expound the arguments of the anti-slavery party in the Hellenic World of his day, and notes their refusal to admit that any human beings should be called slaves except barbarians. But, in recording this exception, he not unfairly comments that it is tantamount to accepting the hypothesis of 'the natural-born slave' which Aristotle himself has put forward.

On the strength of this social theory, the Athenian social reformers prescribe a caste-system which reproduces or caricatures almost all the 'Lycurgeoan' idiosyncrasies. Plato's 'human watch-dogs'² are reproductions of the Spartiate 'Peers' and anticipations of the Ottoman Pādishāh's slave-household, while Aristotle's prescription is indistinguishable from the Laconian reality.

'Tillers of the soil and artisans and all the other elements of a labour force are indispensable necessities in commonwealths, but the only true members of the body politic are the military and the statesmen. The division between these three castes is absolute as between the labour force and the other two, but not impassable as between these other two *vis-à-vis* one another.'³

In the philosophers' precepts on specialization, their 'Lycurgeoan' inspiration obtrudes itself, if possible, still more clearly. 'Human

¹ Aristotle, *Politics*, Bk. I, 1254 B.

² For a sketch of these 'human watch-dogs', see *Republic*, Bk. II, 375 A-376 B; and Bk. III, 416 A-C.

³ Aristotle, *Politics*, 1329 A 35-9. Aristotle rejects Plato's prescription of an intellectual governing caste which is to be segregated from the military caste *ab initio* and to exercise authority over it at all times (an idea which Plato rightly believed to be the most important contribution in the *Republic* to Hellenic social philosophy). Aristotle is content to recruit his senate from time-expired soldiers.

watch-dogs' are to be bred by compulsory selective mating, just like literal dogs and horses and poultry and other domestic animals;¹ and in the *Republic* Plato goes so far as to abolish outright the institutions of marriage and the family,² which 'Lycurgus' had been content to leave in existence at Sparta when once he had ensured that they should not interfere with the efficient working of his system. Children, both male and female, are to be kept in communal crèches from the outset—even before they are weaned—³ instead of being allowed to grow up at home as Spartan boys were allowed until the end of their seventh year and Spartan girls more or less until they were given in marriage.⁴ Private property is to be abolished:⁵ a great leap in the dark beyond the rudimentary collectivism of 'Lycurgeoan' Sparta, where, as we have seen, private property was jealously preserved and was distributed ever more unequally in spite of the socialistic endowment of every Spartiate 'Peer' with a state-owned allotment of real property, and in spite of the custom by which the 'Peers' made free with one another's hounds and horses, as well as with the stores in their hunting-lodges out in the country (in the same spirit in which English 'public-school' boys 'borrow' one another's bicycles and cricket-bats).⁶ The soldier who is to be the finished product of this social system is to be as professional in his soldiering as an artisan is in his trade.⁷ The 'human watch-dog' cannot and will not be happy; but his personal happiness is of no account; for the individual human being exists, not for his own sake, but in order to promote the welfare of the commonwealth of which he is a member.⁸ His function is to be a part of a corporate social whole; and the metaphor of the 'body politic' is to be translated, as far as may be, into a reality. The human cells of Leviathan are to be subordinated, on theory, to the social pseudo-organism as the protoplasmic cells of a human body are subordinated in fact to the genuine organism in which they cohere. 'A commonwealth approaches constitutional

¹ Plato, *Republic*, Bk. V, 459 A-460 B; cp. Aristotle, *Politics*, 1334 B-1336 A.

² Plato, *Republic*, Bk. V, 457 C-D.

³ Plato, *Republic*, Bk. V, 460 B-D. For Aristotle's precepts on the rearing of children, see *Politics*, 1336 A-1337 A.

⁴ It is, of course, only logical that, in the *Republic*, the upbringing of girls is to be socialized as thoroughly as that of boys; for (as we have noted already by anticipation) women are to be just as eligible for becoming 'watch-dogs' as men; and since they are to have the same duties, they must obviously have the same education to prepare them for this. For this complete abolition of the social inequality between the sexes, which of course goes far beyond the status accorded to women at Sparta, see Plato, *Republic*, Bk. V, 451 D-457 B, and the burlesque anticipation of this Platonic theme in Aristophanes' *Ecclesiazusae*.

⁵ Plato, *Republic*, Bk. III, 416 D-417 B.

⁶ For this custom among the Spartiate 'Peers', see Xenophon, *Lacedaemoniorum Respublica*, ch. vi, and Aristotle, *Politics*, 1263 A, 35-7.

⁸ Plato, *Republic*, Bk. IV, 419 A-421 C.

96 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
perfection in so far as it approximates to the constitution of a single human being.¹

Not happiness and not progress, but stability, is the Alpha and Omega of the Athenian philosopher's social creed. Aristotle, in his matter-of-fact way, envisages this much-desired social stability statistically. There is an optimum size both for the population of a commonwealth² and for its territory;³ and, in his anxiety to keep his population stable at the optimum figure, Aristotle allows his train of thought to carry him so far out of range of practical possibilities that he actually prescribes a difference of nearly twenty years between the respective statutory marriageable ages for women and for men. His women are to marry at 18 and his men at about 37, in order that the son (who is presumably to be an only son in every case) may not approach the statutory marriageable age in his turn until his father is conveniently ready to die off and make room for an heir to step into possession of the family allotment!⁴

In this fantastic prescription, Aristotle is consciously departing from the practice of 'Lycurgus'; for in 'Lycurgeoan' Sparta there was no regulation of the Spartiate population on economic considerations. When Spartiate male infants were destroyed, they were destroyed solely on eugenic grounds; and, as we have seen,⁵ the 'Lycurgeoan' State—like the Fascist State in our own society—deliberately encouraged Spartiate fathers to rear as many sons as they could, so long as the boys were physically fit. In commenting on the 'Lycurgeoan' social policy, Aristotle points out⁶ that the breeding of the largest attainable number of adult Spartiate males in a commonwealth which only disposed of a rigidly limited number of land-allotments for the endowment of Spartiate 'Peers' was bound to produce a pauper surplus of Spartiate male population. This residue of disinherited citizens, who had been disappointed of their natural expectations, and had been condemned to live in poverty and idleness through no personal fault of their own, would evidently be prone to revolution; and, as a grave and standing menace to the stability of the 'Lycurgeoan' constitution, their existence at Sparta strikes Aristotle as a palpable flaw in the 'Lycurgeoan' system. Accordingly, when he comes to offer his own prescription for a stable society, he makes a heroic effort to prevent this particular flaw from arising. He does not realize that, even if his scheme for keeping his population at one absolutely constant figure were feasible, his very success in carrying the pursuit of stability to this

¹ Plato, *Republic*, Bk. V, 462 c. For a critique of this conception of the relation between individual human beings and human societies, see III. C (ii) (a), below.

⁶ Aristotle, *Politics*, Bk. II, 1270 B.

extreme would remorselessly defeat its own object by extinguishing the last spark of his imaginary commonwealth's vitality. The Spartan statesmen who had created the 'Lycurgeoan' system some two centuries earlier had been wiser in their generation. They can scarcely have been unaware of the gravity of the menace to which the 'Lycurgeoan' constitution was, and always would be, exposed on account of the Spartiate 'Inferiors' inevitable revolutionary proclivities; but we may conjecture that they called this disinherited caste into existence with their eyes open. They realized that, if Sparta was to live at all, she must have a reservoir of man-power; that if this was an absolute social necessity, it could not be purchased at too high a social price; and that an element of pressure and elasticity might be not merely a necessary evil, but even perhaps an indispensable good in a social system that was otherwise altogether rigid and static.

So much for Aristotle's pursuit of social stability through statistical ingenuities. And as for Plato, who follows his own bent by pursuing this same Utopian aim on the plane of intellect and imagination, he involves himself in proclaiming a ban upon poets which might have issued from the mouth of a Spartan Overseer, and in establishing a general censorship over 'dangerous thought' which has its analogues, in the Westernized World of to-day, in the obscurantist regulations of Communist Russia and National-Socialist Germany and Fascist Italy and Militarist Japan.¹

The Utopian programme of the fourth-century Athenian philosophers was a forlorn hope, for the 'Lycurgeoan' system, in which they put their trust, was visibly crumbling at the very time when they were seeking to arrest the incipient decline of the Hellenic Civilization by 'pegging' it to the Spartan rock. The philosophers' failure was proved in a general way retrospectively by the continuance of the decline, which persisted, with alternate rallies and relapses, until, some eight centuries after 'the beginning of evils' in 431 B.C., it ended in an irretrievable fall.² But the inadequacy of this kind of Utopia for the salvation of Hellas was also demon-

¹ For the Platonic censorship of Literature, see *Republic*, Bk. III, 306 A-398 B; and Bk. X, 595 A-608 B; *Laws*, 663 D-664 D. The touches of whimsical Platonic humour with which the heaviness of the passages in the *Republic* is skilfully relieved should not be interpreted as implying that the policy here set forth is not intended by Plato to be taken seriously by his readers. For the Platonic censorship on the expression of private opinion in matters of morality and theology, see *Laws* 662 B-663 A and 907 A-910 E. In the last of the passages here cited, the atheist who preaches his atheism without malice aforethought is condemned to confinement in a reformatory for a minimum period of five years, with death as the penalty for invincible ignorance. The wilful propagandist of atheism is condemned to solitary confinement for life. For the restriction upon travel and migration, see *Laws* 949 E-953 E. On the whole subject of Plato's authoritarianism and obscurantism, see Livingstone, R. W.: *The Greek Genius and its Meaning to Us* (Oxford 1912, Clarendon Press), pp. 186-90.

² For the rhythm of declines and falls, see Parts V and XI, below.

98 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS

strated experimentally, before Hellenic history had run its course, by the mass-production of artificially manufactured commonwealths in which the main Utopian precepts were duly translated into practice. The single commonwealth laid out on a patch of waste land in Crete, which is postulated in Plato's *Laws*, was actually magnified tenfold and multiplied a thousandfold in the city-states which were founded by Alexander and the Seleucidae in *partibus Orientalium* and by the Romans in *partibus Barbarorum* during the next three or four centuries. In these 'Utopias in real life', which were systematically planted, by Hellenically enlightened rulers, over a zone extending from Transoxania and the Panjab at one end to Gaul and the Maghrib at the other, the social order was founded on the dogma, first ventilated by Aristotle, that all non-Hellenes were 'natural-born slaves'. Accordingly, the little bands of Greeks and Macedonians and Italici who were fortunate enough to be enrolled as colonists were liberated for their high cultural task of making the light of Hellenism shine in the outer darkness by having assigned to them an ample labour-force of 'Native' fallāhīn to do the dirty work of providing their new Hellenic masters with the necessary means of material livelihood. In accordance with the Aristotelian precept,¹ these hewers of wood and drawers of water were 'in' but not 'of' the commonwealths to which they were high-handedly 'attributed' and whose existence their labours rendered possible. The 'attributions' were sometimes made on what was—from the standpoint of the privileged citizen-body—a princely scale. A Roman colony in Gaul might be endowed with the entire territory and population of a barbarian tribe or canton; a Seleucid colony in Anatolia with a score of villages which had previously supported the priesthood of a temple-state.²

¹ There is no evidence to show how far the Hellenic colonization policy of the Alexandrine and post-Alexandrine age was consciously influenced by the precepts of the fourth-century Athenian philosophers. The Seleucid and the Roman foundations had precedents, in the enserfment of the Sikels and the Mariandyni to the older Hellenic colonies of Syracuse and Heraclea Pontica, which are likely to have been more prominent in the minds of the Roman and Seleucid statesmen, when they were working out their policy, than either 'Lycurgeoan' Sparta or the Athenian Utopias.

² For example, the city-state of Nemausus (Nîmes), which was organized by the Roman authorities in the territory of the Volcae Arecomici in the Roman Province of Gallia Narbonensis, received 'the Latin franchise' (an intermediate status between subjection and the Roman citizenship) and at the same time had twenty-four native Arecomican villages 'attributed' to it. (Strabo, Bk. IV, pp. 186-7.) Again, 'Antioch-towards-Pisidia . . . was probably carved out of the once vast estate of [the Anatolian divinity] Mén Askainos' by the Seleucidae (Tarn, W. W.: *Hellenistic Civilisation* (London 1927, Arnold), p. 116). In general, see Tarn, op. cit., ch. 4, *passim*; Beloch, K. J.: *Griechische Geschichte*, 2nd ed., vol. iv, part (i) (Berlin and Leipzig 1925, de Gruyter), ch. 7: 'Die Hellenisierung des Ostens'; Reid, J. S.: *The Municipalities of the Roman Empire* (Cambridge 1913, University Press). Interesting light is thrown upon the relations between 'attributed' tribes and Roman municipalities by the accident which has preserved for us the text of an edict, promulgated in A.D. 46 by the Emperor Claudius, *De Civitate Anaunorum* (translation and commentary in Hardy, E. G.: *Roman Laws and Charters* (Oxford 1912, Clarendon Press)). Compare the present relation between European immigrants and native Africans in the British territory of Kenya Colony.

A broad servile foundation was certainly needed; for the Hellenic city-state of the decadence, with its fine public buildings and its handsome public 'dole' in kind (free bread and free entertainments), was a costly affair—especially when it was arbitrarily and suddenly imposed as a superstructure upon an alien system of society which was already complete in itself. The calculation was that this costly Hellenic superstructure would ultimately pay its way by raising the whole standard of life—economic, as well as political and cultural—of the entire population throughout the vast area over which these seeds of Hellenism were being sown. But this calculation left out of account the blighting effect of the parasitism which was inherent in the Roman and Seleucid performance, as it was in the Platonic and Aristotelian programme. This fatal vice prevented the great experiment from producing the results which its authors had expected of it.¹ The weight of the parasitic Hellenic superstructure merely depressed the level of 'Native' life without penetrating beneath the surface and loosing the great deeps; and there was therefore no release of new social forces that was in any way comparable to the emergence of the titanic forces of Democracy and Industrialism from the depths of our own modern Western Society towards the close of the eighteenth century of the Christian Era.

In the second century of the same era—when the Hellenic World was enjoying an Indian Summer which contemporaries, and even posterity, long mistook for a Golden Age—it looked superficially as though Plato's most audacious hopes had at last been fulfilled and transcended. From the accession of Nerva in A.D. 96 to the death of Marcus Aurelius in A.D. 180, a series of philosopher-kings sat, in unbroken succession, upon a throne which dominated not merely this or that single Hellenic city-state but the entire Hellenic World of that age. A thousand city-states were living side by side, in peace and concord, under this philosophic Imperial aegis; yet the cessation of evils was only a pause, for all was not well beneath the surface. An impalpable censorship—inspired by the atmosphere of the social environment more effectively than it could ever have been imposed by Imperial fiat—was now eliminating intellectual and artistic originality with a vengeance which would have devastated Plato if he could have returned to see his whimsical precepts so literally realized. And the uninspired respectable prosperity of the second century was followed by the chaotic passionate misery of the third, when the fallāhīn turned and rent their masters.² By the

¹ Contrast the social effect of the previous Greek maritime colonization in the Mediterranean and the Black Sea (eighth to sixth centuries B.C.), which has been touched upon on pp. 51-2, above.

² See Rostovtzeff, M.: *The Social and Economic History of the Roman Empire* (Oxford 1926, Clarendon Press), *passim*.

fourth century the tables had been completely turned; for the once privileged ruling class of the Roman municipalities, so far as it survived at all, was now everywhere in chains. Chained to their kennels, and with their tails between their legs, the municipal decurions of the Roman Empire *in extremis* could hardly be recognized as the ideological descendants of Plato's magnificent 'human watch-dogs!'

The same pursuit of stability and the same achievement of sterility reappear in the *Brave New World* which has been conceived, in a satirical vein, by Mr. Aldous Huxley.¹

Like the Hellenic Utopias which we have just been surveying, this modern Western Anti-Utopia bears the marks of its place and its time. Written in England and published in the fourteenth year after the Armistice of the 11th November, 1918, it carries the scars of the Great War of 1914-18 and the Great Economic Depression which had begun in 1929. The author portrays an imaginary future generation of our Western Society which is content to sacrifice originality and progress if it can save itself from being destroyed by the terrific new forces of Industrialism and Democracy from which the War and the Depression have emanated.

'The Nine Years' War, the great Economic Collapse. There was a choice between World Control and destruction; between stability and . . .²

"Stability," said the Controller, "stability. No civilisation without social stability. No social stability without individual stability." His voice was a trumpet. Listening, they felt larger, warmer.

'The machine turns, turns and must keep on turning—for ever. It is death if it stands still. A thousand millions scabbled the dust of the Earth. The wheels began to turn. In a hundred and fifty years there were two thousand millions. Stop all the wheels. In a hundred and fifty weeks there are once more only a thousand millions; a thousand thousand thousand men and women have starved to death.

'Wheels must turn steadily, but cannot turn untended. There must be men to tend them, men as steady as the wheels upon their axles, sane men, obedient men, stable in contentment.

'Crying: My baby, my mother, my only, only love; groaning: My sin, my terrible God; screaming with pain, muttering with fever, bemoaning old age and poverty—how can they tend the wheels? And if they cannot tend the wheels. . . The corpses of a thousand thousand thousand men and women would be hard to bury or burn.'³

The programme of *Brave New World* (a programme which is displayed by the author in order to repel and not in order to attract) is to 'peg' our 'post-war' Western Society at the level of the Industrial System, which is to be improved, like the 'Lycurgeoan'

¹ Huxley, Aldous: *Brave New World* (London 1932, Chatto and Windus).

² Huxley, *op. cit.*, p. 56.

³ Huxley, *op. cit.*, p. 48.

system in the Athenian Utopias, and this again in two ways. In *Brave New World*, the application of our Western Physical Science to practical life is to be carried to extremes; and at the same time the vast increase in the material 'drive' behind all our actions is to be counteracted and rendered innocuous by converting the spiritual voltage of Human Nature from high to low tension. In the imaginary extensions of Applied Science—'Ectogenesis'¹ and 'Hypnopædia'²—we are given the same sensation of superhuman skill and ingenuity that we experience in real life when we contemplate the *tours de force* of the Esquimaux and the Nomads and the Spartans and the 'Osmanlis. In the relaxation of the nervous system of *Homo Industrialis* from the *furor Americanus* to the lotus-eaters' tempo,³ we are reminded of the latter end of the Polynesians.

The difficult scientific enterprise of obtaining and maintaining a low degree of spiritual tension is executed in *Brave New World* by an ingenious variety of means. In the synthetic drug called 'soma', which has the same opiate effect as the legendary lotus fruit, the aid of Applied Physical Science is enlisted;⁴ but for the most part the desired psychic effect is induced by psychological methods. The pre-Utopian social heritage of our Western Civilization is consigned to oblivion by a Burning of the Books.⁵ The possibility of fresh spiritual creation is ruled out by the elimination of challenges⁶ and of all the higher forms of spiritual activity and experience.⁷ The personality of the individual is subordinated to the corporate life of the body social to a degree that would satisfy Plato himself.⁸ And the majority of individuals are so cultivated⁹ that they perform the function for which they have been designed without any discomfort or any repining or even any consciousness that human life has other potentialities than those which they find within their own reach.

¹ Huxley, *op. cit.*, ch. i.

² Huxley, *op. cit.*, pp. 27-32.

³ For the fable of the lotus-eaters, see II. D (i), vol. ii, pp. 22-3, above.

⁴ For 'soma', see Huxley, *op. cit.*, p. 63.

⁵ This idea is taken, of course, from the legendary act of the Emperor Ts'in She Hwangti, the founder of the Sinic universal state; but it may be noted that, in the author's own generation, a similar act of vandalism had been performed for a similar purpose by a living dictator. The desire to make a breach with the Ottoman cultural past was one of the motives in the mind of President Mustafa Kemal when he substituted the Latin for the Arabic Alphabet in Turkey in A.D. 1928. Since the publication of Mr. Huxley's fantasia, there has been an actual Burning of the Books in Germany, to celebrate Herr Hitler's advent to power.

⁶ "Consider your own lives", said Mustafa Mond: "Has any of you ever encountered an insurmountable obstacle?" The question was answered by a negative silence.' (Huxley, *op. cit.*, p. 51.)

⁷ 'You can't make tragedies without social instability' (*op. cit.*, pp. 259-60). The price of happiness is the renunciation of Art and Science and Religion (p. 271).

⁸ The official motto of the World State is 'Community, Identity, Stability' (*op. cit.*, p. 1). Its slogans are 'Everyone belongs to everyone else' (p. 45) and 'When the individual feels, the community reels' (p. 109).

⁹ 'Cultivated' is the right word; for when life is reproduced by 'Ectogenesis' and birth is replaced by 'decanting', the distinction between the two successive processes of breeding and rearing fades out.

The method of operation by which the inhabitants of the Brave New World are brought into perfect equilibrium with their environment is the deliberate differentiation of Society into a number of separate castes with different social functions; and this is triumphantly achieved by the application of Physical and Psychological Science.

'Of course they did not content themselves with merely hatching out embryos: any cow could do that. "We also predestine and condition. We decant our babies as socialised human beings, as Alphas or Epsilons, as future sewage workers or future. . . ."

"I suppose Epsilons don't really mind being Epsilons." . . .

"Of course they don't. How can they? They don't know what it's like being anything else. We'd mind, of course. But then we've been differently conditioned. Besides, we start with a different heredity."

"I'm glad I'm not an Epsilon," said Lenina, with conviction.

"And if you were an Epsilon," said Henry, "your conditioning would have made you no less thankful that you weren't a Beta or an Alpha." . . .

"I was wondering", said the Savage, "why you had them at all—seeing that you can get whatever you want out of those bottles. Why don't you make everybody an Alpha Double Plus while you're about it?"

'Mustafa Mond laughed. "Because we have no wish to have our throats cut," he answered. "We believe in happiness and stability. A society of Alphas couldn't fail to be unstable and miserable. Imagine a factory staffed by Alphas—that is to say by separate and unrelated individuals of good heredity and conditioned so as to be capable (within limits) of making a free choice and assuming responsibilities. Imagine it!" he repeated.

'The Savage tried to imagine it, not very successfully.

"It's an absurdity. An Alpha-decanted, Alpha-conditioned man would go mad if he had to do Epsilon Semi-Moron work—go mad, or start smashing things up.² Alphas can be completely socialised—but only on condition that you make them do Alpha work.³ Only an Epsilon

¹ Huxley, *op. cit.*, p. 14.

² This, of course, was the state of mind of the Spartiate 'Inferiors' (*ὑπομέλως*). The Directors of the World State in *Brave New World* are saved from this Spartan problem by their superior command of Physical Science; for there is no need to maintain a reserve-force when any number of individuals required in any given caste can be cultivated artificially according to plan, and when no provision has to be made against unforeseen casualties through either war or disease.—A. J. T.

³ The spiritual 'make-up' of Alphas is the crux of the social system. 'Alphas are so conditioned that they do not *have* to be infantile in their emotional behaviour, but that is all the more reason for their making a special effort to conform. It is their duty to be infantile, even against their inclination' (p. 114). On one occasion a very high official, who is an Alpha *ex hypothesi*, confesses in an unguarded moment that 'Happiness is a hard master—particularly other people's happiness. A much harder master, if one isn't conditioned to accept it unquestioningly, than truth' (p. 268). In this Alpha mentality we detect the inevitable residual element of instability which defies elimination in *Brave New World* as in every other Utopia. The Alphas are as indispensable to Mr. Huxley's imaginary commonwealth as the servile labour force is to Aristotle's. And it can be foreseen that, sooner or later, they too will turn and rend the system that is exploiting them.—A. J. T.

can be expected to make Epsilon sacrifices, for the good reason that for him they aren't sacrifices; they're the line of least resistance. His conditioning has laid down rails along which he's got to run. He can't help himself; he's foredoomed. Even after decanting, he's still inside a bottle—an invisible bottle of infantile and embryonic fixations. . . ."

"The Savage sighed profoundly.

"The optimum population," said Mustafa Mond, "is modelled on the iceberg—eight-ninths below the water line, one-ninth above."

"And they're happy below the water line?"

"Happier than above it. . . ."

"In spite of that awful work?"

"Awful? They don't find it so. On the contrary, they like it. It's light, it's childishly simple. No strain on the mind or the muscles. Seven and a half hours of mild, unexhausting labour, and then the soma ration and games and unrestricted copulation and the feelies. What more can they ask for?"

What more indeed? And the ingeniously contrived result is an imaginary Western universal state in the likeness of the historic Roman Empire in the age of the Philosopher-Kings after the Augustan failure of nerve, or in the likeness of the Sinic Empire under the Prior Han after Ts'in She Hwangti had delivered 'the knock-out blow' in the internecine warfare of the Contending States. In *Brave New World*, likewise, an unnerved society is bidding for stability by consenting to the sacrifice of everything that makes stability worth having. It has accepted the verdict that 'Civilisation is sterilisation';² but the historical parallels indicate that no amount of self-mutilation will avail to placate the Envy of the Gods who hold the keys of immortality. 'For whosoever will save his life shall lose it.'³

While Mr. Aldous Huxley's *Brave New World* is a satirical exercise of wisdom after the event, the genius of Mr. H. G. Wells has contrived, in *The First Men in the Moon*,⁴ to write a 'post-war' Utopia thirteen years before the outbreak of the War of 1914-18. Without waiting to be enlightened by this portentous catastrophe, Mr. Wells appears to have divined by intuition that our Western Civilization was rushing down a steep place into the sea. He perceives that the social climate of Industrialism is threatening to become as inimical to Life as the physical climate of the Moon; and he presents a programme for 'pegging' our terrestrial society at a habitable level in the adverse environment of a thoroughly industrialized world in the guise of an imaginary description of actual lunar conditions.

¹ Huxley, *op. cit.*, pp. 87, 262, 264.

² Huxley, *op. cit.*, p. 127.

³ Matt. xvi. 25. The illusion of immortality, which is one of the regular psychological idiosyncrasies of universal states, is examined further in Part VI, below.

⁴ Wells, H. G.: *The First Men in the Moon* (1st ed.: London 1901, George Newnes).

The physical climate of the Moon has become so adverse to Life that the star's surface has ceased to be habitable except intermittently. Mr. Wells portrays his Selenites as being content if they can 'peg' their Selenite Society a point or two above the death-line. And, in the genuine Utopian vein, he imagines them seeking survival through stability, stability through differentiation of social functions, and differentiation through physical and psychic polymorphy.

'In the Moon, every citizen knows his place. He is born to that place, and the elaborate discipline of training and education and surgery he undergoes fits him at last so completely to it that he has neither ideas nor organs for any purpose beyond it. . . . If, for example, a Selenite is destined to be a mathematician, his teachers and trainers set out at once to that end. They check any incipient disposition to other pursuits, they encourage his mathematical bias with a perfect psychological skill. His brain grows, or at least the mathematical faculties of his brain grow, and the rest of him only so much as is necessary to sustain this essential part of him. At last, save for rest and food, his one delight lies in the exercise and display of his faculty, his one interest in its application, his sole society with other specialists in his own line. His brain grows continually larger, at least so far as the portions engaging in mathematics are concerned; they bulge ever larger and seem to suck all life and vigour from the rest of his frame. His limbs shrivel, his heart and digestive organs diminish, his insect face is hidden under its bulging contours. His voice becomes a mere stridulation for the stating of formulae; he seems deaf to all but properly enunciated problems. The faculty of laughter, save for the sudden discovery of some paradox, is lost to him; his deepest emotion is the evolution of a novel computation. And so he attains his end.

'Or, again, a Selenite appointed to be a minder of mooncalves is from his earliest years induced to think and live mooncalf, to find his pleasure in mooncalf lore, his exercise in their tending and pursuit. He is trained to become wiry and active; his eye is indurated to the tight wrappings, the angular contours, that constitute a "smart mooncalfishness". He takes at last no interest in the deeper part of the Moon; he regards all Selenites not equally versed in mooncalves with indifference, derision or hostility. His thoughts are of mooncalf pastures, and his dialect an accomplished mooncalf technique. So also he loves his work, and discharges in perfect happiness the duty that justifies his being. And so it is with all sorts and conditions of Selenites—each is a perfect unit in a world machine. . . .'¹

The imaginary human investigator of Selenite affairs draws an eerie picture of what the Selenites have come to look like as a result of their adaptation to this lunar social régime:

'"It was an incredible crowd. Suddenly and violently there was

¹ Wells, *op. cit.*, ch. xxiv: 'The Natural History of the Selenites.'

forced upon my attention the vast amount of difference there is amongst these beings of the Moon.

"Indeed, there seemed not two alike in all that jostling multitude. They differed in shape, they differed in size, they rang all the horrible changes on the theme of Selenite form! Some bulged and overhung, some ran about among the feet of their fellows. All of them had a grotesque and disquieting suggestion of an insect that has somehow contrived to mock humanity; but all seemed to present an incredible exaggeration of some particular feature: one had a vast right fore-limb, an enormous antennal arm, as it were; one seemed all leg, poised, as it were, on stilts; another protruded the edge of his face-mask into a nose-like organ that made him startlingly human until one saw his expressionless gaping mouth. The strange and (except for the want of mandibles and palps) most insect-like head of the mooncalf-minders underwent, indeed, the most incredible transformations: here it was broad and low, here its leathery brow was drawn out into horns and strange features; here it was whiskered and divided, and there with a grotesquely human profile. One distortion was particularly conspicuous. There were several brain-cases distended like bladders to a huge size, with the face-mask reduced to quite small proportions. . . ."

'He does not mention the ant, but throughout his allusions the ant is continually being brought before my mind, in its sleepless activity, in its intelligence and social organization, in its structure, and more particularly in the fact that it displays, in addition to the two forms—the male and female form—that almost all other animals possess, a number of other, sexless, creatures—workers, soldiers and the like—differing from one another in structure, character, power and use, and yet all members of the same species. For these Selenites, also, have a great variety of forms . . . differing in size, differing in the relative size of part to part, differing in power and appearance, and yet not different species of creatures, but only different forms of one species, and retaining through all their variations a certain common likeness that marks their specific unity. The Moon is, indeed, a sort of vast ant-hill; only, instead of there being only four or five sorts of ant, there are many hundred different sorts of Selenite, and almost every gradation between one sort and another.'¹

In this brilliant fantasy, Mr. Wells brings his gift of concrete imagination into play in order to conjure up before our mental vision a society which has actually achieved that morphological differentiation between different social castes which Aristotle—for once allowing his wish to be father to his thought—would have us believe that Nature herself has intended to establish.² It is significant that, in staging this fantasy, Mr. Wells finds it convenient to picture the creatures of which his imaginary Selenite Society is composed as belonging to a fabulous race which is a

¹ Wells, *op. cit.*, ch. xxiv: 'The Natural History of the Selenites'.

² See the passage quoted on pp. 93-4, above.

kind of 'missing link' between human beings and insects. By this artifice he diminishes the demand upon the imaginative faculty of his readers; for the conception of a definite and rigid correlation between social function and physical or mental structure is familiar to human minds apropos of the World of Insects; and therefore, if once the readers of Mr. Wells's *Utopia* can be induced to accept his suggestion of kinship between insects and human beings, they may be led on through this association of ideas to entertain, as possibly not inapplicable to their own human kind, a conception which would be not merely unfamiliar but violently repugnant if it were crudely suggested in an uncompromisingly human context.

In the life of the social insects, the morphological diversity of the social castes is, of course, the outstanding fact that strikes the mind of human observers, inasmuch as in the Human Race, Nature—*pace Aristotelis*¹—has not attempted to go further in morphological differentiation than to diversify the two sexes. In the Insect Kingdom, Nature has given freer play to her plastic faculty. In the social honey bee (*Apis*), she has taken one step beyond mere sexual dualism by differentiating the female sex into workers and queens with different forms corresponding to their different functions.² In the ants (*Formicidae*) she has gone further still; for in these insects the three primary morphological castes—workers, queens, and males—not only differ from one another in form more radically than the corresponding castes among the bees, but are further differentiated, in some genera of ants, into sub-castes which each have their own precise social functions.³ In the Carebara ant, 'the queen is several thousand times as large as the worker'.⁴ Finally, in the termites, the number of morphologically diverse castes, which in the ants is four at the highest—males, queens, workers, and soldiers—is normally five and rises in some genera of termites to as many as eight, each of which is represented by both males and females.⁵

In all these social insects, this physical phenomenon of morpho-

¹ Aristotle's thesis of a psychic dimorphism in the Human Race between a breed of natural-born masters and another breed of natural-born slaves has received a certain measure of support from a great Western philosopher in our own 'post-war' age:

'Dirons-nous . . . que dans les sociétés humaines il y a "dimorphisme", non plus physique et psychique à la fois, comme chez l'insecte, mais psychique seulement? Nous le croyons, à condition toutefois qu'il soit entendu que ce dimorphisme ne sépare pas les hommes en deux catégories irréductibles, les uns naissant chefs et les autres sujets. . . . La vérité est que le dimorphisme fait le plus souvent de chacun de nous, en même temps, un chef qui a l'instinct de commander et un sujet qui est prêt à obéir.' (Bergson, Henri: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), p. 300.)

² See Wheeler, W. M.: *Social Life among the Insects* (London, no date, Constable), p. 132.

³ Wheeler, op. cit., pp. 152 and 158-9.

⁴ Wheeler, op. cit., loc. cit.

⁵ Wheeler, op. cit., pp. 248-58.

logical diversity between different social castes is associated with a psychic vein of ruthlessness which is strongly reminiscent of the *êthos* of some of our arrested human societies: for example, the Nomads (who have instituted a polymorphic society by domesticating animals and taking them into partnership) or again the 'Osmanlis and the Spartans (who have done their best to introduce the equivalent of polymorphy into a society composed throughout of human beings by the Aristotelian device of treating some human beings as though they were 'human watch-dogs' and others as though they were 'human cattle'). Classic illustrations of the insects' ruthlessness are the annual massacre of the drones, in cold blood, by the worker-bees, as soon as the drones have fulfilled their social function of fertilizing the queen; the self-mutilation of the ants of both sexes, when they deliberately break off their own wings, after a solitary nuptial flight, in order to lead, for the rest of their lives, a terrene existence of laborious social service; and the self-sacrifice of the soldier-ants, who rise, on occasion, to the same heights of selflessness as Spartan Leonidas and his Three Hundred human warriors.

The ants' discarding of their wings is a symbolic act which typifies the genius of these arrested societies, both insect and human: the miracles which they are capable of achieving, and their still more astonishing limitations.

In the matter of achievement, the ants have risen socially, like human societies, from the economic phase of hunting to the higher economic levels of agriculture and pastoralism.¹ The ants have even acquired an inkling of the technique of Industrialism; for 'there are species of ants that use their larvae as shuttles in weaving the silken walls of their nests'.² In the bees, we admire the elegance with which they have solved the geometrical problems involved in the structure of the honeycomb. In the termites, we are impressed by the titanic scale of an architecture which, in its largest known buildings, surpasses, scale for scale, the Empire State Building at New York in height and the Great Pyramid at Gîzah in massiveness.³

Therewithal, some social insects also resemble our arrested human civilizations in the further point of preserving a certain measure of adaptability. The ants are decidedly adaptable in their nesting and feeding habits;⁴ the bees in their feeding habits and in their power of accommodating themselves to a wide range of

¹ See Wheeler, *op. cit.*, pp. 176-7, 177-9, and 181-94. For the practice of agriculture by the termites, see *op. cit.*, pp. 267-71.

⁴ Wheeler, *op. cit.*, pp. 152-4.

108 THE PROBLEM OF THE GROWTHS OF CIVILIZATIONS
variety in climate.¹ On the other hand, the termites have allowed themselves to be lulled into physical inefficiency by their very success in mastering the technique of architecture.

'With greater elaboration and solidity of nest architecture the termite colonies shut themselves off more and more from the outside world, and all the castes, except the winged males and females, lost their eyes and the tough consistency of their integument. They thus came to resemble the molluscs, crustaceans, and certain fishes and reptiles which have withdrawn within a heavy protective armour and have given up participating in the free competitive and co-operative life of their environment.'²

The distinguished student of social life among insects who wrote these lines goes on³ to compare the termites with the human inhabitants of China and Korea, in the age when these shut themselves off from the rest of Mankind and lived as 'hermit kingdoms'.⁴

Moreover, when we turn our attention from the physical to the psychic plane, we find evidence of a rigidity—induced, apparently, by a too exquisitely exact mental equilibrium—not only in the termites, but in the ants and bees as well.

The amazingly precise and delicate mental tool of instinct, with which the insects perform their wonderful feats, is believed, by at least one close observer of insect behaviour, to be a product of reason in a state of arrest. He suggests

'that instinct began in a reasoned act. That this act, through being continually repeated, tended to lose the reasoning element and to become more and more unconscious. As this process continued through generations, the mental machinery through which it worked got more indelibly engraven in the mind. And in the end it became automatic—in other words, it became instinctive.'⁵

The same observer finds, in insect instinct, the qualities of perfection and wisdom combined with the characteristic of inflexibility.

'Speaking in a broad and general sense, instinct is a force of amazing perfection. It performs acts of such precision that they sometimes seem to surpass intelligence. What can be more perfect than the spider's net with its equal angles, its uniform spirals, its nicely parallel threads? Or see the perfection in the comb of the hive-bee. Why, these creatures have solved a recondite problem. It is only a student of the higher mathematics who could determine after detailed calculations that this

⁵ Hingston, R. W. G.: *Problems of Instinct and Intelligence* (London 1928, Arnold), p. 268. This question has been touched upon already in the present Study in II. C (i), vol. i, on pp. 205-7, above.

exquisite system of waxen chambers, with their pyramids and rhombs and particular angles, was the one and only system possible to effect the greatest economy of wax. . . .

'Then, again, instinct is wise in its purpose. We [see] this particularly in the hunting-wasps. How amazingly wise it seems that a wasp can get the end of its sting into the one anatomical point that will bring about a paralysis of its prey.'¹

At the same time,

'we have seen that instinct is inflexible. It battles against every obstacle in order to fulfil its particular end. We saw how locusts marched out upon a river and allowed themselves to be drowned in millions rather than change their instinctive course. We saw butterflies lost on the Himalayan snow-line in obedience to that unswerving instinct which impelled them across the range. We saw spiders allowing themselves to be cut to pieces rather than change their instinctive device of sitting absolutely still.'²

From such inflexibility it is a short step to folly.

'Instinct, when it operates in the normal course, when it fulfils the particular purpose for which that particular instinct exists, acts with admirable wisdom and perfection. But divert that instinct from its normal course; try to turn it in some other channel; endeavour to make it do something which it was not originally intended to do, and the result is a course of action which astonishes us by its utter folly. . . .

'An insect may select the wrong species to mate with, another may lay on the wrong kind of food-plant, another may construct the wrong type of cocoon. These are errors that run through the perfection, and their result is disaster and death. . . .

'What folly, we exclaim, in all these actions! Why can't the creatures just think a little and not fall into these stupid traps? They can't do so, for the instinct that impels their actions demands fulfilment, whatever the cost. . . . Their instincts, so amazingly exact and deliberate, have been given them only for one definite end. When applied to that end they are astonishingly perfect. They act with foresight, with unerring logic, with results which seem even to surpass our reason. The wasp must keep parasites out of her cell. What does she do? Smear the cell outside with glue. The caterpillars have to keep in a procession. What do they do? Cling to a thread. The trap-door spider wants to hide its door. What does it do? Cover it with moss. How foreseeing, how logical, how wise it is! Our reason could do no better. Perhaps it could not do as well. But divert the same instinct. Alter its course. Try to make it do something else. Give the wasp an enemy other than a parasite; make the caterpillar's thread into an endless circle; take away the mossy environment of the spider. We have seen the result. Instinct goes on oblivious of such changes. Darkness takes the place of light.'³

² Hingston, *op. cit.*, p. 285.

³ Hingston, *op. cit.*, p. 281.

What is the bearing of these phenomena of insect life upon the history of Man? The observer here quoted expresses the opinion that 'we are not justified in making barriers between insect and human mentality' and that 'the minds of these humble creatures operate in the same way as the mind of Man in their main essential characteristics'.¹

'Every animal, Man included, possesses two sets of mental activity: the one instinctive, automatic, innate; the other intelligent, plastic, and acquired. These two activities are always blended. They may differ immensely in degrees of development, but they never completely separate from each other.

'The insect mind and the human mind differ mainly in the development of these two factors. Instinct predominates in the insect mind: intelligence in the mind of Man. Nevertheless, in both the Insect and Man these two factors definitely exist. But their minds have evolved along different channels. They have marched, so to speak, along diverging paths, the one developing the force of instinct, the other the force of reason. And each has brought its own type of development to an amazingly perfect degree.

'Yet the Insect, though predominantly instinctive, possesses also glimmerings of reason. Exactly the same is true of Man. Though his life is so filled with rational judgement, yet underneath are those primitive instincts. . . .'²

If our observer is right in this view of insect and human mentality and of the relation between the two, then his analysis projects a ray of light upon the problem of our arrested human civilizations. The cause of their strange and tragic arrest, at a moment when they have already issued, quick-born, from the womb of Time and are standing, alive with youthful energy, on the threshold of their life-course, may be explained, on this showing, in psychological terms as a mental reversion from the human towards the insect type of mental rhythm: from the blundering but progressive mobility of reason to the infallible but inflexible rigidity of instinct. In the life of these arrested human civilizations one prominent feature is, as we have seen, the degree to which their human members have become the slaves of habit; and the well-known process by which human habits are formed through some originally deliberate and conscious action becoming automatic as a result of repetition is manifestly analogous to the hypothetical process by which insect instincts may have arisen out of automatized acts of intelligence.³

¹ Hingston, op. cit., p. 285.

² Hingston, op. cit., pp. 287-8. Cp. Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 122-3. For the conventional view, which represents human societies as being founded on reason and insect societies as being founded on instinct, see Ibn Khaldūn: *Muqaddamāt*, translated by de Slane, Baron McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. I, p. 84.

³ This analogy is suggested, in this context, by Hingston, op. cit., pp. 266-8.

The existence of the five arrested human civilizations shows that the problem of the growth of civilizations is a genuine problem. The analogy between the human and the insect soul gives us an inkling of the nature of this growth as it is manifested in the histories of our twenty-one civilizations which have not suffered arrest but have duly gone on growing after birth.

B. THE NATURE OF THE GROWTHS OF CIVILIZATIONS

HAVING satisfied ourselves that the growths of civilizations present a problem, and having set ourselves the task of solving this problem by inquiring what the nature of these growths may be, let us start our inquiry by invoking a power which has already proved itself a very present help at another critical point in this Study. Let us call in once again the aid of Mythology.

The myth of the Book of Job and of Goethe's *Faust* has given us an insight into the nature of the geneses of civilizations.¹ We may find that equal light is thrown upon the nature of their growths by the myth of Aeschylus's Promethean Trilogy.

This line of approach to our new problem seems promising because the general structure of the two myths is the same. In both, the theme is a conflict between two superhuman powers: a conflict between Zeus and Prometheus in this case, and a conflict between God and Satan or Mephistopheles in the other. In both myths, again, the field of this superhuman conflict is a human being or human society which is also the stake for which the superhuman combatants are contending. The role of Faust or Job is played in the Aeschylean myth by the Hellenic Society, which expands, in the poet's transcendent imagination, into Mankind at large. And, lastly, in both myths, the relative importance of the human and superhuman actors, as it appears in the mythological fantasy, has to be reversed when we come to the psychological interpretation. From this introverted angle of vision, the human field of conflict or prize of victory takes substance as the sole figure on the stage, while the superhuman combatants resolve themselves into conflicting impulses in this human actor's soul.

To this extent the two myths are analogous. The difference between them lies in the relation of the two superhuman combatants—or two conflicting human impulses—with one another. In the myth of Faust and Job, it is God—the receiver of the challenge—who wins the victory through finding an opportunity, in the challenge presented by Satan or by Mephistopheles, for performing a new creative act from which God would otherwise have been inhibited by his own perfection. In this myth, the challenger—Mephistopheles or Satan—is permitted by God to persecute a human victim, in order that the persecutor may suffer discomfiture and defeat. On the other hand, in the Aeschylean myth, the re-

¹ For an analysis of this myth, see II. C (ii) (b) 1, vol. i, above.

ceiver of the challenge, who in this myth is Zeus, is the loser of the battle. For Zeus, so far from yearning to perform a creative act, is anxious to stay as he is and to keep the Universe around him at a standstill; the challenge presented to Zeus by Prometheus, which calls the temper and policy of Zeus in question, moves Zeus to inflict a vindictive persecution upon his challenger; and in this act, which overthrows his cherished equilibrium, Zeus brings about his own defeat, while Prometheus, through suffering, wins his way to victory.

When the superhuman and universal imagery of the Aeschylean drama is translated into terms of human time and place, the issue presents itself as the question whether or not the infant Hellenic Civilization is to grow. The crisis is specifically a crisis of social infancy.

'We have before us something pre-classical. We have the daring of an age that has not yet been frightened. If Euripides had said of Zeus the things that Aeschylus says there would probably have been trouble. By his time people were afraid of the solvent and destructive effects of free speculation; in the time of Aeschylus they were still looking to the powers of the human intellect, to reason and free inquiry, as the great emancipators.'¹

Aeschylus sees Zeus as he is, and therefore he sees that Zeus has to be saved, in spite of himself, by the Promethean challenge.

This Aeschylean Zeus is the primeval Zeus: a superhuman counterpart of the Achaean barbarian war-lord, with the Olympian Pantheon for his turbulent war-band.² The historical feat of the Achaeans in overrunning the domain of the outworn Minoan Civilization and making themselves masters of its debris has its mythical reflection in the legendary feat of Zeus in overthrowing his divine predecessor Cronos.³ Having accomplished this *tour de force* and mounted the throne of Olympus, Zeus has no other idea except to keep himself enthroned there, in solitary, motionless, tyrannical state, with his foot on the neck of a prostrate Universe, as the human barbarians, deposited in Crete by the 'Dorian' Völkerwanderung, actually sat upon the enserfed Minoans,⁴ and as the Nomadic invaders from the Steppes have sat upon the sedentary populations whom they have conquered in various times and places. Zeus, however, has not conquered Cronos by his own unaided

¹ Murray, Gilbert: *Prometheus Bound translated into English Rhyming Verse* (London 1931, Allen & Unwin), Introduction, pp. 8-9.

² For this aspect of Zeus, see I. C (i) (b), vol. i, p. 96, above.

³ The overthrow of Cronos by Zeus is duplicated, in the Hellenic Mythology, in the previous overthrow of Uranus by Cronos. Both Cronos and Uranus are conceived in the image of Zeus, and not in that of the Minoan godhead. (See vol. i, p. 96, above.)

⁴ See the Song of Hybrias the Cretan, quoted in Part III. A on p. 87 in footnote 1, above.

powers. He has conquered him with the help of Prometheus; and, after their joint victory, he has to reckon with his Titanic ally. But Prometheus works—and works indefatigably—for everything in life that Zeus now wishes to rule out. For Prometheus is an insatiable creator, a kindler of fire, a probing progressive mind. Prometheus is a mythical personification of the continuity of the growth-process, the Bergsonian *élan vital*. He knows that, unless Zeus keeps on the move, the new ruler of Olympus will inevitably be overthrown in his turn, like Cronos before him; and therefore he gives Zeus no peace.

In every situation, Prometheus always ranges himself on the side of thought against force, of progress against arrest.

When the Titans stand for force and Zeus for thought, Prometheus takes sides with Zeus against his fellow-Titans.

When first the immortals learned the taste of wrath,
And strife arose and between them wound its path,
Many would cast out Cronos from his throne,
That Zeus forsooth might reign, but many an one
Swore that no Zeus should e'er be lord of heaven.
Wise was I, but no force to me was given
To move the brood Titanic, born of Earth
And Sky. All crooked plans they turned to mirth
In their great hearts, and thought full easily
By strength to master all. But much to me
And oft-times had my mystic mother told—
Themis and Gaia, titles manifold
Of one eternal form—what end must fall:
That in this warfare not by strength at all,
Only by thought, the conquerors should prevail.
I spoke, I showed my brethren all the tale,
But they nor heard my words nor looked at me.
Best then I deemed it, if such things must be,
That I with Zeus, led by my mother's light,
Should stand, will linked with will, in armed fight;
And by my counsels now the deep and cold
Abyss of darkness covereth Cronos old. . . .¹

Thereafter, when Zeus seeks to make his newly won dominion secure by turning the universe into a desert and calling it peace, Prometheus remains true to his own role and thereby falls out with his late ally.

When first he mounted on his father's throne
Straightway he called the Gods, and gave each one
His place and honours. So he wrought his plan
Of empire. But of Man, unhappy Man,

¹ Aeschylus: *Prometheus Vincit*, ll. 201-22, Gilbert Murray's translation.

He had no care: he counselled the whole race
 To uproot, and plant a strange brood in its place.
 And none took stand against that evil mind
 Save me. I rose. I would not see Mankind
 By him stamped out and cast to nothingness. . . .¹

In this fresh crisis in the cosmic drama, Prometheus fails to convince Zeus by sheer reason, as he had previously failed to convince the Titans.

In every tyrant's heart there springs in the end
 This poison, that he cannot trust a friend.²

Thereupon, Prometheus sets the will of Zeus at defiance, and leads Mankind onward and upward out of the darkness of the post-Minoan interregnum into the light of the Hellenic Civilization as it had come to shine at Athens in Aeschylus's own day.

All that of art Man has, Prometheus gave.³

And he gave it by inspiring his human protégé and pupil with his own Promethean spirit:

A thing of no avail
 He was, until a living mind I wrought
 Within him, and new mastery of thought.⁴

For this thwarting of his will, Zeus takes his revenge upon Prometheus by turning against him the whole battery of his super-human force.

Mercy I had for Man; and therefore I
 Must meet no mercy, but hang crucified
 In witness of God's cruelty and pride.⁵

Therewith, Zeus reveals himself as a tyrant and a blight; and the cosmic forces—Io and Oceanus and the Chorus of the Oceanides—which had been in sympathy with Zeus in his struggle with the Titans now turn against him. But these sympathies, which are inhibited by timidity from issuing in action, are of little avail to Prometheus in his contest of wills with his Olympian antagonist.

In this contest, Prometheus is physically at Zeus' mercy. Yet the victory is in Prometheus' hands; for no torture that Zeus can inflict is able to overcome Prometheus' will-power; and this will-power guards a secret that Zeus fain would know.⁶ The secret is that, if Zeus persists in his static, tyrannical posture, he is dooming himself to be overthrown, like his predecessors, by the brute force

¹ Op. cit., ll. 230-8.

² Op. cit., ll. 226-7.

³ Op. cit., l. 506. See the whole passage, ll. 436-506, in which Prometheus reviews his labour of love for Man in retrospect.

⁴ Op. cit., ll. 443-4.

⁵ Op. cit., ll. 241-3.

⁶ Op. cit., ll. 511-25 and 907-40.

which he has deliberately enthroned in place of thought.¹ This secret is the key of Zeus' own destiny, and in the *Prometheus Vincitus*—the first, and the sole surviving, play of the Aeschylean Trilogy—we are shown Zeus trying, and failing, to wrest Prometheus' secret from him—first by the mental pressure of a threatening message delivered by Hermes and finally, at the end of the play, by the brute force of the thunderbolt.

'The other two plays of the Trilogy, *Prometheus Released* and *Prometheus the Torchbearer*, are no longer extant, but there is enough evidence to show that the end was reconciliation. Prometheus endured for the sake of Man and the oppressed Elder Gods all the pains that Zeus could inflict; also Zeus himself "learnt by suffering"² the lesson of forgiveness. He set free his old enemies, the Titans; he spared Mankind; he invented the right of the suppliant. These two elements are enough in themselves to make possible a reconciliation, but it seems certain that Aeschylus also brought in a third element. From the very beginning, Zeus was not quite what he seemed. . . .³

How was Prometheus' moral victory over Zeus attained? Was it that he stole a march on Zeus by bringing down the divine fire to Man concealed in a fire-stick or in a hollow reed? Or was it that he placed Zeus in the tactical dilemma of having to see his policy of immobility flouted or else depart from it himself in the act of taking up arms to defend it? But moral victories are not won by mental chicane; and the cause of Zeus' surrender to Prometheus assuredly lies deeper. Zeus was 'not quite what he seemed' because there was an element of his ally-adversary's spirit in him—a glimmer of Promethean light in the soul of Zeus which Zeus himself was unable wholly to extinguish. It was this that gave Zeus his inkling that Prometheus possessed a secret which was big with the tyrant's own fate, even though he could not divine what this secret was and could think of no better way of learning it than to extort it by force—until he found by trial that, for this purpose, force was unavailing. The reconciliation between Zeus and Prometheus was achieved because their conflict kindled into a flame the Promethean spark which was latent all the time in Zeus' soul.

This is perhaps another way of expressing an aspect of the relation between these two powers which we have noticed, by anticipation, above.⁴ Zeus and Prometheus, who on the plane of Mythology appear as separate superhuman personalities, are seen, in a psychological analysis, to be two impulses in a single human

THE NATURE OF THE GROWTHS OF CIVILIZATIONS 117
soul which interpenetrate one another, however vehement their conflict, because it is the same soul that feels them both.

If we apply this analysis to the souls of the men and women who were the constituents of the Hellenic Society in the days of its infancy, we may give the Aeschylean myth the following historical interpretation. Supposing that, in Hellas at large, the lethargy of the Achaean or 'Dorian' barbarians, who had squatted among the debris of the derelict Minoan World, had never been stirred by a current of Promethean mental energy, then all Hellas would have vegetated in perpetuity like 'Dorian' Crete. Or let us suppose that the Promethean challenge had been duly presented to the infant Hellenic soul, but had been answered everywhere as it was answered at Sparta. Then the Hellenic Civilization would have been arrested on the threshold of growth, in static high tension, in the Spartan vein; and Sparta, not Athens, would have been *Hellados Hellas*. If the Hellenic Society at large actually avoided both the Cretan and the Spartan fate, this was because, in a majority of Hellenic souls, during the centuries that intervened between the post-Minoan interregnum and the generation of Aeschylus (*vivebat circa* 525-456 B.C.), the humane progressive civilizing *êthos* of the mythical Prometheus prevailed over the violent 'die-hard' barbarian *êthos* of the mythical Zeus. 'Zeus was not quite what he seemed.' He seemed a mere barbarian interloper; yet he must have been something more than that; or the historical fact that the Hellenic Civilization actually grew out of an Achaean barbarian root would be an inexplicable miracle.¹

The Promethean *êlan* in the infant Hellenic Society carried it forward from genesis into growth and did not allow it to stand motionless, like a creature turned to stone, on the threshold of life until its place on the open road should be taken by another. In the Hellenic Mythology the son who is greater than his father is born by Thetis not to Zeus (the power who, when reconciled to Prometheus, stands, like God in Goethe's *Faust*, for the divine whole). Achilles is born to Peleus (who, like Faust or Job, is no more than the human part).² And thus Hellenic destiny works itself out as a process of growth within the bosom of the Hellenic Society, and not as a catastrophe in which the forces immobilized in the bosom of an arrested civilization are eventually released by the destruction of the social fabric within which they have been imprisoned, in order to clear the ground for a new attempt at construction from the foundations upwards.

¹ For the relation of the Hellenic Civilization to the Minoan Civilization through the Achaean 'external proletariat' of the Minoan Civilization, see I. C (i) (b), vol. i, pp. 95-100, and II. D (vii), vol. ii, pp. 315-16, above.

² Murray, *op. cit.*, Introduction, pp. 13-14.

The Promethean *élan* of the human intellect, which has been portrayed in mythological imagery by the Athenian poet, has been described in the corresponding terms of his own language by a modern French philosopher.

'Although we have to act only upon the objects around us, and although this was the original function of the intellect, the fact that the mechanical structure of the whole Universe is present in each of its parts has made it inevitable that Man should be born with an intellect virtually capable of embracing the whole material world. It is the same with the intellect as with the sense of sight. The eye, likewise, has been made only for the purpose of revealing to us the objects upon which we are in a position to act; but, just as Nature has not been able to obtain the desired degree of visual power except by constructing an apparatus with an efficiency in excess of its object (in as much as we see the stars, although we are incapable of exerting action on them), in the same way she has given us, of necessity, along with the faculty of understanding the matter which we manipulate, a virtual knowledge of the rest and a power—likewise virtual—to make practical use of it.'¹

The same Western philosopher has retold the Aeschylean tale of the conflict between Prometheus and Zeus.

'Man, as he issued from the hands of Nature, was a being who was both intelligent and social, with a sociality which was calculated to reach its term in diminutive societies and with an intellect which was destined to serve both the individual life and the group life. But the intellect, dilating by its own efforts, has entered upon an unexpected development. It has liberated human beings from servitudes to which they had been condemned by the limitations of their nature. Under these conditions it has proved not impossible for certain human beings, with particularly rich [psychic] endowments, to re-open that which had been closed, and to perform, at least for themselves, that which it would have been impossible for Nature to perform for Humanity at large. Their example has eventually carried away the rest of Mankind, at least in imagination. The will has its genius, as well as the intellect, and genius defies all prognostication. Through the medium of these wills inspired by genius, the *élan* of Life that traverses Matter obtains from Matter, for the future of the Human Species, promises of which there could not even have been any question at the time when the species first took shape. . . . One might say—to employ Spinoza's terms in a

¹ Bergson, Henri: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 180-1. The prologue to the Bergsonian epic of the human intellect is given in the following passage from the work of a contemporary English biologist:

'Throughout life, effort always seems to bring in its train advantages unforeseen and unconnected with the effort's immediate object. To give an extreme example, the eyes and ears and other sense-organs of animals were developed chiefly for the capture of prey and the avoidance of enemies; but, once formed, they were the starting-point for the life of consciousness that has culminated in ourselves.' (Huxley, J. S.: *The Individual in the Animal Kingdom* (Cambridge 1912, University Press), pp. 130-1.)

Compare the fable of Solomon's Choice in the First Book of Kings, iii. 5-13 (already cited in this Study in II. D (ii), vol. ii, on p. 55, above), and the histories of Venice and Holland (cited in II. D (vii), vol. ii, on pp. 260-1, above).

In Bergson's philosophy, as in the poetry of Aeschylus, the personality of Prometheus—the genius of the Human Intellect—is drawn for us with a masterly touch. Can we translate this Promethean image into terms of our own concept of Challenge-and-Response? We have found, by empirical observation, that the most stimulating challenge is a challenge of mean degree between an excess of severity and a deficiency of it.² Perhaps we can now gain deeper insight into this apparent 'law' by applying the myth of Prometheus to it. The characteristic of Prometheus is his *élan*, which carries him past the dead point at which Zeus would have stuck if Prometheus had not been there to carry Zeus away with him. And, in terms of Challenge-and-Response, the Promethean *élan* suggests a consideration which has not engaged our attention in this context so far. So far, we have simply noted the truths, or truisms, that a deficient challenge may fail to stimulate the challenged party at all, while an excessive challenge may break his spirit. But what about the challenge with which he is just capable of coping? On a short view, this is the most stimulating challenge imaginable; and, in the concrete instances of the Polynesians and the Esquimaux and the Nomads and the 'Osmanlis and the Spartans, we have observed empirically that such challenges are in fact apt to evoke *tours de force*. We have also observed, however, that in the next chapter of the story these *tours de force* exact, from those who have performed them, a fatal penalty in the shape of an arrest in their development. And, therefore, on a longer view, we must pronounce that the evocation of the greatest immediate response is not the ultimate test of whether any given challenge is the optimum from the standpoint of evoking the greatest response on the whole and in the end. The real optimum challenge is rather one which not only stimulates the challenged party to achieve a single successful response but also stimulates him to acquire a momentum that carries him on a step farther: from achievement to a fresh struggle, from the solution of one problem to the presentation of another, from momentary rest to reiterated movement, from Yin to Yang again. The single, finite movement from a disturbance to a restoration of equilibrium is not enough; if genesis is to be followed by growth. And, to convert the movement into a repetitive, recurrent rhythm, there must be an *élan* which carries the challenged party through equilibrium into an overbalance which exposes him to a fresh challenge and thereby inspires him to make a fresh response in the form of a further equilibrium ending in a further overbalance

¹ Bergson, op. cit., p. 55.

120 THE NATURE OF THE GROWTHS OF CIVILIZATIONS
—and so on in a progression which is potentially infinite. In earthly language:

So tauml' ich von Begierde zu Genuss
Und im Genuss verschmacht' ich nach Begierde.¹

In heavenly language:

Komm! Hebe dich zu höheren Sphären!
Wenn er dich ahnet, folgt er nach.²

This *élan*, working through a series of overbalances, can be detected in the course of Hellenic history from the genesis of the Hellenic Civilization down to Aeschylus's day.³

The first challenge presented to the new-born Hellenic Civilization was the challenge of chaos and ancient night. The disintegration of the 'apparented' Minoan Society had left a welter of social debris—marooned Minoans and stranded Achaeans and 'Dorians'—in the defunct society's derelict domain; and the first question was whether a new order would assert itself in this void and formless world. Would the sediment of an old civilization be buried under the shingle which the new torrent of barbarism had brought down in spate? Would the rare patches of lowland in the Aegean landscape be dominated by the wilderness of highlands which ringed them round? Would the peaceful cultivators of the plains be at the mercy of the shepherds and the brigands of the mountains?

This first challenge to the life of the infant Hellenic Civilization was victoriously met. As Hēraklēs, in his cradle, strangled the two serpents that had been sent to take his life, so the people of the lowlands of Hellas solved their problem of self-defence by establishing their mastery over their aggressive highlander neighbours; and their victory decided that Hellas should be a world of cities and not of villages, of agriculture and not of pasturage, of order and not of anarchy. Yet the very success of their response to this first challenge exposed the victors to a second. For a victory which ensured the peaceful pursuit of agriculture in the lowlands gave a momentum to the growth of population; and this momentum did not come to a standstill when the population reached the maximum density which agriculture in the Hellenic homeland could support. This limit was inelastic; for, in the Aegean World, the arable lowlands amount to only a small fraction of the total area of the country; and the line at which the bare limestone skeleton of the land breaks out, as a barren mountain-side, above the level sediment of soil in

¹ *Faust*, ll. 3249–50.

³ These chapters of Hellenic history have been dealt with, by anticipation, in I. B (i), vol. i, on pp. 24–6 and in II. D (ii), vol. ii, on pp. 36–49, above, and are examined further in III. C (i) (a) on pp. 139–40 and in III. C (i) (d) on pp. 197–8, below.

the valley bottoms is so sharp that the wayfarer passes from loam to rock, from field to wilderness, at a single step.¹ Thus the very success of the response which the Hellenic Society had made to the first challenge exposed it to a second; and it responded to this Malthusian challenge as successfully as it had responded to the Herculean.

The Hellenic response to the challenge of over-population took the form of a series of alternative experiments. The easiest and most obvious method of solving the problem was adopted first and was applied until it began to bring in diminishing returns. Thereupon, a less obvious and more difficult alternative method was adopted and applied, in place of the first, until, this time, a solution of the problem was achieved.

The first method was to employ the techniques and institutions which the lowlanders of Hellas had created in the process of imposing their wills upon their highlander neighbours at home in order to conquer new domains for Hellenism overseas. With the military instrument of the hoplite phalanx and the political instrument of the city-state, a swarm of Hellenic pioneers established a Magna Graecia in the toe of Italy at the expense of barbarian Itali and Chônes, and a new Peloponnese in Sicily at the expense of barbarian Sikels, and a Hellenic pentapolis in the Cyrenaica at the expense of barbarian Libyans, and a Chalcidicê on the north coast of the Aegean at the expense of barbarian Thracians.² Yet, once again, the very success of the response brought down a new challenge upon the victors. For the expansion of Hellas from the coasts of the Aegean far and wide around the coasts of the Mediterranean was itself a challenge to the other Mediterranean peoples—the barbarian victims and the Phoenician and Etruscan rivals of the Hellenic pioneers—whose vital interests were being jeopardized by these Hellenic successes; and eventually the non-Hellenes were stimulated by the Hellenic pressure upon them to bring the expansion of Hellas to a standstill: partly by resisting Hellenic aggression with borrowed Hellenic arts and arms, and partly by co-ordinating their own forces on a greater scale than the Hellenes themselves were able to achieve.³ Through the increasingly effective resistance of

¹ A modern Western observer cannot fail to be struck by the resemblance between the physiography of Greece and that of Japan; and the situation of the agricultural population of the Hellenic homeland in the first half of the eighth century B.C. must have been not unlike that of the agricultural population of Japan in the first half of the twentieth century of the Christian Era.

² See I. B (ii), vol. i, p. 24, and II. D (ii), vol. ii, pp. 42-3, above. For the wrong turning taken on this occasion by the Spartans, when they tried to solve the Malthusian problem by conquering their own Hellenic neighbours and peers in Messenia, see I. B (ii), vol. i, p. 24, and III. A, pp. 52-3, above.

³ It is one of the laws of the Balance of Power that it is more difficult to achieve political consolidation in the heart and centre of an expanding society than on the periphery. This law is analysed in III. C (ii) (b), on pp. 301-6, below.

these opposing forces, the Hellenic expansion over the Mediterranean, which had begun in the course of the eighth century B.C., was brought to a standstill in the course of the sixth century after having lasted for some two hundred years. Meanwhile, the Hellenic Society was still confronted by the challenge of over-population, by which its expansion had originally been set in motion; and now that one method of solving the problem had been followed out to the point of diminishing returns, some alternative method had to be discovered.

In this new crisis in Hellenic history, the required discovery was made by Athens, who became 'the education of Hellas' through learning, and teaching, how to transmute the expansion of the Hellenic Society from an extensive into an intensive process.¹ This Athenian response to the Malthusian challenge has been described already in this Study,² and the description need not be repeated here. It need only be pointed out that this Athenian response was demanded because the pre-Athenian response to the same challenge had carried the balance of forces between the Greeks and their Mediterranean neighbours beyond the dead point of equilibrium until it had eventually overbalanced into a situation in which the non-Hellenic resistance to Hellenic expansion made it necessary for the Hellenic Society to pursue the solution of the Malthusian problem by other means.

It was in the full *élan* of the Athenian response³ that the Athenian poet Aeschylus wrote his Promethean Trilogy, in which the rhythm of overbalance is captured and immortalized in a myth.

This rhythm, which thus appears in the poetry of Aeschylus as well as in the pre-Aeschylean chapters of Hellenic history, has been apprehended, in a far distant time and place, by a modern North American poet.

¹ The phenomenon of 'etherialization', of which this transmutation is an example, is examined in III. C (i) (c), below.

² In vol. i, pp. 24-5, and vol. ii, pp. 39-42, above. Compare the similar policy for solving the same Malthusian problem which was pursued by the Japanese Government from the time of the Washington Conference of A.D. 1921-2 down to the 18th-19th September, 1931. (See Toynbee, A. J.: *Survey of International Affairs, 1931* (London 1932, Milford), pp. 400-3.)

³ This time, again, the success of the response to one challenge exposed the successful society to a new challenge. The Athenians had discovered how to solve the Hellenic problem of over-population by an intensification of economic productivity through specialized production for export; and through this Athenian discovery an economic problem received a complete economic solution. But this economic solution of an economic problem at once created a political problem which could only be solved on political lines. For the economic change from a system of local autonomy to a system of intercourse and interdependence demanded a corresponding change on the political plane. An inter-city-state economy could not be carried on effectively without the provision of some kind of political framework in the shape of an inter-city-state régime of law and order. The Athenians failed to respond successfully to this political challenge which arose out of their successful response to the foregoing economic challenge, and this failure resulted in the breakdown and disintegration of the Hellenic Civilization. (See further IV. C (iii) (b) 10, vol. iv, pp. 206-14, below.)

'It is provided in the essence of things that from any fruition of success, no matter what, shall come forth something to make a greater struggle necessary.'¹

This intuition of an American man of letters of the nineteenth century has been taken as a text by a twentieth-century English biologist.

'Life can never be in equilibrium. Given the two well-established facts that living substance can vary and that living things, if left to themselves, would multiply in rapid geometrical ratio, then change in the *status quo* is inevitable. A state of equilibrium may for a time exist, but every balanced organism is as it were pressing against every other, and a change in one means a rearrangement of them all. . . .

'If one species happens to vary in the direction of greater independence, the inter-related equilibrium is upset and cannot be restored until a number of competing species have either given way to the increased pressure and become extinct, or else have answered pressure with pressure and kept the first species in its place by themselves too discovering means of adding to their independence. While the balance of power lasts, variation no doubt takes place, but there is no strong necessity to guide it. Once let a large favourable variation take place in a species, however, so giving it a handicap, and then for its competitors natural selection is at once made more active—they must perish or else adjust themselves by a variation, generally in a similar direction. So it comes to pass that the continuous change which is passing through the organic world appears as a succession of phases of equilibrium, each one on a higher average plane of independence than the one before, and each inevitably calling up and giving place to one still higher. . . .'²

The same rhythm has been detected, in both the organic and the inorganic realm of the material world, by a South African statesman (often quoted in this Study) who is at the same time a philosopher and a student of Physical Science.

'A . . . peculiar feature about the change in equilibrium in a physico-chemical structure is that it is never such as to produce a perfect new equilibrium; the new is merely approximate, just as the old equilibrium was. We may say that the change is from too little to too much. A structure remains unchanged in spite of a small change in its inner equilibrium; hence the inner instability must pass certain limits before the readjustment in equilibrium takes place. The instance of a super-saturated solution is a case in point, where the solidification or crystallization lags behind the conditions which bring it about. When the change does come, it again proceeds too far; it swings beyond the necessities of the case; it passes the limits of perfect equilibrium on to the other side, so to say. From too little adjustment it passes to too much adjustment, and again there is a condition of instability which has to be

¹ Walt Whitman, quoted by Huxley, J. S., in *The Individual in the Animal Kingdom* (Cambridge 1912, University Press), p. 114.

² Huxley, *op. cit.*, pp. 114-16.

righted by a swing back in due course.¹ Thence arises the rhythmic character of natural change, which links it on to the rhythm of the life-processes, and shows that they spring from the same source in the inner nature of things. Hence probably arise also the definite quantitative increments of change which the New Physics reveals. . . .

'We may represent an organism as a moving developing equilibrium, which is never perfectly adjusted because it has a persistent slight over-balance in the direction of development. Complete equilibrium is never attained and would be fatal if it were attained, as it would mean stagnation, atrophy, and death.'²

This philosophic and scientific intuition of the rhythm of progress is confirmed by the keen eye of the horse-breeder, which finds the same points in the build of a thoroughbred.

'The more unstable, in a forward direction, is the equilibrium of a horse's body during each step at any particular pace, the greater will be the speed that can be developed at that pace; because, the more unstable the equilibrium, the more easily can the centre of gravity be brought forward. This fact needs no mathematical investigation, for we all know that, if a person is bending forward, it is much easier to push him to the front than if he was leaning back. . . . It is evident that the chief advantage which is gained from the "crouching jockey's seat", as regards speed, is due to the fact that the forward position of the rider increases the instability of the equilibrium of the horse. . . . During continued movement, any addition to speed obtained by increased instability of equilibrium necessitates increased muscular effort in maintaining the centre of gravity of the body at a suitable height.'³

This homely illustration from the lore of horseflesh raises a question of general interest and of profound importance; for the horse, who is constrained by the instability of his equilibrium to repeat, and to go on repeating, an identic movement of his legs, is carried by this repetitive physical rhythm in a certain direction—a 'forward direction'—which is constant.⁴ Whatever the directive may be—whether it be the horse's own impulse to outstrip his competitors or the external stimulus of rein and whip and spur—its effect is to make the horse run, from start to finish, the race that is set before him.⁵ Is this element of direction an essential feature in the process of growth?

In encountering this question we shall be wise to remind ourselves that the idea of 'direction' can have no literal application

¹ Compare the *loi de double frénésie* which is enunciated, as one of the characteristic phenomena of human social progress, by Monsieur Bergson in op. cit., pp. 318-22.—A. J. T.

⁴ For an analysis of the repetitive and the non-repetitive factors in the phenomenon of Rhythm, see IV. C (i), vol. iv, pp. 34-8, below.

⁵ Hebrews xii. 1.

except in the physical world, and that we must be on our guard against going astray when we apply the same idea metaphorically in the psychic field. The movement of the *Psychê* is not 'directed', either by a deterministic push or by a teleological pull; and in the Promethean rhythm of challenge and response and recurrent challenge—or differentiation passing over through integration into differentiation again—the thread of continuity which the repetitive character of the process reveals requires a different metaphor to describe it.

'The essential [notion in] the idea of an *élan vital* [is] the impossibility of foreseeing the forms that Life creates—complete in every detail—by discontinuous leaps along the course of her evolution. If one takes his stand on the doctrine of pure mechanism or on that of pure teleology, on both hypotheses alike the creations of Life are pre-determined, since on the one hypothesis the future can be deduced from the present by a calculation, while on the other it is delineated in the present in the form of an idea—with the consequence, in either case, that Time is of no effect. Pure experience suggests nothing of the kind. "Neither impulsion nor attraction," it seems to say. . . .

'[The goal of human endeavours], which, at long intervals, has been the dream of the elect, realizes something of itself each time in acts of creation—each of which makes it possible, by a more or less profound transformation of Human Nature, to surmount difficulties that have been insurmountable up to that point. . . . Are these steps in progress all taken in one single direction? It goes without saying that the direction is the same as soon as we have agreed upon calling these movements steps in progress. Each movement will in fact then have to be defined as a step forward. But this is merely a metaphor; and if there were really a pre-existing direction along which Mankind had been content to advance, moral revivals would be predictable: the need of a creative effort for each of them would not be there. The truth is that one can always take the latest of them, define it by a concept, and say that the others contained a greater or lesser quantity of what the concept includes, and that consequently all of them were stations on the road to this. But things only take this form in retrospect. In reality, the changes were qualitative and not quantitative, and they therefore defied prediction. There was, however, one side on which they presented in themselves, and not merely in their conceptual transcripts, a factor common to them all. They were all of them attempts to open what was closed. . . . To push our analysis farther, we must add that these successive efforts were not exactly the progressive realization of an ideal, because no idea that had been forged in anticipation would be able to represent a sum of acquisitions each of which, in creating itself, would be creating a special idea of its own. Yet, all the same, this diversity of efforts might well sum itself up in something unique: an *élan*.¹

¹ Bergson, Henri: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 119-20 and 288-9.

The continuity here is not spatial but summative. As far as direction goes, the line of movement plotted out by the succession of responses may be exceedingly erratic; and, whatever shape this line may take, it has little or no symbolic significance, because the continuous progress that is achieved by the Promethean *élan*, as its response to one challenge exposes it to another challenge *und so weiter*, cannot be registered at all in the form of a curve. This progress has rather to be conceived in terms of control and organization, as a progressive and cumulative increase both in outward mastery over the environment and in inward self-determination or self-articulation on the part of the individual or the society that is in process of growth. A teleological formula may be adequate to express any single term in the progression; but it may become misleading when it is applied to the summation of the whole series; and in attempting to express this whole—in which the essence of growth consists—we shall find the concepts of mastery and articulation more illuminating than any others.

A teleological formulation of the transit from one integration to the next differentiation into which it overbalances is given in the following passages from a 'post-war' English *Anti-Utopia* from which several quotations have been made in this Study already.

"Don't you wish you were free, Lenina?"

"I don't know what you mean. I am free. Free to have the most wonderful time. Everybody's happy nowadays."

He laughed. "Yes, *Everybody's happy nowadays*. We begin giving the children that at five. But wouldn't you like to be free to be happy in some other way, Lenina? In your own way, for example; not in everybody else's way."

"I don't know what you mean", she repeated. . . .

"Once you began admitting explanations in terms of purpose—well, you didn't know what the result might be. It was the sort of idea that might easily de-condition the more unsettled minds among the higher castes—make them lose their faith in happiness as the Sovereign Good and take to believing, instead, that the goal was somewhere beyond, somewhere outside the present human sphere; that the purpose of life was not the maintenance of well-being, but some intensification and refining of consciousness, some enlargement of knowledge."¹

When 'purpose' is interpreted in this somewhat esoteric sense of an *élan* which transcends not only the individual situation and the individual act but also the individual personality or social group, then it becomes virtually identical in meaning with the concepts of progressive mastery of the environment and progressive self-determination; and this identification is explicitly made in the following

¹ Huxley, Aldous: *Brave New World* (London 1932, Chatto and Windus), pp. 106 and 209.

passage from the pen of the South African philosopher-statesman whom we have so often quoted.

'Evolution is a fact of observation and experience, and it shows a persistent trend: from Matter to Life; from Life to more Life and to higher Life; from higher Life to Mind; from Mind to more and higher Mind and to Spirit [*sic*] in its highest creative manifestations. . . . The trend of slight overbalance is towards . . . a structural character which will ever more approximate towards wholeness. . . . The nature of the Universe points to something deeper, to something beyond itself. The persistent direction on the whole shows that it is not self-sufficing. It has a trend; it has a list. It has an immanent Telos. It belongs to or is making for some greater whole. And the pull of this greater whole is enregistered in its inmost structures.'¹

Perhaps this is as far as we can penetrate into the nature of the growths of civilizations. The process by which they grow makes the next demand upon our attention.

¹ Smuts, J. C.: *Holism and Evolution*, 2nd ed. (London 1927, Macmillan), pp. 185-7.

C. THE PROCESS OF THE GROWTHS OF CIVILIZATIONS

I. THE CRITERION OF GROWTH

(a) INCREASING COMMAND OVER THE HUMAN ENVIRONMENT

WE have seen that the growths of civilizations are in their nature progressive movements. Civilizations grow through an *élan* that carries them from challenge through response to further challenge and from differentiation through integration to differentiation again. We have also seen that this kind of progress cannot properly be described in the spatial metaphor of 'direction'. For the progress which we call growth is a cumulative progress, and its cumulative character is apparent in both its outward and its inward aspect. In the Macrocosm, growth reveals itself as a progressive and cumulative mastery over an external environment; in the Microcosm, as a progressive and cumulative inward self-determination or self-articulation. In either of these two manifestations of growth—the external or the internal—we have a possible criterion of the progress of the *élan* itself. Let us examine each manifestation in turn from this standpoint. In considering, first, the progressive conquest of the external environment, we shall find it convenient to subdivide the external environment into the physical environment, constituted by non-human Nature, and the human environment—which, for any given human society at any given moment, consists of all the other human societies with which it finds itself in contact. Let us begin our examination with the human environment, interpreted in this sense.

The progress made by any growing civilization in the conquest of its human environment may be measured, for practical purposes, in terms of geographical expansion. For, seeing that the greater part of the habitable world may be presumed to have been occupied already, in some fashion and to some degree, by primitive human societies before ever any human society entered on the path of civilization, the geographical expansion of any society in process of civilization can seldom or never have taken place except at some other society's expense.¹ On this showing, the geographical expansion of a civilization can be taken as a fair index of its progress in conquering its human environment; and this index is not only fair

¹ The society that is the victim of an alien society's expansion in any given case may, of course, either be still on the primitive level or else have entered on the path of civilization on its own account. The respective effects of the impact of an expanding civilization in these two different cases are dealt with in Parts VIII and IX, below.

but convenient, since expansion is a process which is easy to observe and measure. We have now to ask ourselves whether expansion is an equally good criterion of a civilization's growth—in the comprehensive sense which includes growth in wisdom as well as in stature. If we are to answer our question in the affirmative, we cannot be content with merely showing that geographical expansion is a possible and occasional concomitant of growth in its wider and deeper sense. We must demonstrate that it invariably accompanies growth and that it also invariably comes to a standstill if a civilization suffers abortion or arrest or breakdown and disintegration. More than that, we must demonstrate that the correlation of geographical expansion with growth is as definite as its correlation with the conquest of the human environment: that such expansion keeps pace, in its rapidity and its extent, with the *élan* of the growth of which it is assumed to be the criterion; and that, conversely, it not only comes to a halt when growth is arrested, but gives place to contraction when a civilization disintegrates and is finally reduced to vanishing point when disintegration ends in extinction. If we amplify our original question in these terms and seek to answer it by applying our well-tried empirical method, we find that on every count the answer proves to be in the negative.

In the matter of sheer geographical range, an empirical survey reveals the widest diversity in the actual expansion of different civilizations whose respective achievements in this field are fairly comparable, without revealing any corresponding difference in the degrees of growth attained by the several civilizations which are in question in each instance.

For example, there was an age-long competition between the Egyptian, Sumeric, and Minoan civilizations for expansion into the no-man's-land of Syria which lay between them; and in this competition the Egyptian Civilization was decidedly less successful than either of its rivals. At an early date in the history of this generation of civilizations, the Egyptian culture pushed up the coast of Syria as far as Byblos at the northern end of the Lebanon. Yet although it was the first in the field, and notwithstanding its success in making its way along the forbidding Phoenician section of the coast (where the Lebanon range falls steeply into the sea, with no coastal plain between),¹ the Egyptian culture failed to penetrate into the interior of Syria before the far more distant Sumeric Society had succeeded in annexing this part of Syria to its own domain.² Finally, the original field of Egyptian expansion

¹ For the geographical character of Phoenicia, see II. D (ii), vol. ii, pp. 51-2, above.

² For the line of demarcation between the Sumeric and the Egyptian sphere in Syria in the pre-Hyksos age, see II. D (vii), vol. ii, pp. 388-9, above.

along the Syrian coast was captured from the Egyptian Society, after the Egyptian cultural ascendancy here had prevailed for some two thousand years, by the Minoan Society, which, in the *Völkerwanderungen* of the fourteenth to twelfth centuries B.C., succeeded in establishing itself not only in Cyprus (a natural field of expansion for a maritime power from the Aegean), but even on the Syrian mainland, and this on the southernmost section of the Syrian coast on the very threshold of Egypt itself.¹ In other directions, likewise, the Egyptian Society shows to equal disadvantage, in terms of geographical expansion, by comparison with its two neighbours. The percolation of the Egyptian Civilization up the Nile exhibits neither the range nor the drive of the maritime expansion of the Minoan Civilization into the Mediterranean or the overland expansion of the Sumeric Civilization over South-Western Asia and out beyond into Europe and into India. Yet manifestly this marked inferiority of the Egyptian Civilization in expansive power cannot be taken as a token of any corresponding deficiency in the *élan* of its growth; for an intuitive view of the histories of the three civilizations here in question gives the impression that the Egyptian Civilization grew at least as fast and as far as either of the two others.

Or let us compare the expansion of the Hellenic and Syriac civilizations with that of their seniors in their own generation—the Indic and the Sinic. The two Mediterranean civilizations display the same expansive power as the older Minoan Civilization, to which they are both related. They not only expand overseas, from the Levant and the Aegean down the whole length of the Mediterranean and out through the Straits of Gibraltar into the Atlantic. They show an equal capacity to expand thereafter overland, in the opposite direction, into the interior of Asia; and here they reach and impinge upon the Indic and the Sinic worlds before ever the Indic and the Sinic societies have crossed their own thresholds in order to go out to encounter them. Just as the Minoan Civilization had once deposited its Philistine pioneers—or refugees—on the threshold of Egypt, so the two Mediterranean civilizations deposit on the thresholds of India and China their exotic styles of art and their exotic scripts.

In India, the Kharoshti script is certainly derived from the Aramaic alphabet and the Brahmi script possibly derived from the Phoenician;² while in the Far East the scripts employed in modern times by the Manchus and the Mongols to convey their own

¹ For the establishment of the Philistines in the Shephelah, see I. C (i) (b), vol. i, pp. 100-2, above. For the affiliation of the subsequent Syriac Civilization to the Minoan Civilization, see I. C (i) (b), vol. i, pp. 102-3, and II. D (vii), vol. ii, pp. 386-7, above.

² See Jensen, H.: *Geschichte der Schrift* (Hanover 1925, Lefaire), especially pp. 116-17, 146-7, and 199-216.

languages are likewise derived from the Syriac Alphabet and not from the Sinic characters—an extraordinary testimony to the superiority of the Syriac over the Sinic Civilization in expansive power, considering that Manchuria and Mongolia lie close up against the Great Wall, in immediate proximity to the homeland of the Sinic culture, whereas both countries are separated by the whole breadth of Asia from the Syrian birthplace of the scripts which they have actually adopted.¹

As for styles of art, the modification of the Hellenic Style which was worked out in North-Western India, after the intrusion of Hellenism upon the Indic World, between the second century B.C. and the second century of the Christian Era, was afterwards carried, by Mahayanian Buddhist missionary enterprise, through the Oxus-Jaxartes Basin and the Tarim Basin into North-Western China, to become the germ of the Far Eastern art which has superseded the pre-Helleno-Buddhist style of the ancient Sinic Society.

Thus the expansive power of the Syriac and Hellenic civilizations has been vastly greater than that of the Indic or the Sinic. Yet, who will venture to affirm dogmatically that the Syriac and Hellenic civilizations have surpassed the other two in their general and genuine growth?

The inadequacy of the geographical criterion in the case in point is exposed by the fact that the Indic Civilization, which had waited on its own ground for Hellenism to bring a new style of art to its door, thereafter assumed the expansive role on its own account and became the carrier by which the Hellenic style was conveyed, over the last long stage of its immense journey, from the Indus to the Tarim and from the Tarim to the Yellow River. For (as has just been mentioned) Hellenic art reached the Far East as the instrument of Mahayanian Buddhist propaganda, and the Mahayana, of course, was a creation of Indic souls. This extraordinary difference in the degree of the expansive power which the Indic Civilization has put forth in this or that geographical direction has struck, and baffled, the mind of a great modern Western authority on Indic religion, who finds himself reduced to an arbitrary explanation which is really no explanation at all.

'Ideas, like empires and races, have their natural frontiers. Thus Europe may be said to be non-Muhammadan. . . . Similarly, in the

¹ The existence of the Mongol Alphabet may have inspired the invention of the Korean Alphabet; for the invention was made at a time (*regnante Hsien Wang, A.D. 1419-50*) when the Koreans had recently been in contact with the Mongols during the Mongol political domination which had extended over Korea and China alike. On the other hand, the forms of the new Korean alphabetic characters seem to have been borrowed from some Indic script in which the Koreans had received the original texts of the Buddhist Scriptures. (See Jensen, *op. cit.*, p. 152; Carter, T. F.: *The Invention of Printing in China and its Spread Westward*, revised ed. (New York 1931, Columbia University Press), pp. 174-5.)

132 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
regions west of India,¹ Indian religion is sporadic and exotic. . . . But in Eastern Asia the influence of India has been notable in extent, strength, and duration.²

If we glance next at the pair of civilizations 'affiliated' to the Syriac Civilization, we find no difficulty in deciding that the Iranic Civilization, which swallowed up the Arabic in the third century after the simultaneous birth of both,³ has grown further than the sister-civilization which has been its victim. Yet, if geographical expansion be the index of growth, it can only be said that, in this instance, the index is singularly uninformative; for, in terms of expansion, the discomfited Arabic Civilization makes just as good a showing as the triumphant Iranic. The expansion achieved by the Iranic Civilization in the fourteenth and fifteenth centuries of the Christian Era is impressive enough, whether we follow its course into South-Eastern Europe or into the Deccan or on to the Eurasian Steppe; but it is no more impressive than the contemporary and subsequent expansion of the Arabic Civilization up the Nile and across the Sahara into Tropical Africa and over the Indian Ocean into Indonesia. In this instance, at any rate, the attempt to use geographical expansion as a criterion of growth is a conspicuous failure.

Or let us compare the growths of the two sister-civilizations—the Babylonian and the Hittite—which are both related to the Sumeric. On an intuitive view, the Hittite Civilization, in the course of a shorter life, would appear to have gone farther in its growth than its Babylonian sister. Yet the geographical expansion which the Hittite Civilization achieved in the sixteenth to thirteenth centuries B.C. through the militarism of the Khatti Power was not so wide as the expansion of the Babylonian Civilization in the ninth to seventh centuries B.C. through the militarism of the Assyrians.

We find the same absence of correlation between geographical expansion and genuine growth if we extend our survey from the Old World to the New. In the first generation of indigenous American civilizations, the Mayan culture appears to have shown greater expansive power than the Andean. At any rate, at the dawn of Andean history there is some shadow of archaeological evidence for Mayan influence along the stretch of South-American coastline on which the Andean Civilization then emerged,⁴ while there appears to be no trace of any counterflow of Andean cultural influence from South America into Central America until the time

¹ 'The frontier seems to be about long. 65° E.'

² Eliot, Sir Charles: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. i, pp. xii-xiii.

³ See I. C (i) (b), vol. i, pp. 69-70, with Annex I.

⁴ See Means, P. A.: *Ancient Civilizations of the Andes* (New York 1931, Scribner), pp. 40-1 and 71-2.

of the interregnum between the disappearance of the Mayan Civilization and the emergence of the related Yucatec and Mexic civilizations¹—an epoch which, in Central America, marks the transition from the first generation of civilizations to the second. Yet it would be arbitrary to assert that the Mayan Civilization went farther than the Andean in its growth. And when we come to make a comparison between the two American civilizations of a younger generation—the Mexic and the Yucatec—which are both ‘affiliated’ to the Mayan Civilization, we find not merely an absence of correlation between expansion and growth, but an actual contrariety. While the Yucatec culture kept within the bounds of its own Central American peninsula, its Mexic neighbour not only occupied the Mexican Plateau but radiated northwards into North America as far as the Great Lakes.² Yet there can be little doubt that the Yucatec Civilization had achieved a greater measure of growth than the Mexic by the time when it suffered at Mexic hands the same fate that, in the Old World, was to be suffered by the Arabic Civilization at the hands of the Iranic.

In our own World in our own day we have the most imposing spectacle of expansion of any that are on record. For the first time in human history, so far as we know, one single human society has now succeeded in expanding until it has come to embrace within its system all the habitable lands and navigable seas on the face of the planet. There could hardly be a greater difference in degree of expansive power than the difference which has appeared in recent times between the world-wide expansion of our own Western Civilization and the relative immobility of the other surviving civilizations. Every one of these other civilizations has been content to remain within its own bounds while the ever expanding Civilization of the West has washed round its coasts, encircled its frontiers, knocked at its gates, broken through its defences, and forced an entrance into its inmost citadel. Yet at this very moment, when the ‘Westernization’ of the non-Western civilizations is making headway at an unprecedented rate and is being carried to unforeseen lengths, *Homo Occidentalis* has been overtaken by a mistrust of his own *élan* and an uncertainty about his own future which (to judge by the precedents) are ominous symptoms.³

These Western misgivings in the heyday of our Western ex-

¹ For the introduction of the technique of metallurgy into Central America during the post-Mayan interregnum—in all probability from the Andean World—see pp. 161–2, below. In other departments of material culture besides the metallurgical, Andean influence is discernible in the Zapotec province of the Mexic culture, in the district of Oaxaca (see Joyce, T. A.: *Mexican Archaeology* (London 1914, Lee Warner), pp. 192 and 369–70).

² See II. C (ii) (a) 2, vol. i, pp. 264–5, above.

³ For a survey and analysis of the psychological symptoms of social disintegration, see Part V, below. For a diagnosis, from this standpoint, of the Western *éthos* in our own day, see the present chapter, section (d), pp. 210–12, and Part XII, below.

pansion will not appear fantastic in the light that is thrown upon the present situation of our Western Society by the histories of the abortive and the arrested civilizations. For three out of the four abortive civilizations¹ and four out of the five arrested civilizations² went uncommonly far in their geographical expansion; yet in all these cases any correlation between expansion and growth is ruled out *a priori*, since the abortive civilizations ceased to grow before coming to birth and the arrested civilizations in their infancy.

Thus the empirical test plainly shows that, while the progressive and cumulative conquest of the human environment may perhaps be measured fairly in terms of geographical expansion, this geographical index is not a criterion of growth. And indeed the only social 'law', apropos of geographical expansion, which it is possible to discern appears to operate in a contrary sense; for the correlation which this law suggests is not between geographical expansion and social growth, but between geographical expansion and social retardation.

There seems to be some warrant for the formula that, as a rule, the social effect of geographical expansion in an outward direction from the geographical centre of a civilization towards the periphery is equivalent to a retardation of social progress in the Time-dimension: a retardation which, in acute cases, may pass over into an arrest and in extreme cases into an actual retrogression.

A good example of this phenomenon is the history of our modern Western 'Renaissance'.³ In Northern and Central Italy, where this intellectual movement originally came to birth, it emerged as early as the fourteenth century of the Christian Era and attained its highest point of intensity in the fifteenth. On the other hand, in England the equivalent centuries were the sixteenth and seventeenth, in France the seventeenth and eighteenth, in Germany the eighteenth and nineteenth; so that the German *Aufklärung* of the age of Goethe corresponded in character to the phase through which the Renaissance had been passing in Italy some four centuries earlier. In fact, this modern Western Renaissance was a kind of social wave, first generated in Italy, which took an appreciable time to travel outwards from its centre of dispersion to other parts of the original homeland of the Western Civilization in Western Europe.

The operation of our law becomes more strikingly apparent when

¹ The Far Eastern Christian, the Far Western Christian, and the Scandinavian, by contrast with the abortive Syriac. (For a comparison between the Scandinavian and the Ottoman expansion, see II. D (vii), Annex VII, vol. ii, above.)

² The Polynesian, the Eskimo, the Nomadic, and the Ottoman, by contrast with the Spartan. (For the failure of the 'Osmanlis, in their expansion, to occupy just those key points which it would have been really profitable for them to occupy, see II. D (vii), Annex VII, vol. ii, above.)

³ For renaissances in general as outcomes of the contacts between civilizations in the Time-dimension, see Part X, below.

we examine the social effects of the propagation of our Western Civilization from its homeland in Western Europe into the new domains which it has acquired by colonization overseas. For the popular notion that the overseas *êthos* is essentially radical, if not progressive, turns out to be illusory on a closer view. It is true that, in the technological field, the challenge of having to wrestle, short-handed, with an untamed Physical Nature has sometimes stimulated the Western overseas pioneers who have been exposed to this ordeal to make remarkable mechanical inventions; and it is also true, as we have seen in another connexion,¹ that the very process of transmarine migration has a disintegrating effect upon the migrants' social heritage which offers an opportunity for new social creation. This opportunity was taken, with brilliant results, by the Scandinavian settlers in Iceland and the Hellenic settlers in Ionia; but it is an opportunity and no more, which the overseas settler is at liberty to take or leave as he chooses. It is equally in his power to justify the proverb that *caelum, non animus, mutant qui trans mare currunt*.² Transmarine migration is merely a possible stimulus and not an automatic and infallible forcing-process of mental growth; and, if this stimulus evokes no response, there is little virtue in the stimulus to mechanical invention which overseas settlement in an undeveloped country likewise administers; for the field of mechanical invention—however great the pioneer's progress in this field may be—lies, after all, on an extremely superficial plane of social life. So that, in neglect of manifest opportunities and in spite of superficial appearances, the colonial *êthos* may prove, in any given historical instance, to be mentally old-fashioned. And such old-fashionedness is undoubtedly the hall-mark of our modern Western Overseas World.

At an earlier point in this Study,³ we had occasion to glance at the living museum of the Egyptiac Society in the predynastic age which is provided, down to this day, by the Dinka and the Shilluk barbarians on the upper reaches of the White Nile. Within the compass of a far shorter Time-span, we can observe, in modern America and Antipodea, a number of living exhibits of Western social conditions which are no longer extant in Europe. In our twentieth-century Quebec and Appalachia and Charleston and Transvaal and Peru and Macao, we have living museums of a seventeenth-century or sixteenth-century Normandy and Ulster and England and Holland and Castile and Portugal.⁴ And, even in the

³ In Part II. C (ii) (b) 2, vol. i, pp. 312-15.

⁴ Compare the living museum of a Hellenic city-state which survived down to the ninth century of the Christian Era at Cherson in the Crimea, at the uttermost extremity of the colonial domain of the defunct Hellenic Society. (See II. D (vi), Annex, vol. ii, p. 404, footnote 2, above.)

136 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS

technological field, the overseas settler is not invariably an innovator. As an offset to those 'Yankee Notions' which we are inclined to regard as characteristic of the modern Western Overseas World as a whole, we may remind ourselves that, down to the first half of the nineteenth century, the descendants of the Spanish settlers in New Mexico and Texas still rode forth to war equipped with lance and shield—an equipment which, in Spain itself, was already ludicrously obsolete by the time when Cervantes was writing *Don Quixote*! The quaintness of these latter-day Don Quixotes of the New World made a vivid impression upon the minds of the English-descended American pioneers who encountered and discomfited the Spanish-descended Texans and New Mexicans in the early decades of the nineteenth century. Yet our transmarine Don Quixote, if he had 'had his eyes skinned', might have turned the laugh against Uncle Sam; for while the Spaniard of New Spain had clung to the European military equipment of the early seventeenth century,¹ the New Englander, on his side, had preserved a vestige of the civilian costume of the same period in the shape of the steeple-crowned hat.² And Don Quixote might also have noted that the wave of the Italian Renaissance, which had swept over Spain in the

¹ For a description of the shields which were still part of the regular equipment of the Spanish cavalry in New Spain in the first decade of the nineteenth century, see Pike, Z. M.: 'Observations on New Spain', in *The Expeditions of Zebulon Montgomery Pike*, edited by Coues, E. (New York 1895, Harper, 3 vols.), vol. ii, p. 794. See further Gregg, J.: *Commerce of the Prairies, or The Journal of a Santa Fé Trader* (New York 1844, Langley, 2 vols.), vol. i, ch. xi, p. 221:

'A great portion of the military are obliged to use the clumsy old-fashioned *escopeta* or firelock of the sixteenth century; while others have nothing but the bow and arrow, and sometimes the lance, which is in fact a weapon very much in use throughout the country.'

Scopetus is actually the word used for 'firelock' in the sixteenth-century Latinity of Ogier Ghiselin de Busbecq.

For the old-fashioned life of New Spain in the early nineteenth century, see Pike and Gregg, *op. cit.*, *passim*: e.g. Gregg's description of the riding-dress of the contemporary New Mexican Caballero in *Commerce of the Prairies*, vol. i, pp. 211-14.

² This antique style of headgear re-emerged from its Transatlantic 'living museum' on the heads of the envoys from the ex-English colonies in North America who came to Paris during and after the American Revolutionary War. The unexpected resurrection of the *chapeau Henri Quatre* caught the French eye and tickled the French fancy and inspired French hands to fashion the embryo of the nineteenth-century top hat! 'The top hat (Zylinderhut) was . . . known already in the eighteenth century. It originated in England as the Puritan and Quaker hat and migrated to America in order to find its way back thence to Europe. It was the European enthusiasm for North America when she was in the throes of her war of liberation that brought this headgear into fashion on the Continent—where it had attracted no attention until then—in Liberal circles. The sympathies . . . which this struggle evoked in the steadily growing Liberal camp were extended to the American hat as well as to the American cause; and thus our top hat—which was the form into which the Quaker hat had blossomed out—came to Europe as a symbol of Liberal ideas.' (Timidiör, O.: *Der Hut und Seine Geschichte* (Vienna and Leipzig 1914, Hartleben), p. 58.) For the political significance of the top hat when it made its appearance—or rather its reappearance—in Europe, see further *op. cit.*, pp. 80-1, and Rosenberg, A.: *Geschichte des Kostums* (Berlin 1906, Wasmuth), vol. iii, p. 267). It is amusing that this revolutionary cachet should have been associated with a type of hat which was actually more antique than the discomfited *tricorne* of the *Ancien Régime*. It is also amusing to find that, between 1797 and 1848, the new bourgeois headgear ran through the whole gamut of symbolism from ultra-revolutionariness to ultra-respectability. (See Timidiör, *op. cit.*, pp. 80-1.)

generation of Cervantes and over Germany in the generation of Goethe, only irrigated New England in the generation in which Texas was conquered from its Spanish-descended occupants by Sam Houston and his fellow-filibusters. Moreover, the intellectual renaissance of Houston's respectable fellow-citizens and contemporaries in New England—an Emerson and a Longfellow and a Thoreau and a Hawthorne—passed over as swiftly and as abruptly as an Indian Summer.¹

When the landscape of the Catskill Mountains inspired Washington Irving to conceive the myth of Rip van Winkle, an overseas genius was really expressing in mythological imagery the essence of the overseas experience; and, at bottom, this experience is common to the whole Overseas World. It has overtaken the hustling New Yorker and the sharp-witted New Englander, as well as the citizen of Charleston or Cuzco, or the Appalachian mountaineer, or the Afrikaner farmer, in whose outward bearing its effects are more manifestly apparent.

The phenomenon is conspicuously manifest in the field of religion. The most old-fashioned form of Protestantism that is a living faith to-day is the 'Fundamentalism' of the Mississippi Basin; the most old-fashioned living Catholicism is the Catholicism of Quebec, or the faith of Mexican Guadalajara with its militant 'Cristeros', who wage a chronic guerrilla war against the modernism of the Mexican Revolution with all the zeal that used to animate their Crusading forefathers when they fought against Islam in medieval Spain. In Russian Orthodox Christendom, again, we find 'the Old Believers' surviving on the periphery of the Russian Empire, in Siberia and the Caucasus and on the Eurasian Steppe.² And on the peripheries of the *ci-devant* Syriac and Indic worlds we find the most primitive extant survivals of Syriac and Indic religion. The most primitive forms of Judaism survive, as we have seen, in the peripheral fastnesses of the Caucasus and the Crimea and Abyssinia and the Yaman; and Abyssinia is also the home of a Monophysitism which is the most primitive living specimen of any form of Christianity.³ In a similar pattern, we find the Hinayana surviving on the southern periphery of the ancient Indic World in Ceylon and Burma and Siam, and the Tantric form of the Mahayana on the northern periphery in the fastness of Tibet.⁴

Our law that geographical expansion produces social retardation may also be illustrated from the philological field. In Appalachia, forms of English speech are still alive that have become extinct in

¹ See Mumford, L.: *The Golden Day* (Oxford 1927, University Press).

² See II. D (vi), vol. ii, p. 222, above.

³ See II. D (vi), Annex: 'Jews in Fastnesses', in vol. ii.

⁴ See II. D (vi), Annex, vol. ii, p. 405, footnote 1.

the British Isles, and folk-songs are still sung that have been forgotten in their European homeland. Again, the most old-fashioned living dialect of the Castilian language is to be found to-day, not in the Peninsula, but among the Castilian-speaking Jews in the Near East who are descended from Jews expelled from the Peninsula in the fifteenth century.¹ We find the same phenomena in the Far East. The most old-fashioned living dialects of Chinese are those which are spoken in the provinces of the Southern Seaboard from Kiangsu to Kwangsi inclusive; and these provinces were colonized by Chinese settlers from the North as lately as the time of the T'ang Dynasty.² Similarly, in the ancient Syriac World, we find the Canaanite language surviving as a living language in the colonial domain of the Syriac Society in North-West Africa at least six centuries after it had been superseded in its Phoenician and Palestinian homelands by the intrusive Aramaic.³

The evidence of Archaeology accords with that of Philology. We have noticed already⁴ how in 'pre-historic' Scandinavia, on the periphery of the Old World, the successive techniques that had arisen in the central regions and had gradually radiated outwards each continued to be practised by Scandinavian craftsmen for many centuries after they had been superseded by technical innovations in Sumer and Egypt and Crete.⁵ Similarly, we find that the Minoan style of technique and art survived in Sicily⁶ and Cyprus, at the western and eastern extremities of the Minoan World, after it had become extinct in the Cretan homeland of the Minoan culture;⁷

¹ For this expulsion, see II. D (vi), vol. ii, pp. 243-4, above.

² See I. C (i) (b), vol. i, p. 90, and II. D (iii), vol. ii, pp. 83-4, above.

³ Aramaic began to become the lingua franca of all the Semitic-speaking peoples in the Babylonian and Syriac worlds during the eighth and seventh centuries B.C. The process was assisted by the violent redistribution of populations under the impact of Assyrian militarism, and it was completed by 'peaceful penetration' under the Achaemenian and Seleucid Empires (see I. C (i) (b), vol. i, pp. 80-1, above). By the second century B.C., the Canaanite language had probably been replaced almost completely as a spoken language in Phoenicia and Palestine by either Aramaic or Greek. On the other hand, in North-West Africa, the old Canaanite speech of the original Phoenician colonists continued to be spoken right down to the time of St. Augustine (*decessit* A.D. 430) as the vernacular of the peasantry, who then still talked of themselves as 'Canaanites'; and there are even indications that the language lingered on in this region, here and there, until after the Arab conquest in the seventh century of the Christian Era. (See Mommsen, Th.: *The History of Rome: The Provinces from Caesar to Diocletian*, Part II, English translation (London 1886, Bentley), pp. 326-9; see further Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot), Part II, ch. i: 'La Survivance de Carthage.') As a dead language, Canaanite has, of course, survived down to this day in the Hebrew scriptures and liturgy of the Jews; and, by an unprecedented *tour de force*, this dead Hebrew has been brought to life again during the nineteenth century, in 'the Pale', as a literary vehicle for the conveyance of modern Western ideas, and in the twentieth century, in Palestine itself, as the mother-tongue of the Palestinian-born children in the Zionist colonies.

⁴ In II. D (vii), vol. ii, on p. 342, footnote 3, above.

⁵ In this connexion, we may also notice that in modern times the conceit of writing Latin verses, which had been initiated by the Italian Renaissance, continued to be practised in Sweden, as in England, after it had fallen out of fashion in Italy.

⁶ See Glotz, G.: *La Civilisation Egéenne* (Paris 1923, Renaissance du Livre), p. 258.

⁷ In Cyprus, a version of the Minoan script also survived down to the fifth century B.C., in the form of a syllabary which was used for conveying the Cypriot dialect of Greek.

while the Hittite style and technique and pictographic script likewise survived in Northern Syria, at the south-eastern extremity of the Hittite World, after their extinction in the homeland of the Hittite culture on the Anatolian Plateau.

So much for the direct effects of geographical expansion upon social growth. Returning now to our inquest, we may next observe that, on an empirical test, a good case can be made out for a correlation of geographical expansion, not with social growth, but, on the contrary, with social disintegration.

Let us take, for example, the history of the Hellenic Civilization. We have noticed, above,¹ that, at one stage of its history, the Hellenic Society met the challenge of over-population by geographical expansion on the grand scale; that, after some two centuries, this expansion was brought to a halt by the successful resistance of certain non-Hellenic forces; and that Hellenism responded to this new challenge by changing over from the extensive to the intensive method of economic development as a new way of dealing with the persistent problem of over-population under the new conditions which the stoppage of expansion had imposed. To Hellenic observers, looking back at short range upon this particular crisis of Hellenic history, the period of readaptation, when the Hellenic Society was transforming the *élan* of its growth from an extensive to an intensive rhythm, had all the appearance of a time of tribulation. As Thucydides saw it, from the age of Cyrus and Darius 'Hellas was repressed from all sides over a long period of time, with the consequence that, in this period, she neither performed any great co-operative achievement nor showed any enterprise in the parochial life of the individual city-state communities'.² As Herodotus saw it, 'the three successive generations covered by the reigns of Darius Hystaspes-son and Xerxes Darius-son and Artaxerxes Xerxes-son saw Hellas overwhelmed by more troubles than she had had to suffer from first to last during the twenty generations preceding Darius's accession'.³ The modern reader finds it difficult to realize that, in these melancholy sentences, the two greatest of all Greek historians are describing the age which, in the sight of posterity, stands out in retrospect as the acme of the Hellenic Civilization: the age in which the Hellenic genius performed those great acts of creation, in every field of social life, which have made Hellenism immortal. Herodotus and Thucydides felt as they did about this creative age because it was an age in which, in contrast to the age before it, the geographical expansion of the Hellenic World was being held in check by the pressure of more potent external forces.

¹ See I. B (i), vol. i, pp. 24-5; II. D (ii), vol. ii, pp. 39-49; and Part III. B, pp. 120-2, above.

² Thucydides, Bk. I, ch. 17.

³ Herodotus, Bk. VI, ch. 98.

Yet there can be no question but that, during this century between the accession of Darius and the outbreak of the Peloponnesian War, the *élan* of the growth of the Hellenic Civilization was greater than it had been during the two immediately preceding centuries, when the maritime expansion of Hellenism over the Mediterranean was in flood-tide. And if a Herodotus or a Thucydides could have been endowed with superhuman longevity to enable him to observe the sequel, he would have marvelled to find that the breakdown of the Hellenic Civilization in the Peloponnesian War (a catastrophe which Thucydides lived to record) was followed by a fresh outburst of geographical expansion—the expansion of Hellenism overland, inaugurated by Alexander—which not only equalled but far surpassed the earlier maritime expansion of Hellas in material scale. During the two centuries that followed Alexander's passage of the Hellespont, Hellenism expanded in Asia at the expense of all the other civilizations—the Syriac and the Egyptian and the Babylonian and the Indic—which it encountered on its path. And, for some two centuries after that, it continued to expand, under the Roman aegis, in the barbarian hinterlands of the Hellenic World in Europe. Yet these were centuries during which the Hellenic Civilization was palpably in process of disintegration!

Thus, in Hellenic history, we observe that the *élan* of growth was at its maximum in an age when geographical expansion was at a standstill; that this age of geographical stagnation, which was the great age of spiritual activity, was a relatively short interval which was followed, as well as preceded, by a considerably longer period in which geographical expansion was going forward vigorously; and that in the second of these two periods, when the Hellenic Civilization was already in process of disintegration, the drive of the geographical expansion was even more vigorous than it had been in the earlier period when the Hellenic Civilization had been still in process of growth. This Hellenic illustration suggests that, if expansion has any correlation with growth at all, the ratio is inverse; or, in other words, that geographical expansion is a symptom not of social growth but of social disintegration.

This inference from the Hellenic case is fortified by a similar survey of the histories of other civilizations.

An inspection of Syriac history, for example, reveals a pattern comparable to that which we have just detected in Hellenic history. The great creative period of Syriac history—the age of the Prophets of Israel—was a period in which a previous Syriac expansion from the Levant into the Western Mediterranean had been brought to a standstill and even driven into retreat by the competitive maritime expansion of the rival Hellenic Civilization in the eighth to sixth

centuries B.C. Simultaneously, the Syriac Society was being harried from the opposite quarter by a violently aggressive movement on the part of the Babylonian Society in the guise of Assyrian militarism. In the latter part of the sixth century B.C., the Syriac World secured relief from these external pressures. In the maritime zone of conflict, the transmarine Syriac communities of Phoenician origin succeeded in checking the Hellenic advance by allowing one of their own number, the city-state of Carthage, to unite and organize their forces under her hegemony. In the continental zone, the Aramaeans and Israelites who had been transplanted, by the ruthless policy of Assyrian militarism, from their homes in the interior of Syria to the western rim of the Iranian Plateau, succeeded in turning the tables against their Babylonian oppressors by imparting their own Syriac culture to their Median and Persian fellow-victims,¹ with the eventual result that the Empire of the Medes and Persians, which entered into the Assyrians' heritage, came to perform the functions of a Syriac universal state. Thus, from the latter part of the sixth century B.C. onwards, the Syriac Civilization was holding its own again in the Western Mediterranean and was entering upon a new career of expansion on the Asiatic mainland. Yet this time of regained mastery over the human environment and of renewed material prosperity, as measured by geographical expansion, was not a period of spiritual growth. In the spiritual history of the Syriac Society, the interval between the sixth century B.C. and the second presents itself as a time of relative stagnation. After the turn of the political tide in the generation of Cyrus, Syriac souls were not again stimulated to fresh spiritual endeavours until the time when Hellenism renewed its attack on the Syriac World by attempting, under the leadership of Alexander and his successors, to capture its entire continental Asiatic domain and by succeeding, under the leadership of the Romans, in overthrowing the Carthaginian Power in the Western Mediterranean. These latter days, in which the Syriac World was no longer expanding territorially but was standing once again on the defensive, were the days in which the Syriac genius created the Psalms and the New Testament and the Confessions of Saint Augustine. It will be seen that, in Syriac as in Hellenic history, geographical expansion and spiritual growth appear to vary inversely to one another.

As for the Babylonian Society, it displayed singularly little expansive power at any stage of its history. After its emergence from the post-Sumerian interregnum (*circa* 1875-1575 B.C.), it never expanded at all until the rise of Assyrian militarism, which was itself a symptom of Babylonian disintegration; and this militant Assyrian

¹ See I. C (i) (b), vol. i, pp. 79-82, and II. D (v), vol. ii, pp. 137-8, above.

form of Babylonian expansion was more apt to evoke cultural antipathy than to prepare the way for cultural conquests. The exception which proves the rule is the case of Urartu (Ararat): a barbarian principality in the highlands of Armenia which bore the full brunt of Assyrian aggression, and at the same time adopted the Babylonian culture, in the course of the ninth and eighth centuries B.C.¹—apparently on the principle of keeping an enemy at bay by fighting him with his own weapons.

In Egyptian history it is much the same story. The incorporation of the Upper Nile Valley into the domain of the Egyptian culture—the only substantial and permanent enlargement of this domain that was ever achieved after the close of the pre-dynastic age—was not accomplished until after the Egyptian Civilization had broken down and had passed through its 'Time of Troubles' and had entered into its universal state. Nubia was annexed to Egypt politically under 'the Middle Empire'; but it was not until after this original Egyptian universal state had broken down and had then been restored in the shape of 'the New Empire' that Nubia was assimilated culturally to the homeland of Egyptian culture down-stream from the First Cataract.² In Syria, again, it was not until the time of 'the New Empire' that the ancient Egyptian sphere of influence in this quarter was extended from the coast to the interior: from Byblos to Naharayn.

In Sumerian history, similarly, the first known intrusion of the Sumerian culture into Syria from its homeland in Shinar was the raid of the Sumerian militarist Lugalzaggizi, who carried his arms from the basin of the Tigris and Euphrates to the shores of the Mediterranean; and Lugalzaggizi's career of military conquest was one of the outward symptoms of the breakdown of the Sumerian Civilization.³ The ensuing Sumerian 'Time of Troubles' saw the expansion of the Sumerian Civilization in another direction: across Anti-Taurus and Taurus on to the Anatolian Plateau.⁴ And the radius of Sumerian influence had never before been so wide as it finally came to be in the time of the Sumerian universal state: the Empire of Sumer and Akkad and its continuation in the Amorite Empire of Hammurabi.

Again, the Minoan culture attained its widest range of radiation in the phase which our modern Western archaeologists have labelled 'Late Minoan III'; and this phase did not begin until after the sack of Cnossos *circa* 1425 B.C.: that is to say, not until after the

¹ See II. D (v), vol. ii, p. 135, above.

² For the connexion between these relations of Nubia with Egypt and the role played in Egyptian history by the Thebaid, see II. D (v), vol. ii, pp. 114-15.

³ For the place of Lugalzaggizi in Sumerian history, see I. C (i) (b), vol. i, p. 109, above.

⁴ See I. C (i) (b), vol. i, pp. 110-11, above.

catastrophe in which the Minoan universal state—'the Thalassocracy of Minos'—had broken up and given place to the interregnum in which the Minoan Society went into liquidation. The hall-mark of decadence is stamped upon all the material products of Minoan culture dating from this third phase of the 'Late Minoan' period which our archaeological discoveries have brought to light. The handiwork of 'Late Minoan III' falls below that of the preceding phases of Minoan culture in standard of workmanship and in artistic power as conspicuously as it outranges all previous Minoan handiwork in its geographical distribution. In this Minoan instance, it looks almost as if a deterioration in the quality of craftsmanship was the price which had to be paid for an expansion of 'output'; and the moment at which this apparent sacrifice of quality to quantity was made seems to be coincident with the beginning of the end of the Minoan Civilization.

In Sinic history it is much the same again. During the age of growth, the domain of the Sinic Civilization does not extend beyond the Basin of the Yellow River. It is during the Sinic 'Time of Troubles'—'the Period of Contending States'—that the Sinic World incorporates into itself the Yangtse Basin on the south and the plains beyond the Pei-ho, in what is now the province of Chihli, on the opposite quarter. Ts'in She Hwangti, the founder of the Sinic universal state, carries the political frontiers of the Sinic World up to a line which is still delimited by the Great Wall; the Han Dynasty, which enters into the Ts'in Emperor's labours, pushes forward the Sinic frontiers still farther until they come to embrace the whole of the southern seaboard of China and the whole of the Tarim Basin. Thus, in Sinic history, the periods of geographical expansion and of social disintegration are contemporaneous.

So they are, likewise, in the history of the younger Far Eastern Society to which the Sinic Society is 'apparented'. In the main body of the Far Eastern World, on the Asiatic mainland, it is again the 'Time of Troubles' that is the period of expansion. The intrusion of the Eurasian Nomad barbarians, Khitan and Kin, on to the Far Eastern Society's domain in the role of conquerors—a trespass which convicted the invaded society of decadence on the political plane—provided a social channel along which the Far Eastern culture radiated out into the homelands of the barbarian invaders. The Mongol invaders, who brought the Far Eastern 'Time of Troubles' to a close by establishing a Far Eastern universal state, served the Far Eastern culture as carriers through whom it propagated itself round the western as well as the eastern coasts of the Eurasian Steppe and out beyond into the domains of remote and alien civilizations. Through the instrumentality of the Mongol empire-builders

—short-lived though the Mongol Empire was—the art of the disintegrating civilization of the Far East gave an inspiration to the art of the infant civilization of Iran; and it is possible and even probable, though still non-proven, that the Far Eastern invention of printing was introduced through the same agency into Western Europe.¹ This role of the Mongols was afterwards taken over by the last of the barbarian invaders, the Manchus, who reconstituted the Far Eastern universal state which the Mongols had founded, but which the Mongol Power had been unable to maintain against the indigenous reaction led by the Ming.² The Manchu Empire has been the vehicle through which the Far Eastern Society—‘taking its savage conquerors captive’ once again—has expanded in these latter days by incorporating Manchuria: a territory approximately equal in area to the combined areas of France and Germany as delimited in the peace-settlement of 1919-20.

This correlation between expansion and disintegration is characteristic of Far Eastern history not only in the main body of the Far Eastern World on the Continent, but also in the offshoot of the Far Eastern Society in the Japanese Archipelago. In the Japanese variant of Far Eastern history, as we have already had occasion to notice at an earlier point in this Study,³ geographical expansion and social disintegration stand to one another in a manifest relation of cause and effect. In Japan, the Far Eastern Civilization broke down and entered on its ‘Time of Troubles’ in the last quarter of the twelfth century of the Christian Era, when the barbarized—or re-barbarized—Japanese feudal nobility in the Kwanto asserted themselves at the expense of the unmilitary Imperial Court in Yamato: the Japanese province in which the exotic Far Eastern culture had found a second home after its first introduction into the Japanese Archipelago from Korea. This transfer of power from the cultivated men of peace to the uncouth and unruly men of war dealt the Far Eastern Civilization in Japan a blow from which it never recovered. And when we inquire who these usurping Japanese war-lords were and what was the basis of their ascendancy, we find that they were the backwoodsmen who, for several centuries past, had been extending the bounds of the Far Eastern Civilization on the Main Island of Japan at the expense of the barbarian Ainu. Through this long-continuing and ever-victorious border warfare, the backwoodsmen had developed the prowess in arms and acquired the

¹ On the question whether the art of printing in the Western World is a derivative from the more anciently established and certainly indigenous practice of the same art in the Far East, or whether our Western printing has been a separate and independent invention, see Carter, T. F.: *The Invention of Printing in China and its Spread Westward*, revised ed. (New York 1931, Columbia University Press).

² See II. D (v), vol. ii, pp. 121-5, above.

³ See II. D (v), vol. ii, pp. 158-9, above.

wealth in land which eventually gave them their ascendancy over the Imperial Court; but, in the self-same process, the backwoodsmen had been losing their own grip over the culture which it was their mission to propagate; and accordingly, when these Japanese backwoodsmen supplanted the Japanese courtiers, who had performed the *tour de force* of conserving the exotic Far Eastern culture in an alien social climate, the political revolution brought with it a cultural set-back, since the re-barbarization of the backwoodsmen now began to react upon the entire Japanese body social. In this instance, again, quality was sacrificed to quantity. A geographical expansion was purchased at the price of a social relapse.

The offshoot of the Orthodox Christian Society in Russia had much the same history, in this respect, as the offshoot of the Far Eastern Society in Japan. In this case—as we have also noticed already in another connexion¹—there was a transfer of power from the second home which the exotic Orthodox Christian culture had made for itself in the Upper Dniepr Basin at Kiev to the new domain which was conquered by the Russian backwoodsmen from the barbarian Finns in the Upper Volga Basin; and this shift of the social centre of gravity of Orthodox Christian Russia from the Dniepr to the Volga—from Kiev to Vladímir—was duly followed by a social breakdown for the same reasons that account for the parallel course of events in the history of Japan. Social relapse was the price of geographical expansion here again; and this expansion did not cease during the ensuing 'Time of Troubles' (*circa* A.D. 1075–1475), when the Russian city-state of Novgorod succeeded in spreading the Russian version of the Orthodox Christian culture from the Baltic to the White Sea and the Arctic Ocean. Thereafter, when the Muscovite Power brought this 'Time of Troubles' to a close by uniting all the Russian principalities under its own dominion in a Russian universal state,² the expansion of the Russian Orthodox Christendom proceeded at an unprecedented rate and on an unprecedented scale. It took the Muscovites less than a century to spread their dominion and their culture across the whole breadth of Northern Asia. In A.D. 1552, the eastern frontier of the Russian World still stood at a point on the River Volga west of Qāzān. By A.D. 1638, the frontier had been carried forward to the shores of the Sea of Okhotsk. In this case, again, geographical expansion was a concomitant, not of social growth, but of social decadence.

This correlation still holds good when we extend our survey from the Old World to the New. In Andean history, for example, Chile was brought within the ambit of the Andean culture for the

¹ See II. D (v), vol. ii, p. 154, above.

² A convenient conventional date for the establishment of this Russian Universal State is A.D. 1478: the year in which Muscovy absorbed Novgorod.

first time by the military conquests of the later Incas; and the Inca Power was the Andean universal state: the penultimate stage in the decline and fall of the Andean Civilization. In Mayan history, the expansion of the Mayan culture on to the Mexican Plateau and into the peninsula of Yucatan seems to have occurred at a time when the Mayan Civilization was approaching its mysterious end.¹ In Mexic history, the radiation of the Mexic culture over North America as far as the Great Lakes was contemporary with the Mexic 'Time of Troubles', when the Aztecs were warring down the other states-members of the Mexic World and were thrusting their way forward towards the establishment of a Mexic universal state.²

There remains a certain residue of doubtful or exceptional cases. The Yucatec Civilization, for example, appears—in sharp contrast to its sister-civilization, the Mexic—to have never expanded at all beyond its original homeland in the Yucatan Peninsula down to the time when its absorption into the Mexic body social cut its history short. The Hittite Civilization, which likewise came to a sudden violent end through the impact of an alien body, did previously expand in one direction—from the Anatolian Plateau into Northern Syria—and it may be questioned whether this expansion occurred in a time of growth or in a time of decadence. The question cannot be answered with any assurance, since the premature ending of Hittite history makes its life-line difficult to read. Yet we may reasonably conjecture that the collapse of the Hittite Society under the impact of the post-Minoan Völkerwanderung, in the early years of the twelfth century B.C., was the nemesis of the militarism in which the Khatti Power had been indulging for some two centuries past. In other words, we may interpret Khatti militarism as a symptom of Hittite social disintegration; and since the propagation of the Hittite culture in Northern Syria was a direct result of the conquest of that region by Khatti arms, it seems to follow, on this line of reasoning, that the correlation of geographical expansion with social disintegration is borne out by the course of Hittite history as far as we can make it out.

We have also to consider certain cases in which a civilization appears to have had an outburst of geographical expansion in its infancy without suffering any immediate arrest in its growth. Cases in point are the maritime expansion of the Hindu Civilization into Indonesia and Indo-China in the latter part of the first millennium of the Christian Era; the expansion of the Arabic Civilization from the Lower into the Upper Nile Basin in the fourteenth century of the Christian Era; and the contemporaneous expansion of the

¹ Spinden, H. J.: *The Ancient Civilizations of Mexico and Central America* (New York 1922, American Museum of Natural History), p. 137.

² See I. C (i) (b), vol. i, p. 124, and II. D (v), vol. ii, pp. 206–8.

Iranic Civilization in three different directions: into South-Eastern Europe and on to the Eurasian Steppe and into the Deccan. On closer inspection, however, we observe that all these three civilizations belong to the 'related' class; and that their infantile expansions are explicable as a 'carry-over' from previous movements of expansion, in the same directions, in which the antecedent civilizations had been engaged in the last days of their senile decay. Thus the expansion of the Iranic Civilization into South-Eastern Europe through the agency of the 'Osmanlis continues the previous expansion of the antecedent Syriac Civilization into Anatolia which had taken place through the agency of the Saljūqs during the post-Syriac and pre-Iranic interregnum. The expansion of Islam into the Deccan similarly follows on from its previous expansion into Hindustan. And on the Eurasian Steppe Timur Lenk treads in the footprints that had been left on the sand by the Ilék Khans and the Khwārizm Shāhs.¹ In the same way, the early Arabic expansion into Tropical Africa and the early Hindu expansion into Indonesia are simply the continuations of movements which had already been under way during the interregna in which the senile Syriac and Indic civilizations had disappeared and from which their infant successors had emerged. In all the cases here in question, the movement of expansion is traceable, not to some new impulse, but merely to the vestige of an old momentum.

So far, then, our survey appears to have revealed to us only two clear cases—namely, the maritime expansions of the Syriac and the Hellenic Civilization into the Western Mediterranean in the earlier half of the last millennium B.C.—in which a geographical expansion has been the concomitant, not of social disintegration, but of social growth. We may add to these examples the overland expansion of the main body of Orthodox Christendom into the Caucasus on the one hand and into South-Eastern Europe on the other;² for this expansion took place before the outbreak of the great Romano-Bulgarian War of A.D. 977–1019, in which the Orthodox Christian Civilization suffered its breakdown. Finally, we may enlarge this list of clear exceptions to our apparent law of the correlation between expansion and disintegration by citing certain obvious cases from our own Western history: for example, the expansion which the Western World achieved in its infancy when it absorbed into its own body social the abortive Far Western Christian and the abortive Scandinavian Civilization on its Atlantic fringes;³ its contemporary expansion on the European Continent from the Rhine to the Vistula at the expense of the North European barbarism, and from the Alps

¹ See II. D (v), vol. ii, pp. 142 and 144–8, above.

² See I. C (i) (b), vol. i, pp. 64–5, above.

³ See II. D (vii), vol. ii, pp. 322–60, above.

to the Carpathians at the expense of the Hungarian advance-guard of Eurasian Nomadism;¹ and its subsequent maritime expansion into every corner of the Mediterranean Basin, from the Straits of Gibraltar to the mouths of the Nile and the Don, in the widespread though ephemeral movement of conquest and commerce for which the most convenient short title is 'the Crusades'.²

In these three instances in our Western history, we have clear cases of geographical expansion being neither accompanied nor followed by any arrest in the expanding civilization's growth. But we cannot cite these incidents from our own past experience without evoking in our minds a question concerning our present situation and our future prospects—a question which is of the deepest interest to us in our generation, though, just because we stand *in mediis rebus*, we are reduced to mere guesswork in seeking for the answer. The question arises out of the fact that the whole geographical expansion of our Western Society in all the earlier chapters of its history has been utterly dwarfed in scale by the modern Western tide of world-wide 'Westernization' which set in towards the close of the fifteenth century of the Christian Era and is flowing in full flood in our day. As we contemplate this titanic movement—a movement which is sweeping over all the habitable lands and navigable seas on the face of the planet and which is undoubtedly the most important social phenomenon of recent times—we find ourselves speculating whether this is a concomitant of growth, like the three earlier bouts of Western expansion which we have already cited, or a symptom of disintegration, like the majority of the examples from the histories of other civilizations which we have encountered in the course of the foregoing survey.

Our only clue to the solution of this riddle of the future, in which our own destinies are involved, is the dim and perhaps deceptive light which may be obtained by analogy from the history of some other civilization which has already run its course from start to finish, so that the whole story is known.

If we seek such light from the history of the Hellenic Civilization which is 'apparented' to ours, we perceive first that the earlier instances of expansion in our own history—those Western expansions which unquestionably occurred in an age when our civilization was still in process of growth—are the analogues of the early expansion of Hellas over the Mediterranean. Indeed, this early maritime expansion of the Hellenic Society, which was in progress from about 725 to 525 B.C. and which thus occupied approximately the fifth and sixth centuries of Hellenic history (dating from the

¹ See II. D (v), vol. ii, pp. 166–71, above.

² See I. B (iv), vol. i, p. 38, above.

emergence of the Hellenic Civilization out of the post-Minoan interregnum), corresponds chronologically as well as morphologically with the early maritime expansion of our own civilization in the same quarter which is covered by the name of the Crusades; for the 200 years between A.D. 1095 and A.D. 1291, which are the two conventional termini of the Crusading period, are approximately equivalent, in our Western horoscope, to the fifth and sixth centuries of Western history (dating from the emergence of our Western Civilization out of the interregnum which followed the dissolution of the 'apparented' Hellenic Society). Pursuing our analogy, we perceive in the next place that, between the end of the Crusades and the beginning of our modern Western expansion, there is an interval during which the tendency of our Western Society to expand is held in check by the pressure of external forces. This period of geographical constriction, which runs from about A.D. 1275 to A.D. 1475, may be taken as the analogue of the period of similar geographical constriction which runs in Hellenic history from the rise of the Carthaginian and Achaemenian Empires to the generation of Alexander the Great. We have observed already that these two centuries of Hellenic history saw the Hellenic genius come to its finest flower. We may now observe that the two analogous centuries of our Western history witnessed the Italian Renaissance.

Up to this point, then, the analogy works out effectively; and we have now to consider whether we are to carry it through to its bitter end. Are we to find a Hellenic analogy to our modern Western expansion in the latter-day dissemination of Hellenism, along furrows ploughed by Macedonian and Roman arms, as far as India in one direction and Britain in the other? This analogy, likewise, works out, if we choose to apply it, both in the matter of date and in the matter of scale; and if we do apply it, we shall be giving an answer—and a melancholy answer—to the question of the significance of our modern Western expansion in the horoscope of our Western Civilization. In Hellenic history, the denouement of the plot makes it clear that this latter-day expansion, which began with Alexander's passage of the Hellespont and closed with Agricola's conclusion of the Roman conquest of Britain, was not merely a concomitant of social disintegration but was actually a symptom of the malady. Shall we follow the argument whither it is leading us, and nerve ourselves to pass the same judgement upon the modern expansion of our Western Society which began with the triumphant voyages of da Gama and Columbus and which now seems to be carrying us, their successors, into seas that run so high that Leviathan himself can scarcely breast the waves? Or shall we refuse to believe, on the strength of mere analogy, in a prospect

150 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
which cannot be confirmed by observation, and insist, since this prospect happens to be unpleasant, upon giving ourselves the benefit of the doubt?

In whichever of these alternative mental directions our personal temperaments may incline us to turn, our mental reaction to this Western case in point is likely to be highly subjective; but, for our present purpose in this Study, we can afford to leave the interpretation of our modern Western expansion in suspense; for our survey has really demonstrated already that the correlation between geographical expansion and social disintegration holds good at any rate on the whole.

How are we to account for this apparent social law? One obvious explanation is offered by the phenomenon of Militarism; for Militarism—as we shall see at a later point in this Study¹—has been by far the commonest cause of the breakdowns of civilizations during the four or five millennia which have witnessed the score or so of breakdowns that are on record up to the present date. Militarism breaks a civilization down by causing the local states into which the society is articulated to collide with one another in destructive internecine conflicts. In this suicidal process, the entire social fabric becomes fuel to feed the devouring flame in the brazen bosom of Molech.² The single art of war makes progress at the expense of all the arts of peace;³ and, before this deadly ritual has completed the destruction of its votaries, they may have become so expert in the use of their implements of slaughter that, if they happen for a moment to pause in their orgy of mutual destruction and to turn their weapons for a season against the breasts of strangers, they are apt to carry all before them.

A case in point is the latter-day expansion of Hellenism to India and to Britain between the fourth century B.C. and the first century of the Christian Era; for the roads which this expansion followed had been opened by Macedonian and by Roman arms, and those arms had been wrought up to an irresistible efficiency in the long-drawn-out internecine warfare between the Great Powers of the Hellenic World in which Athens failed to establish her hegemony and Rome succeeded in delivering 'the knock-out blow'.

Thus, in Hellenic history, Militarism was at least partly responsible for the latter-day expansion of the Hellenic World as well as for the disintegration of the Hellenic Society with which this expansion was contemporaneous. Yet this military explanation of the correlation between expansion and disintegration does not go very deep. For mere military conquest does not in itself ensure the acceptance

¹ In IV. C (iii) (c) 3 (a), vol. iv, pp. 465-564, below.

² Lev. xviii. 21, xx. 2; Jer. xxxii. 35.

³ For a symbolic illustration of this, see pp. 167-8, below.

of the victors' culture by the vanquished. And although the propagation of Hellenism through the Macedonian conquests in Syriac Asia and the Roman conquests in barbarian Europe is proof that this consequence may sometimes follow, this Hellenic example appears to be an exceptional case. It more frequently happens that the vanquished make the military victors their cultural captives—as the Romans themselves were captivated by the Greeks. And if a subject people fails to win this cultural compensation for its military and political discomfiture, it is likely to acquire a positive animus against the culture of its alien masters. For example, the cultural effect of Assyrian militarism was to make the Assyrians' Aramaean and Israelite victims impervious to the influence of the Babylonian culture of which the Assyrians were representatives—notwithstanding the fact that this Babylonian culture had the advantage over the Syriac culture in both antiquity and prestige. Moreover, when the Median barbarians, who had likewise been scarified by the Assyrian harrow, had to make their choice of a civilization among the existing civilizations that came within their horizon, they found the Babylonian culture of their Assyrian oppressors less attractive than the Syriac culture of their Aramaean and Israelite fellow sufferers.¹ Thus, in this Babylonian instance, the process of military conquest, so far from promoting the spread of the conquerors' culture, was a serious handicap to it. And this Babylonian experience has perhaps been commoner than the Hellenic.

The deeper explanation of our law that the geographical expansion of a society is facilitated by its disintegration is to be found in the nature of the social process by which such expansion is brought about. For, as we have seen, geographical expansion is an index of the encroachment of one society upon the domain of another; such social encroachment is accomplished by social assimilation; and this social assimilation is the outcome of 'social radiation'. This is not the place for any detailed consideration of this phenomenon, which is examined in other parts of this Study.² For our present purpose, we may confine ourselves to noting the fact that in social, as in physical, radiation a ray is a composite affair which requires to be diffracted into its elements in order to penetrate a foreign body. A composite ray of white light makes its way through a prism by disintegrating into the spectrum, in which the elementary components of white light are separated out instead of remaining fused together. The social rays in which the psychic energies of societies are radiated are similarly compounded of different elements—economic, political, and cultural—and a social ray has likewise to be

¹ See I. C (i) (b), vol. i, pp. 79-82, and II. D (v), vol. ii, pp. 137-8, above.

² See Part II. A, vol. i, p. 187, above, and V. C (i) (c) 3, vol. v, pp. 196-203, as well as Parts VIII and IX, below.

152 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
diffracted into its elementary components in order to penetrate an alien body social readily.

In successful cases of social penetration it is usually the material economic apparatus of the radiating society that works its way into the alien body social first. An Afghan or an Eskimo ventures to adopt some attractive Western 'gadget' like a rifle or a sewing-machine or a gramophone because this 'gadget' appears to be detachable from the main structure of the Western Civilization. In being offered an alien tool or toy, the stranger is not ostensibly being asked to adopt, along with it, the alien institutions and ideas and *ethos* in which this alien product has originated. If the Afghan were told that he could only obtain a rifle made in Britain on condition that he introduced the British Constitution into Afghanistan and became a convert to the Anglican Church and emancipated his womenfolk, then even his craving for the Western weapon would probably not suffice to overcome his consternation at the prospect of having to turn his whole life upside down. He would forgo the coveted rifle and content himself with his ancestral weapons rather than cease to walk in his ancestral ways. In other words, an expansive civilization does not easily penetrate an alien civilization so long as its rays remain undiffracted and therefore only play upon the alien body social in their composite form—the form in which their economic and political and cultural elements are fused together. Now this is the form in which the rays of social radiation are emitted from a civilization so long as that civilization is in process of growth. For the texture of a ray is determined by the fabric of the radiating body; and it is one of the characteristics of civilizations in process of growth that all the aspects and activities of their social life are co-ordinated into a single social whole, in which the economic, political, and cultural elements are kept in a nice adjustment with one another by an inner harmony of the growing body social. On the other hand, when a society breaks down and goes into disintegration, it is one of the symptoms of this social malady that the previous harmony between the economic, political, and cultural elements in the body social gives way to a discord; this discord in the fabric of the radiating body is reproduced, in the form of diffraction, in the rays which the body now emits; and these diffracted rays of the disintegrating civilization have greater power to penetrate the tissues of alien social bodies than the undiffracted rays which the same civilization used to emit in the time before the breakdown, when it was still in the growth stage.

This is perhaps the underlying explanation of the law, which we have inferred from empirical observation, that social disintegration

is a more favourable condition than social growth for geographical expansion.

On this showing, we are almost warranted in regarding geographical expansion as a social disease: an elephantiasis or fatty growth; a running to stalk or a running to seed; the malady of the Reptiles, who turned huge on the eve of being surpassed by the Mammals;¹ or the malady of Goliath who grew to gigantic stature in order to succumb to David; or the malady of the ponderous Spanish galleons which were routed by the English mosquito-fleet. And we may compare this disease of expansion with the mania for big buildings, which is a well-known symptom of declines and falls. In the realm of the social insects, this is the significance of the titanic scale and massive structure of the sky-scrapers built by the termites,² which make ants' nests look careless and shapeless by comparison. Yet

'In termites the amount of degeneration accompanying social evolution is . . . much greater than in the ants, and this degeneration seems to have been brought about very largely by an increasing need for protection. With greater elaboration and solidity of nest architecture the termite colonies shut themselves off more and more from the outside world; and all the castes, except the winged males and females, lost their eyes and the tough consistency of their integument. They thus came to resemble the molluscs, crustaceans and certain fishes and reptiles which have withdrawn within a heavy protective armour and have given up participating in the free competitive and co-operative life of their environment. The ants, with the exception of certain subterranean species, have not been inveigled into adopting this passive and timorous mode of life.'³

This illustration from the history of an insect society has its parallels in the histories of human civilizations. In Egyptian history, for example, the building of the Pyramids not only celebrates the triumph of the Egyptian Civilization, but registers its apogee and heralds its breakdown; and at the latter end of the story, when the breakdown has been followed by a 'Time of Troubles' and this 'Time of Troubles' by a universal state, and when 'the New Empire' has trodden for a second time the round which 'the Middle Empire' had trodden before, we find the same mania breaking out once more in the colossal temples and colossal statues of the Ramsids.⁴ In Hellenic history, again, there is no excess of bulk in the incom-

¹ See Wells, H. G.: *The Outline of History* (London 1920, Cassell), pp. 22-4, quoted in IV. C (iii) (c) 2 (γ), vol. iv, pp. 425-6, below.

² See Part III. A, p. 107, above.

⁴ For this Ramsid mania, see Meyer, E.: *Geschichte des Altertums*, vol. ii, part (i), 2nd ed. (Stuttgart and Berlin 1928, Cotta), p. 429.

parable works of art which a Pheidias and an Ictinus created for Periclean Athens; and, a century after the breakdown, Alexander can still deprecate, as a misdirection of effort and a lapse of taste, the flattering suggestion that Mount Athos shall be carved into a colossal bust in Alexander's own image.¹ In the decline of Hellenic art, the craving for colossality does not become prevalent until the Roman age. But in that penultimate age of Hellenic history the Colosseum and the Baths of Caracalla and the Baths of Diocletian and the Basilica of Constantine are colossal symptoms of the same social disease which is also manifest in the colossal dimensions of the Roman Empire itself.

Constantine, whose pile of bricks and mortar still insolently dominates the Forum, has had to steal from the monuments of his predecessors the little bas-reliefs which he requires for the ornamentation of his triumphal arch, because in Constantine's day the master of the Roman World can no longer find any living sculptor who has either the technical skill or the creative originality to carve new bas-reliefs for him. Is the excessive bulk of the basilica the monument to an 'inferiority complex' in the mind of the prince who has ordered the building and decreed its scale? Does Constantine pile concrete on concrete and rubble on rubble in order to assert his power to command material resources and to produce material effects, even if his sculptors cannot emulate the frieze of Trajan's Column or the bas-reliefs of Augustus's Altar, not to speak of the metopes of the Parthenon? And if we are right in this interpretation of Constantine's work and in this analysis of his state of mind, how are we to interpret the colossal works on which our own Western Society is expending its energies in our day: the 'skyscrapers' which we pile up on land, and the 'liners' which we launch on the ocean? By another route, we have arrived at the same question concerning our own Western destiny which has already confronted us in contemplating the spectacle of the colossal expansion of our own Western Civilization over the face of the Earth.

On this interpretation, a declining society is apt to hasten the day of its dissolution by squandering its diminishing store of vital energy in material performances on an excessive scale, not so much out of a wanton megalomania as in a vain effort to give the lie to its own unacknowledged but agonizing consciousness of incompetence and failure and doom.

(b) INCREASING COMMAND OVER THE PHYSICAL ENVIRONMENT

Perhaps we may now take it as proved that the criterion of the growth of a civilization is not to be found in the progressive and

¹ Plutarch, *Life of Alexander*, ch. lxxii.

cumulative conquest of the human environment, as measured on the index of geographical expansion. We have next to see whether the conquest of the physical environment will provide us with the criterion for which we are in search; and in this field the obvious index of progress is an improvement in technique. Between an improvement in technique and a progress in the conquest of the physical environment, a definite correlation may fairly be assumed to exist. Is there evidence of an equally definite correlation between an improvement in technique and a progress in social growth?

This latter correlation is taken for granted in a classification—invented by our modern Western sociologists and readily accepted by the popular Western mind—in which a supposed series of stages in the improvement of material technique is taken as indicative of a corresponding succession of chapters in 'the progress of Civilization'. In this scheme of thought, human progress is represented as a sequence of 'ages' which are distinguished by technological labels: the Palaeolithic Age, the Neolithic Age, the Chalcolithic Age, the Copper Age, the Bronze Age, and the Iron Age, with a grand culmination—or climacteric—in the Machine Age in which our latter-day *Homo Occidentalis* has been privileged to live. In spite of the wide currency which this classification enjoys in our day, it will be wise to examine it critically; for, without prejudice to the empirical test, we can point out several grounds on which it is suspect even *a priori*.

It is suspect, in the first place, by reason of its very popularity; for the hold which this classification has obtained over the popular mind is not due to any reasoned intellectual conviction of its theoretical merits. The technological classification has been accepted widely and uncritically because it has appealed to the emotions of a society which has been fascinated by its own recent technical triumphs. In inventing this scheme of thought, our sociologists have caught the popular fancy; but in their own mental process they themselves have succumbed to the subtle and insidious influence which a historian's local and temporary environment always and everywhere exerts upon the trend of his historical studies. This is a phenomenon which we have examined in general terms already;¹ and we may therefore absolve ourselves from re-examining it here *ad hoc*, and may pass on to our next point forthwith.

A second reason for regarding the technological classification of social progress as suspect *a priori* is because it is a manifest instance of another phenomenon which we have also examined above:² the tendency for a student to become the slave of the particular materials

¹ See Part I. A, above, vol. i.

² See the present Study, loc. cit.

for study which have come into his hands by chance. From the scientific standpoint, it is a mere accident of no scientific significance that the material tools which Man has made for himself should have a greater capacity to survive, after they have been thrown on the scrap-heap, than Man's psychic artifacts: his institutions and feelings and ideas. Actually, while this mental apparatus is in use, it plays a vastly more important part than any material apparatus can ever play in human lives; yet because of the accident that a discarded material apparatus leaves, and a discarded psychic apparatus does not leave, a tangible detritus, and because it is the *métier* of the archaeologist to deal with human detritus in the hope of extracting from it a knowledge of human history, the archaeological mind tends to picture *Homo Sapiens* as *Homo Faber par excellence*.

"The spoken word does not fall to the ground, like the spent missile or the broken vessel, to be its own memorial of human achievement: it vanishes in air, so that the philologist deals not with originals, but at best with the reminiscence of an echo. To recover, therefore, what men were doing, or making, still more what they were thinking or desiring, before the dawn of History, the sole available method is that of the archaeologist, merging as it does in that of the geologist: since these alone handle and interpret original creations of men's thought and will, and contemporary elements of the physical surroundings of those men. Where the tree falls, there shall it lie, and where the lost implement or shattered potsherd or worn-out man fell, there have they lain, for all that any one cared then or knows now."¹

In this eloquent passage we discern the archaeologist's natural bias, against which it behoves the historian to be on his guard.

A third *a priori* ground for treating the technological classification of progress as suspect is because this is a flagrant example of the fallacy of thinking of Growth, with a big 'G', as a single movement in a straight line, and of Civilization, with a big 'C', as a unitary and unique process. This, again, is a phenomenon which we have examined before in a general way;² and in this place we need only observe, *ad hoc*, that even if we were to accept the technological classification as valid, we should still find it quite impossible to construct a single framework within which all the relevant facts could be brought into order.

To begin with, the framework could not be made world-wide; for, in every age of which a record survives, each stage in the technological series that has ever been passed through by any human society up to that date has always continued to be represented, side

¹ Myres, J. L., in *The Cambridge Ancient History*, vol. i, 2nd ed. (Cambridge 1924, University Press), pp. 1-2.

² In Part I. C (iii) (b), vol. i, above.

by side with each subsequent stage so far attained, by some living society in some locality. Scandinavia, for example, may remain in the Stone Age for thousands of years after Egypt or Shinar, or even the less distant Aegean, has taken to bronze; and then, when Scandinavia has followed the example of her neighbours by discarding stone for bronze in her own good time, she may cling to bronze for centuries after her neighbours have discarded this metal for iron.¹ Even at the present day, when the expansion of our own Western Civilization and the concomitant 'Westernization' of the other living societies has gone so far as it has towards bringing about a social unification of the whole World on a Western basis, we can still find living representatives of every stage of technique, from the recent machine-age technique, which has given our modern Western Society its unprecedented material 'drive', back to the stone-age technique which is still practised by the Esquimaux and by the Australian Blackfellows.

In fact, there is not, and never has been, any such thing as *the* Machine Age or *the* Palaeolithic Age with a capital letter. For all that we know, the older techniques, from flint-chipping to iron-smelting inclusive, may each have been invented a number of times over by different societies in different times and places. At least, this remains a possible hypothesis in the absence of any historical record of their origins. Yet even if we make the assumption that each of the earlier techniques has anticipated the history of the machine-technique in being invented at some single time and place,² we still cannot revert to the diagram of a unitary movement in a straight line. For if the invention of each technique has been a unique event, the new knowledge cannot have spread instantaneously, by some kind of miraculous intuition, from the minds of its inventors, at one particular place, into the minds of all the rest of Mankind in all other parts of the World. An invention does not make 'a clean cut' between two epochs of World History. It rather sets in motion a wave of mimesis; and this psychic wave behaves like other waves in other media. It travels outward in different directions from its point of origin; it takes time to travel; and it takes a different length of time in different sectors, according to the size and disposition of the local obstacles which it encounters, and the degree of the local resistance which it has to overcome. The farther a wave spreads, the more it tends to lose the original regularity of its formation; and in fact we find that the successive waves of human technique have reached different parts of the World in

¹ This technological 'time-lag' in Ancient Scandinavia has been noticed in II. D (vii), vol. ii, on p. 342, footnote 3, above.

² For the controversy between the advocates of the Uniformity Theory and the advocates of the Diffusion Theory, see I. C (iii) (b), Annex, vol. i, above.

158 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
different orders, and that certain societies have never been reached by certain waves at all. For example, the Egyptian Society never transcended the Bronze Age nor the Mayan Society the Stone Age from beginning to end of their respective growths; and no known society except our own Western Society has ever converted the Iron Age into the Machine Age. Yet we shall scarcely have the audacity to measure off the growths of civilizations on this index, and to place our own civilization at the top and the Mayan at the bottom of the scale on this account.¹

And even if we were rashly to accept the assumption that improvement in technique is the criterion of progress in growth, we should still have to define what we mean by the word 'improvement' in this context. Are we to think of improvement in the utilitarian sense, in terms of the material results accomplished, or are we to think of it in the spiritual sense, in terms of the challenge and the difficulty surmounted and the energy exerted and the creative power put forth? If we think in these latter terms—and they are the only terms tolerable to the human spirit—then we shall incline to the opinion that, in the development of technique, *c'est le premier pas qui coûte*. The transmission of the human voice by telephone or wireless is not so miraculous as the origin of articulate language (without which the technique of transmitting sounds would be of no value). The application of fire to drive steam-engines or to shoot guns is not so daring as the original mastery of fire: the discovery of how to handle it with impunity and how to keep it alight and how to rekindle it when it has gone out. The invention of fire-arms, again, has been intellectually easier than the invention of the first missile weapons: The bow-and-arrow represents a greater intellectual triumph than 'Big Bertha'. On the same showing, the solid wheel of the primitive ox-cart is more wonderful than the locomotive or the motor-car, the dug-out canoe than the liner, the flint implement than the steam-hammer. And it has been a harder task to domesticate animals and plants than to dominate

¹ It is in its application to the Mayan Civilization and the other civilizations of the New World that the modern Western technological index of the growths of civilizations finds its *reductio ad absurdum*.

'Not only in Peru, but also in Central America and in Mexico, the Indians lived in a high state of culture during the stone age. The copper and bronze ages are not synonyms of an essentially higher civilization in America. It only means that in certain regions the Indians had achieved a considerable measure of progress. The bronze age does not mark the adoption of a new civilization but only an amplification of the copper culture in Peru, and the transition from the stone age to the copper age means nothing more than a further step in development, and not the accession of a new people with a new culture. The earliest Maya inscriptions on immovable objects date from the first centuries A.D., and at that time the wonderful calendar of the Mayas had already been perfected. Then, as very much later, the Mayas were a stone-age people. At Paracas in Peru, Tello has discovered the remains of a civilization in which especially the art of weaving was on a marvellously high level, although no other metal than gold was known.' (Nordenskiöld, E.: *Origin of the Indian Civilizations in South America* (Göteborg 1931, Elander), p. 40.)

Inanimate Nature—to harness the horse than to harness the tide. Inanimate Nature obeys regular laws which Man has merely to work out in order to apply them mechanically for his own practical purposes. It is infinitely harder to cope with the waywardness and complexity of Life; and the peasant and the Nomad, who have discovered the art of governing the Vegetable and the Animal Kingdoms, may smile sardonically at the boastful industrialist who glories in his facile conquest of the material universe and has not paused to remind himself that 'the proper study of Mankind is Man'.¹

"Though I have the gift of prophecy, and understand all mysteries and all knowledge; and though I have all faith, so that I could remove mountains, and have not charity, I am nothing."²

The industrialist has concentrated all his effort and attention upon the relations of Man with Physical Nature to the neglect of the relations between Man and Man; and he has thus heightened the effect—for good or for evil—of every human action by putting at its disposal a terrific driving-power, without having taken thought to improve the wisdom or the virtue of the human beings whom he has been endowing so recklessly with these improved technical facilities. In the light of the event, we can see at this eleventh hour that Daedalus would have done better to follow the lead of Cain and Abel by seeking to crown their conquests of the Vegetable and Animal kingdoms with the conquest of the highest kingdom in the world of Life: the Kingdom of Man. And, in this realm of human relations, charity is of more account than clock-work.

These *a priori* objections to the technological diagram of human progress are almost sufficient in themselves to rule out the idea of taking an improvement in technique as the criterion of social growth. If we now apply our well-tried empirical test, we shall find that it will give this popular hypothetical correlation its *coup de grâce*. A survey of some of the relevant facts will show us cases of technique improving while civilizations remain static or go into decline,³ as well as examples of the converse situation, in which technique remains static while civilizations are in movement—either forward or backward as the case may be.

For instance, a high technique has been developed by every one of the arrested civilizations. The Polynesians have excelled as navigators, the Esquimaux as fishermen, the Spartans as soldiers, the Nomads as tamers of horses, the 'Osmanlis as tamers of men.

¹ Pope: *Essay on Man*, Epistle ii, l. 2.

² 1 Corinthians xiii. 2.

³ This point is noticed by Turgot in his *Second Discours sur les Progrès Successifs de l'Esprit Humain* (*Œuvres de Turgot*, Nouvelle Edition (Paris 1844, Guillaumin, 2 vols.), vol. ii, p. 608).

These are all instances in which civilizations have remained static while technique has improved.

An example of technique improving while a civilization declines is afforded by the contrast between the Upper Palaeolithic Age in Europe and the Lower Neolithic, which is its immediate successor in the technological series. The Upper Palaeolithic Society remained content with implements of rough workmanship, but it developed a fine aesthetic sense, and it did not neglect to discover certain simple means of giving its sense a pictorial expression. The deft and vivid charcoal sketches of animals, which survive on the walls of Palaeolithic Man's cave-dwellings, where they have been discovered by our modern archaeologists, excite our astonishment and admiration. The Lower Neolithic Society took infinite pains to equip itself with finely ground tools, and possibly turned these tools to account by using them as weapons in a struggle for existence with Palaeolithic Man in which *Homo Pictor* went down and left *Homo Faber* master of the field. In any case, the Palaeolithic Society vanished away and the Neolithic Society reigned in its stead; and this change, which inaugurates a striking improvement in terms of technique, is distinctly a set-back in terms of civilization. For the art of Upper Palaeolithic Man died out with him; and if Lower Neolithic Man had any glimmering of aesthetic sense at all, at any rate he has given no material expression to it.¹

Another example of an improvement in technique being coincident with a set-back in civilization is to be found in the interregnum in which the Minoan Civilization went into dissolution. The Minoan Society had remained in the Bronze Age from beginning to end of its history. The latest and most barbarous swarm of Continental European barbarians who descended upon the derelict domain of the Minoan Society in the post-Minoan *Völkerwanderung* came armed with weapons of iron instead of bronze; and in their victorious onslaught upon the epigoni of the Minoan Civilization they doubtless profited from their acquaintance with the more potent metal. Yet this victory of the iron-sworded 'Dorians' over the bronze-sworded Minoans was a victory of Barbarism over Civilization. For an iron sword—or, for that matter, a steel tank or submarine or bombing-plane or any other killing-machine of our latter-day Machine Age—may be a talisman of victory without being a talisman of culture. When the 'Dorians' adopted weapons of iron instead of weapons of bronze, they did not cease to be barbarians. And there is no reason for crediting these barbarians even

¹ There is a suggestive passage on the cultural contrast between Lower Neolithic Man and Upper Palaeolithic Man in Wells, H. G.: *The Outline of History* (London 1920, Cassell), pp. 64-7.

with the technical achievement of discovering a new and better material for metallurgy. The 'Dorian' iron was probably no 'Dorian' original discovery, but simply a 'Dorian' loan which a geographical accident had put these barbarians in the way of making by mimesis from the skilled artificers of a neighbouring region.¹ In this encounter between the 'Dorians' and the Minoans, the technological criterion of progress in civilization is confuted by a *reductio ad absurdum*; for by the technological criterion we are constrained to declare that the nadir of the post-Minoan interregnum witnessed an advance in the culture of the Aegean area; that this advance was more significant than any which had been achieved in the whole history of the Minoan Civilization; and that the advance was brought about by the invading bands of iron-sworded 'Dorians' at the moment when they were using their iron weapons to deal the bronze-sworded Minoan culture its death-blow.

This example from the history of the Old World has a parallel in the history of the New World which is remarkably exact.

The establishment of Mayan and Toltec chronology fixes, within relatively narrow limits, the beginning of the metal age in Central America and Mexico. No specimen of metal, not even a copper stain, was observed during excavations at Copan, Quirigua and other Mayan cities of the First Empire. Las Quebradas in Guatemala was actually built upon a placer mine; yet, in the sluicing operations which have almost destroyed the site, no specimen of worked gold has been found. Nor are any ornaments of metal, such as gorgets and bells, pictured on the early monuments. We therefore conclude that the metal age did not begin till after 600 A.D.; yet by 1200 A.D. metal-work was highly developed in gold, silver, copper and various alloys. Many specimens found at Chichen Itza in Northern Yucatan are of Costa Rican and Colombian origin, and the technique of metal-working is the same from

¹ According to the Hellenic tradition, the inventors of iron-working were the Chalybes: a people whose habitat in the fifth century B.C., when this tradition was current, was the Black Sea coast of Anatolia in the neighbourhood of Trebizond. If the technique of iron-working really came to the Aegean from this quarter, it might have reached the 'Dorians', via the Black Sea and the Danube, before it reached the Minoans at Cnossos or Mycenae; for the 'Dorians', on the eve of the post-Minoan Völkerwanderung, were presumably living somewhere in the Continental European hinterland of the Aegean area. The Chalybes of the Hellenic tradition, like the Tubal-Cain of the Syriac tradition who was 'an instructor of every artificer in brass and iron' (Gen. iv. 22), may be presumed to represent the Hittite culture. (The Tubal and Meshech of Gen. x. 2 stand for the Tibareni and Moschi: two swarms of barbarians from the Caucasian hinterland of the Hittite World who drifted into the former Hittite domain in Eastern Anatolia after the overthrow of the Khatti Power in the twelfth century B.C.) The historical Chalybes, as the Greeks found them when the Hellenic Society expanded into the Black Sea from the seventh century B.C. onwards, were apparently in a low state of culture. We may account for this by supposing that they were a primitive people who had simply served to transmit the art of iron-working from its Hittite homeland in East-Central Anatolia to the Balkan Peninsula via the Black Sea. Or else we may suppose that the historical Chalybes were a remnant of the Hittite Society which had been saved, by its sheltered situation, from being involved in a catastrophe which had overwhelmed the rest of the Hittite World at the beginning of the twelfth century B.C. In that case, the Chalybes must have relapsed into barbarism—in everything except their metallurgical technique—in consequence of their isolation.

162 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
Southern Colombia to Central Mexico. The art was apparently introduced from South America about A.D. 1000 and underwent a rapid growth in the five hundred years before the Spanish conquest.¹

It will be seen that this illustration of our thesis from Central America and the preceding illustration from the Aegean throw some light upon one another. Just as in the Old World the Minoan Society performed its achievements and lived out its life without ever transcending the Bronze Age, so in the New World the Mayan Society rose and fell without ever passing out of the Stone Age into an age of metal. In Central America, the introduction of the metallurgical technique was reserved for two civilizations, both related to the Mayan, which can neither of them compare with the antecedent civilization in respect of the general level of their cultural attainments. And, here again, the technological advance was synchronous with a cultural interregnum.

If it be a *reductio ad absurdum* of the technological criterion to claim that the second-rate civilizations which were affiliated to the Mayan Civilization or the barbarian invaders of the Aegean World in the post-Minoan and pre-Hellenic interregnum were apostles of civilization in virtue of their prowess in technique, it is amusing to find an equally extravagant claim being submitted in all solemnity by the last of the great Hellenic historians on behalf of the post-Hellenic interregnum on a similar technological ground.

Procopius of Caesarea wrote a history of the wars of the Roman Emperor Justinian (*imperabat* A.D. 527-65); and these wars were actually the death of the ancient Hellenic Society. In obstinately striving to realize his misguided ambition of restoring the territorial integrity of the Empire, Justinian brought financial ruin upon the Oriental provinces, depopulation upon the Balkan provinces, and devastation upon Italy; and even at that price he failed to achieve his 'single-track' aim; for in extirpating the Vandals in Africa he was clearing the way for the Moors to take their place, and in extirpating the Ostrogoths in Italy he was creating a vacuum which was to be filled, within three years of his own death, by the far more barbarous Lombards. The century which followed the wars of Justinian was actually the nadir of the post-Hellenic interregnum. This was the tragedy of the generation of Procopius, as posterity can see it in retrospect; and indeed it was painfully apparent at the time, and was widely recognized by Procopius's own contemporaries, that—however far or near the end of Hellenism might be—Hellenic history had long passed its zenith. Yet in writing the preface to his narrative of the fatal events which had

¹ *The Encyclopaedia Britannica*: Supplementary Volumes constituting the Thirteenth Edition (London and New York 1926), vol. i, p. 195, s.v. 'Archaeology'.

just dealt Hellenism its death-blow before he took up his pen, the eminent historian goes out of his way to break a lance in a battle of his own seeking between the Moderns and the Ancients; and he awards the palm to the Moderns on the score of their technical superiority in the art of war.

"To an unprejudiced mind it will be evident that the events of these wars are at least as striking and imposing as any in history. They have been responsible for occurrences of a more extraordinary character than any of which a record survives, except (possibly) from the point of view of a reader who insists upon giving the palm to Antiquity and refuses to be impressed by anything in the contemporary world. The first example that occurs to my mind is the affectation of alluding to modern troops as "archers" and reserving such appellations as "hand-to-hand combatants" or "men-at-arms" for the warriors of Antiquity, in the confident assumption that in our day these military qualities are extinct. Such assumptions merely betray a superficiality and an utter lack of experience in those who make them. It has never crossed their minds that the archers in Homer, whose arm is cast up against them as an opprobrious epithet, had no horse-flesh between their knees, no lance in hand, and no shield or body-armour to cover them. They went into action on foot and were compelled to take cover, either by posting themselves behind the shield of a comrade or by "leaning against a tombstone"—a position which precluded them equally from extricating themselves in defeat and from pursuing a retreating enemy, and, above all, from fighting in the open. Hence their reputation for playing an underhand part in the game of war; while, apart from that, they took so little pains with their technique that, in shooting, they only drew the bow-string to the breast, with the natural result that the missile was spent and ineffective by the time when it reached its target. This was undoubtedly the level at which archery stood in earlier times. By contrast, modern archers go into action equipped with cuirasses and knee-boots and with their quiver on their right side and their sword on the other, while some troopers have a lance slung over their shoulders and a small handleless shield of just sufficient diameter to cover the face and neck. Being admirable horsemen, they are trained to bend their bow without effort to either flank when going at full gallop, and to hit a pursuing enemy in their rear as well as a retreating enemy to their front. They draw the bow-string to the face, to the level (approximately) of the right ear, which imparts such force to the missile that its impact is invariably fatal and that neither shield nor cuirass can resist its momentum. Some people, however, who choose to ignore the existence of these troops, persist in an open-mouthed adulation of Antiquity and refuse to admit the superiority of modern inventions. Misconceptions of this kind are, of course, powerless to rob the late wars of their superlative interest and importance."¹

Procopius's argument is an extravaganza which refutes itself; and the only comment that it seems necessary to make is that the

¹ Procopius of Caesarea: *A History of the Wars of Justinian*, Bk. I, ch. 1.

cataphract, whom Procopius presents to his readers as the *chef d'œuvre* of Greek and Roman military technique—the most efficient type of fighting-man that had ever been thrown up in the Hellenic World during the long span of time between the Homeric Age and the author's own day—was actually no more an original creation of the Greek or the Roman military genius than iron was a discovery of the 'Dorians'. This horse-archer—armed cap-à-pie and formidable by reason of his personal prowess in riding and shooting—was utterly alien from the genuine Greek and Roman military tradition, which had relegated its cavalry to a subordinate role and had put its trust in an infantry whose strength lay in the corporate cohesion and discipline of the regiment far more than in the equipment or *expertise* of the individual soldier. In the Roman Army, the cataphract was a recent innovation—an arm which had not been adopted more than a couple of centuries before Procopius's own day—and if this arm had come to be the mainstay of Roman military power within that relatively short period of time, this revolution in military technique bears witness to the historic Roman infantry's rapid and lamentable decay. In fact, in the Roman Army of Procopius's day the cataphract filled a vacuum which had been of the cataphract's own making; for the previously invincible Roman infantryman had first met his match, and finally acknowledged his superior, in the cataphract whom he encountered on the Mesopotamian plains in the armies of the Arsacidae and the Sasanidae, and on the Danubian plains in the war-bands of the Sarmatians and the Goths. The military lessons of a long trial of strength between the legionary and the cataphract, which had begun with Crassus's disaster at Carrhae in 53 B.C. and had culminated in Valens' disaster at Adrianople in A.D. 378, had ultimately led the Roman authorities to discard the historic Roman infantryman—through whose sword and trenching-tool Dea Roma had originally won her Empire—and to adopt the exotic but triumphant Oriental cataphract in the legionary's stead.

In his eulogy of the cataphract,¹ Procopius is thus really doing just the opposite of what he supposes and intends. Instead of celebrating an improvement of the Greek and Roman military tech-

¹ In the detailed description of the cataphract's equipment which this eulogy contains in the passage quoted above, Procopius has forgotten to mention one detail which would have been germane to his purpose and which is actually mentioned in a handbook of military technique which dates from the next generation: the *Strategikon* of the Emperor Maurice (*imperabat* A.D. 582–602). From Maurice's *Strategikon* we learn that the cataphract was equipped with 'stirrups: an invention which had cropped up since the fifth century without our being able to say from whom it had its origin'. (Oman, Sir Charles: *A History of the Art of War in the Middle Ages from the Fourth to the Fourteenth Century* (London 1898, Methuen), p. 185.) The first reference to stirrups in Chinese literature is said to date from A.D. 477 (Münsterberg, O.: *Chinesische Kunstgeschichte*, vol. i (Esslingen 1910 Neff), p. 162).

nique, he is pronouncing its funeral oration. Yet, although Procopius has chosen an unfortunate illustration of the point that he is seeking to make, his general contention that there has been a progressive improvement in Hellenic technique remains broadly true within the field of military technique to which he confines his argument. In surveying this field of Greek and Roman social history, let us rule out of account the spurious epilogue represented by the cataphract and confine our survey to the thousand years which began with the invention¹ of the Spartan phalanx in the second Messeno-Spartan War in the latter part of the seventh century B.C.² and which ended with the final discomfiture and discrediting of the Roman legion at the Battle of Adrianople in A.D. 378. The development of the genuinely Hellenic military technique can be traced, without any break in continuity, throughout these thousand years; and in tracing it we shall find that an arrest or a set-back in the Hellenic Civilization invariably accompanied an improvement in the Hellenic art of war.

To begin with, as we have seen already, the invention of the Spartan phalanx, which is the first signal improvement of which we have a record, was an outcome of the same events that brought the growth of the Spartan version of the Hellenic Civilization to a premature halt.³

The next signal improvement was the differentiation of the Hellenic infantryman into two extreme types: the Macedonian phalangite and the Athenian peltast. The Macedonian phalanx, armed with long two-handed pikes in place of short one-handed stabbing-spears, was more formidable in its impact than its Spartan precursor; but it was also more unwieldy in its manœuvres and more at the enemy's mercy if once it lost its formation; and therefore it could not safely go into action unless its flanks were guarded by peltasts: a new type of light infantry who were taken out of the

¹ 'Adoption', rather than 'invention', is perhaps the right word in this case, since the phalanx formation and tactics, as we have seen above (in I. C. (iii) (b), Annex, vol. i, p. 428, footnote 2), appear to have originated in the Sumeric World and to have spread thence to the Hellenic World. In the *Iliad*, the phalanx-technique makes its appearance side by side with older and cruder kinds of armament and tactics. In *Iliad* xiii, ll. 126-35 (cp. l. 680), there is a detailed description of phalanx-fighting; and in *Iliad* xvi, ll. 211-17 (cp. l. 248), the Myrmidons go into battle in phalanx-order. On the other hand, in *Iliad* xiii, ll. 712-18, the Locrians are described as bowmen who are destitute of the phalangite's panoply. This panoply—the metal helmet and corselet, and the comparatively small round metal shield—appears to have been introduced into the Aegean from Assyria in the fourteenth century B.C. This material equipment, and the formation and tactics that it rendered possible, were technically as much superior to the indigenous Minoan equipment and tactics as the cataphract, in his turn, was superior to the hoplite. It is noteworthy that each of these great technical advances in the art of war was introduced during a cultural interregnum: the hoplite during the post-Minoan interregnum and the cataphract during the post-Hellenic interregnum. (See Glotz, G.: *La Civilisation Égée* (Paris 1923, Renaissance de Livres), pp. 100-1 and 103.)

² For the general social effects of this war in arresting the growth of the Spartan Society, see the present Part, Section A, pp. 53-68, above.

³ See the preceding footnote.

ranks and trained to fight as skirmishers. In collaboration, the Macedonian phalangite and the Athenian peltast were a far more effective type of infantry than the old undifferentiated phalangite on the Spartan model;¹ and this second improvement in the Hellenic military technique was the outcome of a century of internecine warfare in the Hellenic World—the century running from the outbreak of the Atheno-Peloponnesian War in 431 B.C. to the Macedonian victory at Chaeronea in 338—which saw the Hellenic Civilization break down and go into disintegration.

The next signal improvement in the Hellenic military technique was made by the Romans, when they succeeded in combining the advantages and avoiding the defects of both peltast and phalangite in the tactics and equipment of the legionary. The legionary was armed with a couple of throwing-spears and a stabbing-sword, and the legion went into action in open order in two waves, with a third wave—armed and ordered in the old-fashioned phalanx-style—in reserve. This third improvement in the Hellenic military technique was the outcome of a fresh bout of internecine warfare—beginning with the outbreak of the Hannibalic War in 218 B.C. and closing with the end of the Third Romano-Macedonian War in 168—in which the Romans delivered a ‘knock-out blow’ to every other Great Power in the Hellenic World of that age.

The fourth and last improvement was the perfection of the legion: a process, begun by Marius and completed by Caesar, which was the outcome of a century of Roman revolutions and civil wars.² The Roman legionary was probably at his best in the army which fought for Caesar at Pharsalus in 48 B.C.—five years after the legions which had fought for Crassus at Carrhae in 53 B.C. had met their match in the Parthian cataphracts. Thus the generation of Caesar and Crassus saw the Greek and Roman military technique both attain and pass its zenith. And the same generation saw the Hellenic Civilization enter upon the penultimate stage in its decline and fall. For that century of Roman revolutions and civil wars which had begun in 133 B.C. with the tribunate of Tiberius

¹ The inability of the old-fashioned Spartan hoplite phalanx to cope with enemy peltasts unaided was demonstrated in the action fought at Lechaem in 390 B.C., when the Athenian commander Iphicrates, with his peltasts, cut up a *mora* (division) of Lacedaemonian infantry which was on the march unescorted by friendly cavalry. (See Xenophon: *Hellenica*, Bk. IV, ch. v, 11–17.)

² In terms of our modern Western military history, the homogeneous but versatile Roman infantry of the last century B.C. may be compared with our nineteenth-century infantry, with its uniform equipment of rifle and bayonet. The slightly differentiated Roman infantry of the second century B.C. may be compared with our eighteenth-century infantry, in which the light company and the grenadier company of a battalion were armed and trained somewhat differently from the ordinary troops of the line. The sharply differentiated Macedonian infantry of the third century B.C. may be compared with our seventeenth-century infantry, which was likewise sharply differentiated into pikemen and musketeers and targeteers.

Gracchus had been the climax of the Hellenic 'Time of Troubles'; and it was Caesar's mission to bring that 'Time of Troubles' to a close by inaugurating the universal state which Augustus eventually established after the Battle of Actium.

In this history of the successive improvements in the Hellenic art of war, we have a clear case in which it is not the growth of a civilization, but its arrest and breakdown and disintegration, that goes hand in hand with the improvements in its military technique; and the histories of the Babylonian and Sinic civilizations offer us equally good illustrations of the same phenomenon. Both in the Babylonian 'Time of Troubles', when the Babylonian Society was tearing itself to pieces in the frenzy of Assyrian militarism, and likewise in the Sinic 'Time of Troubles', when the military Power of Ts'in was delivering knock-out blows to the other contending states of the Sinic World, conspicuous improvements in military technique were accomplished. In both cases, for example, the old-fashioned use of the war-horse as a draught-animal to draw a chariot was discarded in favour of its more effective use as a mount for a cavalryman.¹ Perhaps we may infer from the foregoing survey that an improvement in military technique is usually, if not invariably, the symptom of a decline in civilization.

An Englishman of the generation that has lived through the General War of 1914-18 may remind himself, in this connexion, of an incident which struck him, at the time, as painfully symbolic. As the War, in its ever-increasing intensity, made wider and wider demands upon the lives of the belligerent nations—like some great river that has burst its bounds in flood and is engulfing field after field and sweeping away village after village—a moment came in England when the offices of the Board of Education in Whitehall were commandeered for the use of a new department of the War Office which had been improvised in order to make an intensive study of trench warfare. The ejected Board of Education found asylum in the Victoria and Albert Museum, where it survived on sufferance as though it had been some curious relic of a vanished past. And thus, for several years before the Armistice of the 11th November, 1918, an education for slaughter was being promoted,

¹ In Sinic military history, the substitution of cavalry for chariots is known not to have been an original invention of the Sinic Society, but to have been borrowed by the Sinic World from the Nomads of Eurasia, with whom the Sinic World, in the course of its expansion, had come into contact about the fourth-century B.C. The innovation is attributed to Wu-ling (*regnabat* 329-299 B.C.), the prince of the north-eastern frontier-state of Chao. (See Hirth, F.: *The Ancient History of China* (reprint: New York 1923, Columbia University Press), pp. 272-3; and Maspéro, H.: *La Chine Antique* (Paris 1927, Boccard), p. 385.) May we conjecture, on this analogy, that the introduction of the cavalry arm into the Assyrian Army at about the turn of the eighth and seventh centuries B.C. was likewise an outcome of contact with the Eurasian Nomads? This was just the time when the Cimmerian and Scythian Nomads were breaking out of the south-western corner of the Eurasian Steppe and over running Asia Minor.

in the heart of our Western World, within the walls of a public building which had been erected in order to assist in promoting an education for life. As the writer of this Study was walking down Whitehall one day in the spring of that year 1918, he found himself repeating a passage from the Gospel according to Saint Matthew:

'When ye therefore shall see the abomination of desolation, spoken of by Daniel the Prophet, stand in the holy place, (whoso readeth, let him understand), . . . then shall be great tribulation, such as was not since the beginning of the World to this time. . . . And, except those days should be shortened, there should no flesh be saved. . . .'¹

No reader can fail to understand that when the Ministry of Education of a great Western country is given over to the study of the art of war, the improvement in our Western military technique which is purchased at such a price is synonymous with the destruction of our Western Civilization.

Nor is the art of war the only kind of technique that is apt to make its progress in inverse ratio to the general progress of the body social. War is so manifestly an anti-social activity that an antinomy between military progress and social progress is not surprising. And we shall notice in retrospect that, in all the examples of the correlation between technical improvement and social arrest or setback which we have passed in review up to this point, the technique that has achieved improvement at Society's expense has been more or less military in each instance. Let us now take the case of a technique which stands at the furthest remove from the art of war: the technique of agriculture, which is generally regarded as *par excellence* the sovereign art of peace. If we revert to the history of the Hellenic Civilization, and trace out the course of the successive improvements in the Hellenic technique of agriculture against the general background of Hellenic history, we shall find here another instance in which an improvement in a technique has been the accompaniment of a decline in a civilization.

At the outset, perhaps, we seem to be entering here upon a different story. Whereas the first historic improvement in the Hellenic art of war was purchased at the price of an arrest in the growth of the particular Hellenic community by which this improvement had been invented, the first comparable improvement in Hellenic agriculture had a happier sequel. In the domain of agricultural technique, the first Hellenic innovators were not the Spartans but the Athenians; and when Attica, on Solon's initiative, led the way in Hellas from a régime of mixed farming for subsistence

¹ Matt. xxiv. 15 and 21-2.

to a régime of specialized agricultural production for export,¹ this technical advance, so far from being followed by an arrest or decline of civilization in the locality where the advance had been made, was actually followed by an outburst of energy and growth in every sphere of Attic life—an outburst which had so powerful an *élan* that its influence was not confined to Attic soil but went coursing, in a great current of new vitality, through the veins of the whole Hellenic body social.

In the next chapter, however, the story of the successive improvements in the Hellenic agricultural technique takes a different, and this time a sinister, turn. The next stage of technical advance was an increase of scale in the operations of the new specialized agriculture through the organization of mass-production. This step appears to have been taken in the colonial Hellenic communities which had been planted overseas in Sicily; for the Sicilian Greeks found an expanding market for their wine and oil among the barbarians of the Western Mediterranean who had acquired a taste for the fruits of the vine and the olive without having yet learnt to plant vineyards and oliveyards for themselves. Our first glimpse of the newfangled Attic agriculture on the new colonial scale is in the territory of the Sicilian Greek city-state of Agrigentum towards the close of the first quarter of the fifth century B.C.; and the description which we have of it from the pen of a later Sicilian Greek historian shows that this second advance in Hellenic agricultural technique was vitiated socially from the start by being bound up with the employment of slave-labour.

'After the victory [of the allied Greek city-states of Sicily over the Carthaginians at the Battle of Himera in 480 B.C.], Gelo . . . divided the bulk of the spoils,² including the prisoners of war, among the Greek allies in proportion to the strengths of the forces which they had respectively put into the field. The Governments put the prisoners allotted to them into fetters, and employed them on public works. The Agrigentines received the largest number, and were able to improve their countryside as well as their city. The number of captives in their hands was so great that many private people there possessed as many as 500—the number being due not only to the large size of the force which they had sent on the campaign but also to the accident that, when the Carthaginian rout began, many of the fugitives retreated inland, and this mostly into Agrigentine territory. These stragglers were all caught by the Agrigentines, so that the city was positively packed with captives. Most of them were nationalized, and these were put to quarrying stone for public works [which the author goes on to enumerate and describe]. . . .

¹ For the causes of this Attic agrarian revolution of the sixth century B.C., see Part II. D (ii), vol. ii, pp. 37–42, above.

² After disposing of some of them as rewards for distinguished valour, and reserving others for dedication in the temples of Himera and Syracuse. A. J. T.

Besides this, they planted the whole of their territory, which had a good soil, with vineyards and with orchards of all kinds of fruit trees, which brought them in a great income from the land.¹

The great technical advance which was achieved in this agrarian revolution was offset by at least as great a social lapse; for the new plantation-slavery, with which the new plantation-agriculture was bound up, was a far more serious social evil than the old domestic slavery which was the only form of the institution that had existed in Hellas before. The plantation-slavery was worse, both morally and statistically. It was impersonal and inhuman, and it was on the grand scale.

This system of agricultural mass-production by slave-labour for a barbarian market spread from the Greek communities in Sicily to adjoining regions in the Western Mediterranean Basin which came within the ambit of the Hellenic Civilization: first to the Carthaginian dominions in North-West Africa and then, on a larger scale, to the great area in Southern Italy which was left derelict and devastated by the Hannibalic War.² Wherever this slave-plantation system of agriculture established itself, it notably increased the productivity of the land in the purely economic terms of the profits accruing to the entrepreneurs who bought or leased or squatted on the land and planted it with vines and olives and stocked it with slaves; but, by the same token, the system made the land socially sterile; for, wherever the slave-plantations spread, they displaced and pauperized the peasant and the yeoman farmer as inexorably as bad money drives out good.

The social consequence was the depopulation of the countryside and the creation of a parasitic urban proletariat in the cities;³ and this fatal path of social development was a 'one-way street'. Not all the efforts of successive generations of Roman social reformers—not the revolutionary political measures of the hot-blooded

¹ Diodorus of Agyrium, *A Library of Universal History*, Book xi, chap. 25.

² It must be confessed that the malignant social effects which followed upon the second signal advance in the technique of Hellenic agriculture cannot, after all, be kept altogether distinct from the malignant effects of Greek and Roman militarism, since the invention of the new agricultural technique in Sicily was connected with the Sicilian War of 480 B.C. and its introduction into Italy with the Italian War of 218–203 B.C. When the Romans finally annihilated Carthage in 146 B.C. they gave away all the libraries of Punic literature which fell into their hands to the local African princelings who had taken sides politically with Rome against Carthage without abandoning their taste for the Punic culture. To the Roman victors, this culture meant nothing; but there was one Carthaginian book of which they made an exception for practical reasons; and this was Mago's treatise on plantation-farming. Though the work ran to twenty-eight volumes, the Roman senate ordered its translation into Latin (Pliny, *Natural History*, xviii. 22).

³ The dispossessed peasantry of Italy tended to drift into Rome; and those who remained in the countryside sank to the status of a rural proletariat, who eked out a miserable existence by serving as casual labourers (*politores*) on the plantations at harvest time and at other busy seasons. For the depopulation of the Campagna by the time of the establishment of the Empire, see the passage from Livy which is quoted in Part II. D (i), vol. ii, on p. 17, footnote 1, above.

Gracchi, and not the private munificence of the soberly public-spirited conservatives who endowed the Italian *Alimenta* in the second century after Christ¹—could avail to rid the Roman World of this social blight which the last advance in agricultural technique had brought upon it. In spite of such efforts at reform, the plantation slave-gang continued to usurp the yeoman farmer's place until the slave-plantation system collapsed spontaneously in consequence of the breakdown of the money economy on which this system of agricultural mass-production for a world-market was dependent for making its profits. This financial breakdown was part of the general social *débâcle* of the third century of the Christian Era; and this *débâcle* was doubtless the outcome, in part, of the agrarian malady which had been eating away the tissues of the Roman body social for the previous four centuries. Thus the social cancer of Roman plantation-slavery eventually extinguished itself by causing the death of the society upon which it had fastened.²

The plantation-slavery of Roman Italy has a modern Western analogy, which has often been pointed out, in the plantation-slavery which was rampant in the cotton-belt of the United States during the first half of the nineteenth century after Christ.³ In this latter case, again, a new virulence was instilled into the ancient social disease of slavery by an improvement in economic technique. If the close of the eighteenth century had not witnessed the outbreak of the Industrial Revolution in the United Kingdom, it is probable that the nineteenth century would have seen slavery die of inanition in the Southern States of the American Union, as it had already died on the northern side of the Mason and Dixon Line. It was the Industrial Revolution that gave slavery in the Southern States a new lease of life by creating a vast new market for raw cotton in Lancashire and by inventing the machinery for carding and spinning and weaving cotton at a financial profit. In these new circumstances, which a sudden great improvement in the Western technique of manufacture had brought about, the Slave Power became a menace not only to the political integrity of the United States, but to the social welfare of the whole Western World. Happily, the Western World has responded more effectively than the Hellenic World ever succeeded in responding to this formidable challenge. We have realized that slavery becomes too terrible an evil to be tolerated when the terrific driving-power of Industrialism has once been applied to it; and, realizing this, we have paid the

¹ For the *Alimenta*, see Hirschfeld, O.: *Die Kaiserlichen Verwaltungsbeamten bis auf Diocletian*, 2nd ed. (Berlin 1905, Weidmann), pp. 212-24.

² For the spiritual reaction of the Roman plantation-slaves to the penalization to which they were subjected, see Part II. D (vi), vol. ii, pp. 213-16, above.

price that has had to be paid—the price of the American Civil War—in order to stamp our modern slavery out. We have still, however, to overcome a host of other social evils which the technical improvements of the Industrial Revolution have brought in their train; and one of these still unconquered evils is the malignant growth of a parasitic urban proletariat: an evil which seems to be sapping the strength of our own society in our time as it once sapped the strength of the Roman body social in its latter days.

The lack of correlation between progress in technique and progress in civilization is apparent in all these cases in which techniques have improved while civilizations have remained stationary or have suffered set-backs. The same thing is apparent in the cases, which we have next to consider, in which techniques have remained stationary while civilizations have been moving either forward or backward.

For example, an immense step forward in human progress was made in Europe between the Lower and the Upper Palaeolithic Age.

‘The Upper Palaeolithic Culture is associated with the end of the fourth glacial epoch. In place of the remains of Neanderthal Man we find the remains of several types, none of which show any affinity to Neanderthal Man. On the contrary, they all approximate more or less closely to Modern Man. At one bound we seem, when looking at the fossil remains from this epoch in Europe, to have passed into the modern period as far as human bodily form is concerned.’¹

This transfiguration of the human type in the middle of the Palaeolithic Age is possibly the most epoch-making event that has ever yet occurred in the course of human history up to date; for at that moment Sub-Man succeeded in turning himself into Man, while Man, in all the time that has elapsed since Sub-Man’s achievement made Man human, has never yet succeeded in attaining the superhuman level which is the goal of our human endeavours.² This comparison gives us the measure of the psychic advance which was achieved when *Homo Neanderthalensis* was transcended and when *Homo Sapiens* emerged. Yet this immense psychic revolution was not accompanied by any corresponding revolution in technique; so that, on the technological classification, the sensitive artists who drew the pictures that we still admire in the Upper Palaeolithic cave-dwellings have to be confounded with ‘the Missing Link’, while in reality—as measured by wisdom and stature alike, and by every trait that is distinctive of Humanity—this *Homo*

¹ Carr-Saunders, A. M.: *The Population Problem* (Oxford 1922, Clarendon Press), pp. 116–17.

² For the rare exceptions that prove this rule, see III. C (ii) (a), below.

Palaeolithicus Superior is divided from *Homo Palaeolithicus Inferior* by just as great a gulf as is our latter-day *Homo Mechanicus*.

This instance in which a technique has remained stationary while a civilization has advanced finds its converse in other cases in which techniques have remained stationary while civilizations have receded.

For example, the technique of iron-working, which had been originally introduced into the Aegean at the moment of the great social relapse when the Minoan Civilization went into dissolution, remained stationary—neither improving nor declining—at the time of the next great social relapse, when the Hellenic Civilization went the way of its Minoan predecessor. Our Western World inherited the technique of iron-working from the Roman World unimpaired; and it likewise inherited the technique of writing, embodied in the Latin Alphabet,¹ as well as the Greek science of mathematics.² Socially, there had been a cataclysm. The Hellenic Civilization had gone to pieces and a social interregnum had ensued, out of which the new Western Civilization eventually emerged. But there was no corresponding break of continuity in the realm of technique—at least, not in the histories of the three important techniques just mentioned.

Another example of a technique remaining stationary while a civilization has receded is noticed by Ibn Khaldūn³ in his contemporary observation of his own ancestral country. He remarks that, in the fragment of the Iberian Peninsula that still remained under the Islamic dispensation in his own day, the ancient arts had survived though the ancient order of society had fallen into a lamentable decay.

Our empirical survey has made it abundantly clear that there is

¹ We might add that the Orthodox Christian World inherited the Greek Alphabet from the Hellenic Civilization, the Islamic World the Arabic Alphabet from the Syriac Civilization, the Far Eastern World the Sinic characters from the Sinic Civilization, and the Babylonian World the Sumerian cuneiform script from the Sumerian Civilization. In bringing up these further examples, however, we might be convicted of arguing in a circle; for, in all these cases, we have left it an open question whether the posterior civilization in each pair of civilizations is really an independent civilization or merely the petrified or mummified corpse of the antecedent civilization. And the continuity of script (with all the continuity of mental tradition which that implies) is of course one of the strong arguments against admitting the claims of these posterior civilizations to be allowed the status of independent civilizations in their own right. (This problem has been discussed in Part I. C (ii), vol. i, on pp. 133-46, above.)

² 'The Mathematics are distinguished by a peculiar privilege that, in the course of ages, they may always advance and can never recede. But the ancient geometry, if I am not misinformed, was resumed by the Italians in the same state in the fifteenth century' (Gibbon, E.: *A History of the Decline and Fall of the Roman Empire*, ch. lii). This is perhaps a reminiscence of a passage in Turgot's *Second Discours sur les Progrès Successifs de l'Esprit Humain* which was delivered at the Sorbonne on the 11th December, 1750 (*Œuvres de Turgot*, Nouvelle Edition (Paris 1844, Guillaumin), 2 vols.), vol. ii, p. 600. The topic also appears in Turgot's *Plan de Deux Discours sur l'Histoire Universelle* (op. cit., p. 666).

³ Ibn Khaldūn: *Muqaddamāt*, translated by de Slane, Baron McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. ii, pp. 360-2.

no correlation between progress in technique and progress in civilization;¹ yet, although the history of technique proves not to be, in itself, the criterion for which we are seeking, it may still provide us with a clue for finding the object of our search.

(c) 'ETHERIALIZATION'

The history of technique, which has not yet revealed to us any law of social progress, does reveal the principle by which technical progress is governed; and this principle may be described as a law of progressive simplification.

For example, in the history of our modern Western system of transportation, the technical advance which was achieved in the substitution of mechanical for muscular traction required, in its first stage, a great elaboration of material apparatus. When the horse was replaced by the locomotive, the simple carriage-road had to be turned into an elaborate 'permanent way', with cuttings and tunnels and embankments and viaducts to eliminate the gradients of the natural landscape, and with a pair of metal rails to smooth the passage of the wheels of the steam-driven train. On the other hand, in the next stage of technical advance, when the ponderous and bulky steam-engine, with its heavy consumption of water and coal, is replaced by the light and handy internal-combustion-engine, driven by a mixture of petrol vapour and air, the improvement in technique is accompanied by a notable simplification of apparatus this time. The technical advantage of mechanical traction is not only preserved but enhanced (inasmuch as the internal-combustion-engine is an improvement on the steam-engine from the mechanical standpoint); and at the same time the disadvantage of the elaborate material apparatus is partly transcended. For the motor-car liberates itself from the rails to which the locomotive is bound, and takes to the road again, with all the speed and power of a railway-train and almost all the freedom of action of a pedestrian or a horse.

The same law of progressive simplification is apparent in the history of our modern Western technique for the instantaneous long-distance conveyance of words. When electric telegraphy and telephony is first invented, the electric currents by which the Morse Code is signalled or the human voice is conveyed have to be transmitted through an artificially installed medium of metal wires. Then comes the invention of wireless telegraphy and telephony—a further technical advance which makes it possible to dispense with the artificial medium of transmission and to radiate the human voice through the natural medium of the 'aether' to the distance of

¹ The same opinion is expressed by Eduard Meyer in his *Geschichte des Altertums*, vol. i (i), 4th ed. (Stuttgart and Berlin, 1921, Cotta), pp. 164-5.

hundreds of miles in as short a time as it takes the human organs of speech to transmit the same voice a few feet through the natural medium of the air.

Or let us consider the history of writing: an older device for transmitting the sense, without the sound, of human speech across vast intervals of Space and Time. In the history of writing, there is not merely a correlation between progress in technique and simplification in form, but the two tendencies are actually identical, since the whole of the technical problem which a script has to solve, in transposing human speech into a visual medium, is the distinct representation of the widest possible range of language with the greatest economy of visual symbols.

Perhaps the most elaborate script that has ever been invented is the Sinic, in which the characters are pictograms which have been conventionalized without being simplified, and in which each pictogram represents, not a sound nor even a word, but an idea. Since there is an infinite diversity of nuance among the ideas that arise in the human mind, the number of characters in the Sinic script runs into five figures, and a single one of these characters may contain more strokes than there are letters in our Alphabet. This Sinic script is certainly the most incompetent in technique, as well as the most elaborate in form, of any system of writing that is now in use.

This still current Sinic script is technically inferior to two extinct scripts—the Egyptiac hieroglyphic and the Sumeric cuneiform—which have each independently taken the step of using conventional pictures to represent sounds as well as ideas, or, in technical terms, to serve as phonograms as well as ideograms. The technical advantage of this step lies precisely in the economy of visual symbols which it renders possible; for while there is no limit to the number of distinct ideas in the human mind which may demand distinct representation in a system of ideograms, there is only a limited range of sounds in any given human language. Accordingly, a script that is based on phonograms instead of ideograms can provide for all its requirements out of a relatively small stock of visual symbols. If the Egyptiac and Sumeric scribes had only had the courage of their invention, and had discarded the use of ideograms altogether when once they had hit upon the use of phonograms to take their place, their scripts might perhaps now be holding the field which our own Alphabet actually occupies at the present day. As it was, they deprived themselves of the advantage of their invention by persisting in the use of phonograms and ideograms side by side (a perverse practice which made the invention of phonograms a source of confusion instead of a step towards

176 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
greater clarity). All the same, both scripts are technically superior to the Sinic in almost all respects. Their pictograms are both fewer in number and simpler in form. The Egyptiac scribes, in particular, carried simplification of form very far in the cursive versions of their script, while, in their analysis of the sounds of human speech, they went the length of making phonograms for syllables containing only one consonant: an advance which brought them to the verge of inventing a consonantal alphabet.

In the historic Alphabet, which was invented by some Syriac scribe after the Egyptiac scribes had just failed to hit upon it, the simplification of writing, which is the same thing as its technical improvement, has been carried almost as far as it can go. The essence of the Alphabet is the analysis of the sounds of human speech into their primary elements, and the representation of each of these elements by a separate visual symbol which combines distinctiveness with simplicity of form. The Phoenician inventors of the Alphabet analysed out, and gave representation to, the consonants. The Greeks borrowed this Phoenician invention and then improved upon it by analysing and representing the vowels as well. And the Latin Alphabet, which is the script of our own Western Society, is simply a variant of the Greek Alphabet without any change, for better or worse, in technical principle. In a vowelised alphabet of the Greek and Latin type, it is possible to give visual representation—with sufficient accuracy and distinctiveness for practical purposes, if not for the scientific requirements of the phonetician—to almost any sound that is used in almost any language that has ever been spoken.

In the history of writing, with its culmination in the Alphabet, the law of correlation between improvement in technique and simplification in apparatus is admirably illustrated. And its operation can be discerned again in the history of language: a technique of articulate and significant sounds which is both logically and chronologically prior to the invention of writing and indeed is perhaps coeval with Humanity itself.

In the history of language, as in the history of writing, simplification is the path of technical progress. The tendency of language, when it is in course of improvement, is to abandon the elaborate apparatus of inflexion, in which the parts of speech that express relations are welded on to the parts that express meanings, and to resort, instead, to the use of prepositions and auxiliary verbs and particles, in which the same relations are expressed in the form of separate words which can be attached to, or detached from, any of the other separate words that express meaning, without the necessity of altering the internal form of either word in either class.

It will be seen that this tendency in the technique of language has the same effect as the tendency in the technique of writing to progress from ideographic pictograms to conventional symbols representing the elementary sounds. The effect in both cases is to render possible an economy of forms: visual forms in the case of writing and sound forms in the case of speech. It will also be seen that the relation-word sits as loosely to the meaning-word as the tool to the human hand, which can pick up or put down any tool at will or exchange one tool for another, while the nexus between the inflexion and the root on to which it is welded is like the nexus between a sword-fish's sword and the sword-fish, in contrast to the casual relation of a man's sword to the man.¹ In an inflective language, the root can no more let go of its inflexion than the sword-fish can let go of his sword; and therefore, if the meaning has to be put into a different relation to other meanings than the particular relation which any one given inflexion happens to express, a separate form has to be coined for the combination of the old root with the new inflexion, with which it has now to enter into another indissoluble partnership, just as, when Nature wishes to use the snout as a prehensile implement instead of using it as a piercing instrument, she cannot just unship the sword-fish's sword and fit a trunk to the creature's snout instead, but can only provide herself with a trunk by creating quite another creature—an elephant—to wear this other implement as an integral part of his elephantine bodily organism.

The tendency of language to simplify itself by abandoning inflexions in favour of auxiliary words may be illustrated by a comparative view of the histories of certain representatives of the Indo-European family of languages. As the two extreme poles in this series we may take Classical Sanskrit and Modern English. Sanskrit happens, by an historical accident, to have been stabilized in a standard literary form before it had deviated very far from the now extinct *Indo-europäische Ursprache*: the primitive mother tongue from which all the members of the Indo-European family are descended. Accordingly we find in Sanskrit what, to an English-speaking student, seems an amazing wealth of inflexions side by side with a surprising poverty in particles, while, at the other end of the scale, Modern English has retained only a few miserable vestiges of the wealth of inflexions bequeathed by the *Ursprache*, but has recouped itself by developing a wealth of prepositions and particles and, above all, auxiliary verbs. In this linguistic gamut in which English and Sanskrit represent the extremes, Attic Greek

¹ For this contrast between animal fixity and human adaptability, see in general Part III. A, pp. 79-88, above.

lies somewhere near the middle. An English student of Attic Greek is struck by its conformity with Sanskrit in having retained an abundance of inflexions; but closer inspection shows that the Greek and the Sanskrit wealth in inflexions is differently distributed between the different parts of speech. Greek is poorer than Sanskrit in the inflexions of the noun, but on the other hand it is richer in the inflexions of the verb; and this difference is significant, because the verb, unlike the noun, has relation as well as meaning in its essence. But a Hindu Sanskrit scholar who turned his attention to Greek would probably not be struck by the Greek inflexions at all—neither by the verbal inflexions nor by the nominal. The feature in the Attic Greek language that would impress the Sanskrit scholar would be its wealth in particles; and on the strength of this feature he might be inclined to think of Attic Greek and Modern English as representing an identic tendency, in common contrast to Sanskrit. If the three languages are to be judged by their relative powers of expression, we shall probably come to the conclusion that our hypothetical Indian has come nearer to hitting the mark in classing Greek with English than our hypothetical Englishman in classing it with Sanskrit. For the English composite verb has at least as wide a range and as subtle a nuance as the Greek inflective verb for expressing relations, while the Sanskrit verb is equally inferior to them both.

Again, the Arabic verb impresses the English student at first sight by its wealth of 'aspects' expressed through internal inflexions; but he soon discovers that the English verb, with the aid of its auxiliaries, can express all the nuances of these 'aspects' as well as all the distinctions of Time, whereas the Arabic verb with its single pair of tenses—a perfect and an imperfect—is virtually incapable of expressing the elementary Time-distinction between past, present, and future.

The Ottoman Turkish language, again, manages to express as wide a range and as subtle a nuance of relations by means of an inflective verb as Attic Greek itself; but its inferiority to Greek is revealed by its poverty in particles. Such particles as it possesses are mostly loans from Persian and Arabic. But the greatest weakness of Turkish is its lack of relative pronouns; and it is in vain that it calls all its gerunds and gerundives into action to do duty for them. The result is a complication of syntax which makes the most ponderous Ciceronian or Miltonian period seem simple by comparison. The Turkish language would be better off if it could drop half its verbal inflexions and acquire a handful of relatives in exchange.

The line of progress in the technical improvement of language

which the foregoing survey reveals seems to suggest that a technically perfect language would dispense with inflexions altogether in favour of auxiliary words, and perhaps eventually dispense with these auxiliaries as well, and express itself entirely in uninflected words of meaning whose relations with one another would be indicated simply by their relative order. Modern English has travelled this path a very long way; and the Classical Chinese language—which seems to have been as progressive as the Classical Chinese script is backward—has possibly travelled the whole path to its logical end.

Our law of correlation between improvement in technique and simplification in apparatus, which we have now illustrated by examples taken from the diverse fields of transportation and telegraphy and telephony and writing and language, can be illustrated equally well from the histories of astronomy or philosophy or fashions in dress.

If we turn the pages of some illustrated history of fashion in our own Western World, we shall be struck by the steadiness of the trend which is apparent, in the course of the last four centuries, from elaborateness towards simplicity and from diversity towards uniformity. In the costume of a Queen Elizabeth or a King Louis XIV there is a profusion and extravagance of ornament, and an exaggeration and distortion of the natural lines of the human figure, which smells strongly of the savage.¹ Elizabeth, with her enormous ruff and her tight-laced waist, has essentially the same conception of finery as the primitive African or Melanesian who files his teeth to a point and distends his lips and ear-lobes by inserting wooden plugs into the living flesh. And Louis, when he caricatures the beauties of the natural human head of hair in the fantastically dense tresses and crimped curls of his enormous bagwig, is really aiming at the same effect as the Abyssinian chieftain who envelops his head in a lion's mane. The excruciating effect which is made upon our modern sensibilities by Louis' and Elizabeth's taste is enhanced when we notice the contrast between the costliness of the dress of the fashionable world in the sixteenth and seventeenth centuries and the scantiness and raggedness of the clothing of the common people, who have to go unshod and unprotected against cold and rain. As we turn over the pages, we are conscious of a growing sense of relief as we approach the fashion-plate of our own 'post-war' generation.² For in our generation the

¹ For an interpretation of the latter-day savage's penchant towards puerility and monstrosity as a kind of pathological 'compensation' for the absence of progress in his social life, see Bergson, Henri: *Les Deux Sources de la Morale et la Religion* (Paris 1932, Alcan), pp. 142-4.

² Peter the Great, whose tastes (both for good and for evil) were some two centuries ahead of his age (even if we reckon his age on the Western and not on the, by then,

old invidious class-distinctions are no longer flaunted so flagrantly in the field of dress: a field in which they have no rhyme or reason, whatever there may be to be said for them or against them in other spheres. In dress, there has been a remarkable and salutary approximation towards uniformity between class and class within living memory; and the main factor in this approximation has not been the cheap imitation of the finery of the rich which has been brought within the means of the poor by the mass-production of the Machine Age. A more striking and significant tendency has been the voluntary simplification in the dress of the minority which disposes of the means to set the fashion. There has been a tendency towards the use of plainer materials, and—even more markedly—towards a simpler cut, which aims at following and setting off the natural lines of the human body instead of contradicting or caricaturing them.¹

It is interesting to rediscover the same trend in the history of Hellenic fashion as in the history of our own. Thucydides, writing on the morrow of the Great War of 431-404 B.C., describes the finery which had been worn by well-to-do male Athenians not so very long before the historian's own day, in contrast to the simple modern style of dress which had been introduced by the Spartans and had spread from Lacedaemon to the rest of Hellas. In the same passage Thucydides also mentions a modern tendency—which unfortunately has no counterpart as yet in our modern Western World—for the well-to-do minority to accept equality with the masses, not only in the matter of dress, but in their whole material standard of living.² This tendency towards simplification which is manifest,

relatively belated Byzantine Time-scale), already experienced this sense of relief in England when he visited that country at the close of the seventeenth century. When King William III asked his eccentric Russian guest: 'What has pleased you most in London?' Peter replied: 'That the richest people go about in clothes that are plain but clean' (Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote), p. 224. Cp. p. 515).

¹ In the modern Western male costume, this tendency set in with the invention of the coat and waistcoat towards the close of the seventeenth century, and was confirmed in the opening decades of the nineteenth century when bright colours and showy materials were abandoned and breeches were superseded by trousers. In the Western female costume, the corresponding revolution has been later but more rapid. While much the same kind of taste is expressed, *mutatis mutandis*, in the feminine as in the masculine dress of our 'post-war' age (in which the two costumes both incline equally towards simplicity, as in the Elizabethan age they both inclined towards a certain style of extravagance), there is a violent contrast between the male and female costume of the mid-nineteenth century, when the Empress Eugénie revives the worst extravagances of Queen Elizabeth, while the Emperor Napoleon III already anticipates the sober and almost sombre garb of a President Mustafâ Kemal or a President Calvin Coolidge.

² 'The Athenians were among the first to lay aside their arms and change to a more comfortable and refined way of living. The older men of the well-to-do class have only recently abandoned the luxuries of wearing linen shirts and fastening their hair in a bunch with gold grasshopper clasps. Among the kindred population of Ionia, these fashions long retained their hold over the older generation. The simple dress which we wear to-day was first introduced by the Lacedaemonians, who reduced the whole outward standard of living to approximately the same level for rich and poor. They were also the first to take exercise naked, and to strip in public and oil themselves for this purpose. Originally, even at the Olympic Games, the athletes used to cover their nakedness with a

for all who have eyes to see, in the histories of fashions in dress, appears to reveal itself to instructed eyes in the progress of Physical Science, and it has also been acclaimed as the royal road of philosophic intuition by one of our greatest living Western philosophers.

In the history of Physical Science, the Ptolemaic system of astronomy, which was the first attempt to give a coherent explanation of all the observed movements of all the known heavenly bodies, had to postulate an elaborate geometrical apparatus of epicycles. The Copernican system, by which the Ptolemaic has latterly been replaced, presents us, in far simpler geometrical terms, with an equally coherent explanation of the vastly wider range of movement of the innumerable host of heaven that has now been revealed by the invention of the telescope. And to-day Einstein's system—for those who comprehend it—appears to be introducing a still further simplification into the hypothetical structure of the physical universe by bringing the dimensions of Time and Space, and the laws of Gravity and Radiation and Magnetism, into a single synthesis.

In the domain of Philosophy, a corresponding tendency towards simplification has been taken as an index of progress in intuition by Monsieur Henri Bergson.

'Something which, when viewed from without, is susceptible of being decomposed into an infinite number of inter-coordinated parts might perhaps appear, if viewed from inside, as one single act. For instance, a movement of the hand, which feels to us indivisible, will be perceived externally as a curve which can be defined by an equation: that is, as a juxtaposition of points which are infinite in number and which at the same time all satisfy a single law. In the place where our analysis, remaining outside its object, discovers positive elements in greater and ever greater numbers and in more and ever more astonishing coordination with one another (in virtue of the very fact that their numbers increase), an intuition which succeeded in planting itself in the interior would be aware no longer of means combined but rather of obstacles surmounted. An invisible hand passing brusquely through a heap of iron filings would be simply brushing aside resistance; but the sheer simplicity of this act would appear, when viewed from the side of resistance, in the guise of a juxtaposition of the filings in a positively determined order.'¹

The simile of the movement of the hand in its outward and its inward aspects is applied by the same philosopher, in another

loin-cloth while competing, and it is not many years since this practice has been given up. Among the non-Hellenic peoples of the present day, especially in Asia, when there are boxing and wrestling competitions, they still wear loin-cloths for the occasion; and it would be possible to point out many other similarities between ancient Hellenic and modern non-Hellenic life.' (Thucydides: 'Prolegomena' (Bk. I, chs. 1-5).)

¹ Bergson, Henri: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 118-19.

182 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
passage of the same work, to the relation between Man and the material universe.

'When one speaks of the smallness of Man and the vastness of the Universe, one is thinking of the complexity of the Universe at least as much as of its dimensions. A personality makes an effect of simplicity, whereas the material world is of a complexity that baffles the imagination: the most minute particle of matter that is visible to the human eye is already a world in itself. How persuade oneself that Personality can be the sole *raison d'être* of Matter? But we will not allow ourselves to be intimidated. When we find ourselves in the presence of parts which can be enumerated *ad infinitum*, it is possible that the whole may be simple, and that we are just looking at it from the wrong end. Carry your hand from one position to another: for you, who perceive the movement from within, it is something that is indivisible. But I perceive it from outside and fix my attention on the line that has been traversed; and so I say to myself that the first half of the space has first had to be traversed, and then half the second half, and then half of what remains, and so on and on: I might continue for milliards of centuries, and still I should never have exhausted the enumeration of the acts into which my eyes decompose the movement that feels indivisible to you. Similarly the gesture which evokes the Human Species—or, in general terms, evokes objects of love for the Creator—might very well demand conditions which demand other conditions which lead on step by step into an infinite regress. The mere thought of this multiplicity turns the thinker giddy; yet it is nothing but the reverse side of an indivisible something. It is true that the infinitely numerous acts into which we decompose a movement of the hand are purely virtual, and that they are absolutely determined in their virtuality by the actuality of the movement itself, whereas the constituent parts of the Universe, and the parts of these parts, are realities—and realities which, when they are living creatures, enjoy a spontaneity which can reach the point of free activity. So we will not claim that the relation of the complex to the simple is precisely the same in the two cases. The purpose of the parallel that we have drawn has merely been to show that sheer complexity—even when it is a boundless complexity—is not a sign of importance; and that an existence which is simple in itself may demand conditions that stretch away in an endless chain.'

Thus a modern Western philosopher applies the historic *solvitur ambulando* to the ancient sophism of the Eleatics in order to equate complexity with Matter and simplicity with Life, and this not merely with Life at its lowest levels, but with the Life of Man and the Life of a Creative Godhead.

The foregoing illustrations seem to indicate that our law of the correlation between simplification in apparatus and improvement in technique has no limits to its field of operation. We have discovered

¹ Bergson, *op. cit.*, pp. 278-9.

this same tendency towards simplification at work in the most diverse spheres. But perhaps 'simplification' is not quite an accurate, or at least not altogether an adequate, term for describing the tendency which we have just been investigating. 'Simplification' is a negative word. It connotes omission and elimination; whereas, in the concrete examples of the phenomenon from which we have inferred the validity of our law, the ultimate effect which the law produces by its operation is not a diminution, but an enhancement, of practical efficiency or of aesthetic satisfaction or of intellectual understanding or of godlike love. In fact, the result is not a loss but a gain; and this gain is the outcome of a process of simplification because this process liberates forces that have been imprisoned in a more material medium and thereby sets them free to work in a more etherial medium with a greater potency. We are witnessing here the release of

'A fiery soul which, working out its way,
Fretted the pigmy-body to decay
And o'er-informed the tenement of clay.'

In other words, the process which we are examining involves not merely a simplification of apparatus but a consequent transfer of energy, or shift of emphasis, from some lower sphere of being or sphere of action to a higher sphere. Perhaps we shall be describing the process in a more illuminating way if we call it, not 'simplification', but 'etherialization'.

This phenomenon of 'etherialization' may be observed in many different spheres.

In the sphere of human control over Physical Nature it may take the form of a transfer of the field of operation from a grosser to a subtler mesh in the texture of the material universe: from coal-fuel to oil-fuel (as in the illustration which we have drawn from the history of our modern Western methods of transportation); or from water-power to steam-power and from steam-power to electric-power; or from the transmission of electric waves through metallic wires to their transmission through the 'aether'. This trend in the development of our modern Western application of Physical Science is indicated, with a finely imaginative touch, in the following passage from the pen of an anthropologist of the present generation:

'We are leaving the ground, we are getting out of touch, our tracks grow fainter. Flint lasts for ever, copper for civilizations, iron for generations, steel for a lifetime. Who will be able to map the route of the London-Peking air express when the age of movement is over or to-day

¹ Dryden: *Absalom and Achitophel*.

184 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
to say what is the path through the "aether" of the messages which are radiated and received? But the frontiers of the petty vanished kingdom of the Iceni still sweep defensively across the southern frontier of East Anglia, from drained marsh to obliterated forest."¹

The consummation towards which this historic tendency may conceivably be advancing (on the assumption that it persists) has been anticipated in imagination by a nineteenth-century English novelist in a phantasia in which he pictures the then prevalent methods of controlling Physical Nature—the methods of the early Industrial Revolution—as having been rendered obsolete by the discovery, and superseded by the application, of an incomparably subtle and powerful physical force.

'I went with my host and his daughter Zee over the great public museum, which occupies a wing in the College of Sages, and in which are hoarded, as curious specimens of the ignorant and blundering experiments of ancient times, many contrivances on which we pride ourselves as recent achievements. In one department, carelessly thrown aside as obsolete lumber, are tubes for destroying life by metallic balls and an inflammable powder, on the principle of our cannons and catapults, and even still more murderous than our latest improvements. My host spoke of these with a smile of contempt, such as an artillery officer might bestow on the bows and arrows of the Chinese. In another department there were models of vehicles and vessels worked by steam, and of a balloon which might have been constructed by Montgolfier. "Such," said Zee, with an air of meditative wisdom—"such were the feeble triflings with Nature of our savage forefathers, ere they had even a glimmering of perception of the properties of Vril."'²

This imaginary 'Vril'-force, with which Bulwer Lytton endows 'the Coming Race', performs the magic which our more sanguine physicists look forward to exercising in our own day if they succeed in discovering a method for 'breaking up the atom'. In both the nineteenth-century and the twentieth-century conceptions, the ultimate form of human control over Physical Nature—the form which is to give Man boundless material power—is conceived as being incomparably etherial in its mode of operation.

The phenomenon of 'etherialization' which thus asserts itself in the domain of Applied Science may also be observed in the domains of Theology and Mathematics and Art and Philosophy.

The etherialization of Theology is compared with the corresponding development in the history of Mathematics by Monsieur Bergson:

'The gradual ascent of Religion towards Gods whose personality is more and more plainly marked and who enter into more and more

¹ Heard, Gerald: *The Ascent of Humanity* (London 1929, Cape), pp. 277-8.

² Bulwer Lytton: *The Coming Race*, ch. xvi.

clearly defined relations with one another or tend to become absorbed into one single divinity . . . has gone forward until a moment has come at which the religious spirit has turned away from the Outward towards the Inward, from the Static to the Dynamic, by a process of conversion analogous to that accomplished by the Pure Intellect when it passed from the consideration of finite magnitudes to that of the Differential Calculus.¹

An etherialization of our modern Western Art which took place in the course of the eighteenth century, when the sceptre passed from the art of Architecture to the art of Music and when the *élan* of the Western artistic impulse was thus, as it were, translated from the grosser medium of stone into the subtler medium of sound, has been traced out by Oswald Spengler in one of the most interesting passages of his *magnum opus*.

'About the year 1740, when Euler was beginning to establish the definitive formulation of Functional Analysis, there arose the Sonata, which is the maturest and the highest form of the instrumental style. . . . Therewith begins the reign of Music over all the other arts. In the field of the plastic arts Music banishes statuary and tolerates nothing but the completely musical and finikinly un-Hellenic and counter-Renaissance *Kleinkunst* of porcelain, which was invented at a time when chamber music was winning its way to a position of decisive importance. Whereas the plastic art of the Gothic age is architectonic ornament—rows of human figures—through and through, the plastic art of the Rococo period is a significant example of an art which is only plastic superficially, while in reality it is under the domination of Music—which is its opposite in the circle of the arts—and is speaking in the language of musical form. This reveals the degree to which it is possible for the technique that governs the foreground of artistic life to be in contradiction with the spirit of the world of forms which this technique creates (*pace* the usual aesthetic theory which assumes that spirit and technique stand to each other in the relation of a cause and an effect). Compare the crouching Venus of Coyzevox (A.D. 1686) in the Louvre with her Hellenic forerunner in the Vatican, and you will see the difference between plastic art treated as music and plastic art working in its own right. In Coyzevox's work, the sense of movement, the flow of the lines, and the fluidity that has been imparted to the very essence of the stone—which, like porcelain, has somehow lost its solidity and mass—can be described most aptly in musical terms: staccato, accelerando, andante, allegro. Hence the feeling that somehow the close-grained marble is here out of place. Hence, too, the altogether un-Hellenic reliance on effects of light and shade: a device which corresponds to what has been the leading principle of oil-painting since Titian. The quality which the Eighteenth Century called colour—whether in an engraving or in a drawing or in a group of statuary—really means music. This quality governs the painting of Watteau and Fragonard and the art of the Gobelins and

¹ Bergson, *op. cit.*, p. 189.

Pastelle. Do we not talk, from that day to this, of "colour-tones" and "tone-colours"? And is this not a recognition of an equivalence finally attained between two arts that are superficially so different? And are not all such designations meaningless in reference to all Hellenic Art? Music even succeeded in recasting, in its own spirit, the Baroque architecture of Bernini. It re-cast it into Rococo; and the transcendental Rococo ornamentation is "played" over by lights which are virtually musical tones, and which perform the function of resolving roofs, walls, arches and everything that is constructive and concrete into polyphony and harmony: an architectural music whose trills, cadences and passaggios carry to the point of identity the assimilation of the architectural semantic of these halls and galleries to the music which was conceived for them. Dresden and Vienna are the homes of this late and shortlived wonderland of chamber music and billowy furniture and mirror-rooms and pastoral poetry and porcelain-groups. This is the last expression of the Western soul: an expression of autumnal ripeness with a touch of autumn sunshine. The Vienna of the Vienna Congress saw it die and disappear.¹

While Spengler's brilliant historical analysis lays bare the process of 'etherialization' in the domain of Art, an illustration of the corresponding process in the domain of Philosophy may be found in a famous passage in which Plato represents Socrates as recounting the history of his own personal intellectual development.

"In my own early days", said Socrates, "I had an extraordinary passion for this branch of study which they call Physical Science. It seemed to me a sublime science to know the causes of all phenomena and to understand the reasons for the genesis and disintegration and existence of each of them. And often I used to rack my brains with such preliminary speculations as whether there is any truth in the theory that living organisms arise out of a kind of fermentation of Heat and Cold; or whether the material instrument of our thought is blood or air or fire; or whether, perhaps, this is a wrong approach to the problem, and we must rather think of the brain as providing the senses of hearing and sight and smell, and think of memory and supposition as arising from the senses, and then think of knowledge as arising at the end of the chain, from memory and supposition when these are brought into a steady focus. And then again I used to speculate on the ways in which all these phenomena pass out of existence, and about the natural history of the stellar universe and of our own planet, until, at the end of it all, I came to the conclusion that I had less gift for conducting this kind of research than any creature in the World. I will give you a conclusive piece of evidence about my state of mind. I was blinded by this kind of research to such an extreme degree that I actually unlearned the things which it had seemed to me—and to others as well—that I had known

¹ Spengler, Oswald: *Der Untergang des Abendlandes*, vol. i (Munich 1920, Beck), pp. 318-20. Compare the passage quoted in III. C (iii), below, on pp. 388-9. The same theme is developed by Heard, G., in *The Ascent of Humanity* (London 1928, Cape), pp. 226-8.

quite clearly before. . . . But one day", he went on, "I happened to hear Anaxagoras giving a recitation from a book in which he said that it is Mind which is the directive force in the Universe and the cause of all phenomena; and here I found at last an explanation that delighted me. It seemed to me somehow right that the cause of all phenomena should be Mind; and I thought that, if this were the truth, a directive force like Mind in the Universe must be directing the whole thing and arranging each detail of it to the best possible purpose." "

In the experience here described, which was evidently a turning-point in Socrates' mental history, the Athenian philosopher transferred his interest and attention from the physical to the psychic sphere, from the Macrocosm to the Microcosm, and discovered in the hypothesis of a spiritual cause that clue to an explanation of the mystery of existence which had eluded him so long as he had been working on the hypothesis that the cause was material. Thus Socrates found intellectual salvation; and, in finding that, he found moral salvation as well; for this change in the field of his research involved a simultaneous change in the goal. In the act of transferring his quest from the physical to the psychic sphere, Socrates transcended Metaphysics and made his entry into the realm of Ethics. As appears in the last sentence in the passage just quoted, the scope of his inquiry now broadened out to include the Good as well as the True; and when the problems of Physical Science had thus ceased to trouble him, he became receptive to the promptings of his *δαμόνιον*.

This *δαμόνιον* that spoke to Socrates after he had grown in wisdom² and had put away childish things³ was no other than the still small voice in which Elijah heard at last the Godhead whom he had not seen in the fire and not encountered in the earthquake and not felt in the great and strong wind which had rent the mountains and broken in pieces the rocks.⁴ And this experience, which came alike to the Syriac prophet and to the Hellenic philosopher, was also attained by the Sinic sage Lao-tse,⁵ when he made the same spiritual transit to the Microcosm from the Macrocosm. This Socratic path led Lao-tse to his intuition of Wu Wei: the ultimate principle whose nature cannot be indicated in the language of the discursive reason except by way of verbal paradox. Wu Wei is that utter emptiness which is the acme of plenitude, and that utter immobility which is the acme of motion, and that utter relaxation which is the acme of intensity, and that utter tranquillity which is the ecstasy of creation.

¹ Plato: *Phaedo*, 96-7.

² 1 Sam. ii. 26, and Luke ii. 52.

³ 1 Cor. xiii. 11.

⁴ 1 Kings xix. 11-12.

⁵ Or (perhaps it is more accurate to say) by the anonymous originators of the school of Sinic philosophy that passes under the name of Lao-tse.

These paradoxical lights on the nature of Wu Wei may perhaps be further illuminated by a parable. For Wu Wei was assuredly the unconscious philosophy of the hero in the story of the Chinese pilot and the English crew: a story which, *se non è vero, è ben trovato*.

Some time about the middle of the nineteenth century, there was an English sailing-ship which used to make the voyage to China, year by year, with the same English crew and used to finish the voyage, each time, by going up the Yangtse, three days' sail up stream, with the same Chinese pilot. Now these were the years when, in England, the Industrial Revolution was making rapid headway; and one year the owners scrapped the old sailing-ship and sent their men out on the China voyage this time in a new-fangled steamer instead. The English crew were as pleased as the English owners with their new mechanical toy; and all the way out they speculated about the impression which the steamer would make upon their old friend the Chinese pilot. To navigate a steamer was quite a sensation even for these seamen from Liverpool, where the wheels had been whirring and the steam had been whizzing all around them since their childhood. How, then, would a steam-propelled vessel strike John Chinaman, when he was suddenly confronted with this miracle of mechanical ingenuity which had no parallel or precedent in his own Chinese social background? Would he react like the Queen of Sheba when she had seen all Solomon's wisdom and there was no more spirit in her? Would wonder or terror be his dominant emotion when he was asked to take the wheel of a ship which, with no visible means of propulsion, was able to travel at a greater velocity than any junk or sampan that had ever been rowed by oars or wafted by sails of bamboo matting? As the Englishmen entertained themselves with these speculations at their Chinese friend's expense on the long voyage out (for the China voyage was still long enough, even when it was made under steam), their curiosity was titivated; and as they approached the point off the China coast where the pilot always came on board they had quite a tense feeling of expectancy. When they saw their old friend mounting the ladder from the pilot-boat, they could hardly restrain themselves from calling his attention to the marvellous difference between the new and the old; but they just managed to hold their tongues, for they had decided beforehand that it would be more amusing to let John Chinaman's comments burst out of his mouth spontaneously.

The pilot stepped on to the steamer's deck, made his customary salutation to the Captain, walked to the wheel, and prepared to steer the vessel when she got under way again. 'Now he will have his surprise', thought the Englishmen, 'when he finds the ship moving forward with not a sail bent on the yards. Now he will

realize that there is something about this ship that he has never come across in any ship before.' But it was the Englishmen's fate to have the surprise on this occasion; for, when the engines started, they were astonished to see that not a muscle moved on the Chinese pilot's face, and that he kept his place at the wheel without uttering a word. 'Well, John Chinaman is a cautious fellow', they said as they talked the pilot's conduct over. 'His mind works slowly. He will ruminate all day and tell us his thoughts this evening.' But the day passed, and the evening, and the night, and the pilot still said nothing, but kept his place at the wheel and quietly did his business as he had always done it before. The second day and night passed likewise, and the pilot had still said nothing when the third and last day arrived—the day on which he was to take his leave after having piloted the steamer up river to her destination. At this point the Englishmen were unable to contain themselves any longer. They forgot their resolution to leave it to the pilot to break the silence first; and they asked him outright what impression their magic ship had made on him. 'Oh! This ship?' said the Chinese (and his face remained as expressionless when he spoke as it had been since he had come on board). 'This ship? Why, once upon a time we used to make ships like this in China too; but we gave them up again some time ago. It must be about two thousand years since we used them last!' And, with his customary salutation the pilot stepped down the ladder into the little boat that was waiting to take him off, and rowed away without so much as one glance back at the masterpiece of Western industry which he had treated so cavalierly. In the game of making an impression, which the English seamen had started in a patronizing vein, the Chinese pilot had won a crushing victory.

The point of this legendary Chinese pilot's retort to the English seamen's curiosity is, of course, not the same as the point of the passage from the pen of an authentic English novelist of the same period which has been quoted above. When the imperturbable Chinese conveyed his contempt for a steamship, or for any other piece of clockwork, by affecting to believe that his own people had invented and discarded that sort of thing a long time ago, he did not mean to say that in China they had replaced steam-power by electric-power and electric-power by 'Vril-power' or by some other imaginary device of incomparable potency for harnessing the material forces of Physical Nature in the service of human purposes. In dismissing his English contemporaries' new mechanical toy as a childish thing—one of 'the feeble triflings with Nature' which his own forefathers had perpetrated and afterwards outgrown—he was making a criticism of the Western Industrial Revolution that cuts

190 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
much deeper than the 'meditative wisdom' of Bulwer Lytton's equally fictitious heroine. He meant to say that his own people had anticipated 'the South Sea Barbarians'—and this perhaps by many centuries—in trying their hand at the exploitation of Physical Nature, but that they had been convinced by their experience that this material world was not the place where human beings should lay up their treasure, and had acted upon this conviction by transferring their interest and energy, not from a less efficient to a more efficient industrial technique, but right away from Industrialism to some wholly different sphere.

This mythical transfer of the treasure of the Sinic Civilization in ancient times has a historic parallel, in the present-day Hindu World, in the preaching of the Mahatma Gandhi to his co-religionists and fellow countrymen. In wrestling with the problem of the penetration of India by the Western system of Industrialism and by the Western spirit with which this system goes hand in hand, the Mahatma has come to the conclusion that India must repudiate not only the present-day apparatus of Western technique, but the whole system and spirit for which this apparatus stands, if she is to find her own salvation. This is the doctrine for which he has found a concrete symbol, understood of the people, in the *khaddar*, or hand-woven cloth of hand-spun home-grown cotton-thread, which he urges all Indian men and women to make for their own wear. The return, which he commends, from the elaborateness of the Western technique of spinning and weaving by power-driven machinery to the simplicity of handwork, is not commended in the belief that there is any intrinsically superior virtue in the simpler, as against the more elaborate, method of providing for one of the primary material necessities of human life. The Mahatma's advocacy of hand-spinning is really an advocacy, in symbolic terms, of a transfer—or reversion—of Indian interest and Indian energy from a material to a spiritual plane of action.

The doctrine and the policy for which the genius of Mr. Gandhi has found this particular form of expression are not, of course, peculiar to this Mahatma of this 'post-war' generation. The spirit of Gandhism is such a strong and persistent and prominent element in the *ethos* of Hinduism that even a Western observer of Hindu life who is so incorrigibly Western-minded as Mr. Rudyard Kipling has seized and expressed this trait in the beautiful story of Purun Dass:¹ the competent, sophisticated, and ostensibly Westernized prime minister of an Indian autonomous state under the British Raj who suddenly renounces his whole worldly position at the height of his worldly success, and deliberately adopts the life of a

¹ 'The Miracle of Purun Baghat', in *The Second Jungle Book*.

hermit. The career of this Hindu hero of a Western work of fiction, which was conceived and written before Mr. Gandhi was heard of, actually foreshadows the historic career of the Gujerati Banya, educated in London and established in business in South Africa, who renounced a successful legal practice in order to follow Religion. The path of Purun Bhagat and of Mahatma Gandhi is a path that is familiar in the history of Hinduism and its antecedents. It is the path which the Emperor Açoka trod in his youth when he renounced the use of war as an instrument of his Imperial policy, and again in middle life when he virtually renounced the Imperial throne itself in order to lead the life of a Buddhist monk. And the same path had been trodden by the Emperor's master the prince Gautama, when he renounced throne and wife and child in order to become the Buddha.

Thus the way of life which is being preached in our generation by the Hindu Mahatma Gandhi has a host of precedents and inspirations in the Hindu tradition. Yet, since the Mahatma himself has freely acknowledged his spiritual indebtedness to Christianity as well as to Hinduism, we may perhaps conjecture that his preaching reflects in part the influence of a passage in the New Testament in which the principle of 'etherialization' has received its supreme expression.

'Take no thought for your life, what ye shall eat or what ye shall drink; nor yet for your body, what ye shall put on. Is not the life more than meat, and the body than raiment?

'Behold the fowls of the air: for they sow not, neither do they reap nor gather into barns; yet your heavenly father feedeth them. Are ye not much more than they? . . .

'And why take ye thought for raiment? Consider the lilies of the field, how they grow; they toil not, neither do they spin:

'And yet I say unto you that even Solomon in all his glory was not arrayed like one of these. . . .

'Therefore take no thought, saying, What shall we eat? or, What shall we drink? or, Wherewithal shall we be clothed? (For after all these things do the Gentiles seek). . . .

'But seek ye first the Kingdom of God, and His righteousness.'¹

This passage from the Gospel according to Saint Matthew may conclude our chain of quotations to illustrate the wide range and extreme diversity of the spheres in which the phenomenon of 'etherialization' manifests itself. In each sphere, the same fundamental tendency can be discerned under some different aspect. In morphological terms, 'etherialization' appears as a progressive change in organization from complexity towards simplicity; in

¹ Matt. vi. 25-6, 28-9, and 31-3.

192 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
 biological terms, it appears as a *saltus Naturae*¹ from Inanimate Matter to Life; in philosophical terms, as a re-orientation of the mind's eye from the Macrocosm towards the Microcosm; in religious terms, as a conversion of the soul from the World, the Flesh, and the Devil to the Kingdom of Heaven. If we chose to extend our survey further, no doubt we should find different manifestations of 'etherialization' in other spheres again; but the illustrations which we have gathered in already are sufficient for our purpose; for they point the way unmistakably towards the object of our present inquiry.

(d) THE TRANSFERENCE OF THE FIELD OF ACTION

Etherialization has come to our notice as a concomitant of growth; and our illustrations of the phenomenon make it clear that the criterion of growth, for which we are in search, and which we have failed to discover in the progressive and cumulative conquest of the external environment, either human or physical, lies rather in a progressive change of emphasis and transfer of energy and shifting of the scene of action out of this field into another field in which—as we have noted already in passing²—the action of Challenge-and-Response may find an alternative arena. In this other field, challenges do not impinge from outside but arise from within, and victorious responses to challenges do not take the form of surmounting an external obstacle or overcoming an external adversary but manifest themselves, instead, in an inward self-articulation or self-determination. When we watch an individual human being or a human society making successive responses to a succession of challenges, and when we ask ourselves the question whether this particular series of responses to challenges is to be interpreted as a manifestation of growth, we shall arrive at the answer to our question through observing whether, as the series proceeds, the action does or does not tend to shift from the first to the second of the two fields aforesaid. The presence or absence of this tendency gives us our criterion for the presence or absence of growth; and we may add that it is always a tendency that is in question; for, if we look narrowly, we shall find it impossible to cite a case of Challenge-and-Response in which the entire action takes place on either the one or the other of our two fields exclusively. Even in those responses which look like sheer conquests of an external environment at first sight, an element of inward self-determination can always be detected as well and, conversely, there is always some

¹ Pace the dictum that *Natura non facit saltum*: a view which cannot be reconciled with our present insight into the inwardness of natural phenomena.

² See III. B, p. 126, and III. C (i) (a), p. 128, above.

residue of action in the external area, even when the shifting of the scene of action to the internal arena has been carried as far as it will go. The action is never fought solely on one single field in any of those successive bouts of Challenge-and-Response in which the victorious responses accumulate into growths. At the same time, if growth is being achieved, this implies that, in each successive bout, the action on the external field is counting for less, and the action on the internal field for more, in deciding the issue between victory and defeat.

This truth comes out very clearly in those presentations of history in which the attempt is made to describe processes of growth exclusively in terms of the external field from start to finish. Let us take as examples two outstanding presentations in these terms which are each the work of a man of genius: Monsieur Edmond Demolins' *Comment la Route Crée le Type Social*,¹ and *The Outline of History* which has been written by Mr. H. G. Wells.²

The environmentalist thesis is set out by Monsieur Demolins in his preface³ with uncompromising terseness:

'Il existe à la surface du globe terrestre une infinie variété de populations; quelle est la cause qui a créé cette variété? . . . La cause première et décisive de la diversité des races, c'est la route que les peuples ont suivie. C'est la route qui crée la race et qui crée le type social.'

When this provocative manifesto fulfils its purpose by stimulating us to read the substance of the book in which the author's thesis is worked out, we find that he manages quite well so long as he is drawing his illustrations from the life of societies which have remained on the primitive level. In such cases, the state of society can be explained with approximate accuracy and completeness in terms of responses to challenges from the external environment exclusively; but this, of course, is not an explanation of growth, since these primitive societies are now static. Monsieur Demolins is equally successful in explaining the state of the arrested civilizations. He has done a brilliant piece of work in his chapter on the Eurasian Nomads. But conditions are static here again; and this chapter, which comes first in the book, is also an acme, with all the rest of the book for its anti-climax. When the author applies his formula to patriarchal village communities, the reader begins to be uneasy. The explanation seems too plausible, the course too much plain sailing. In the chapters on Carthage and Venice, one feels sure that he has left something out, without being able quite to say

¹ Demolins, E.: *Comment la Route Crée le Type Social*. (Paris, no date, Firmin-Didot, 2 vols.)

² Wells, H. G.: *The Outline of History* (London 1920, Cassell).

³ Demolins, op. cit., vol. i, p. vii.

what this omission may be. When he seeks to explain the Pythagorean philosophy in terms of a portage-trade across the Toe of Italy, one feels tempted to smile, but checks oneself in deference to Monsieur Demolins' impressive ability and disarming enthusiasm. But the chapter entitled 'La Route des Plateaux—Les Types Albanais et Hellène' pulls one up short. Albanian Barbarism and Hellenic Civilization to be unhesitatingly bracketed together, just because their respective exponents happen to have arrived once upon a time at their respective geographical destinations by way of the same *terrain*! And the great human adventure and human experience which we know as Hellenism to be reduced to a kind of epiphenomenal by-product of the Balkan plateaux! In this unlucky chapter, the argument of *Comment la Route Crée le Type Social* confutes itself by a palpable *reductio ad absurdum*. When a civilization goes so far in its growth as the Hellenic Civilization went before it suffered breakdown, an attempt to describe its growth exclusively in terms of responses to challenges from the external environment becomes positively ridiculous.

Mr. Wells, again, seems to lose his sureness of touch when he handles something mature instead of handling something primitive. He is in his element when he is exercising his imaginative powers in order to reconstruct some dramatic episode in some remote æon of Geological Time. His story of how 'these little theriomorphs, these ancestral mammals', survived when the overgrown reptiles went under is almost worthy to rank with the Biblical saga of David and Goliath, and in its own vein it is inimitable. As we read the passage,¹ we look forward eagerly to coming chapters, in which this brilliant mind is to play upon the famous events of human history; but we are destined to experience a certain disappointment. When the little theriomorphs turn into Palaeolithic Hunters or Eurasian Nomads, Mr. Wells, like Monsieur Demolins, still comes up to our expectations; and he does passably well when some individual theriomorph, here and there, develops the personality of a Ts'in She Hwangti, or even the personality of a Nabonidus. But he comes to grief in the recent annals of our own Western history when he has to size up that singularly etherialized theriomorph William Ewart Gladstone. In appreciating—or failing to appreciate—Mr. Gladstone, Mr. Wells has allowed his judgement to be perverted by conscious prejudice and—still graver intellectual crime—by involuntary obtuseness. No doubt, in Mr. Wells's own mind, his passing references to Mr. Gladstone, whether felicitous or not, are only a niggling detail in the great sweep of his historical panorama; and yet, in a sense, they are a touchstone for trying the quality of the

¹ Wells, *op. cit.*, pp. 22-4. The passage is quoted textually in IV. C (iii) (c) 2 (γ), vol. iv. pp. 426-7, below.

whole monumental work. For, in handling Mr. Gladstone, Mr. Wells is handling a great man of his own culture and his own country and his own century; and, to an author with Mr. Wells's imaginative gift, such a subject offers an opportunity of apprehending human character, not by a mere description and classification and docketing of the outer man, but by an intuitive sympathy of one soul with another. Mr. Wells has failed to rise to the occasion here because he has failed to transfer his spiritual treasure, as his narrative proceeds, from the Macrocosm to the Microcosm; and this failure reveals the limitations of the magnificent intellectual achievement which *The Outline of History* represents.¹

Mr. Wells's failure may be measured by Shakespeare's success in solving the same problem. If we arrange the outstanding characters of the great Shakespearian gallery in an ascending order of etherialization, and if we bear in mind the fact that the playwright's technique is to reveal characters by displaying personalities in action, we shall observe that, as Shakespeare moves upward from the lower to the higher levels in our character-scale, he constantly shifts the field of action in which he makes the hero of each drama play his part, and shifts it always in the same direction—giving the Microcosm an ever larger share of the stage and pushing the Macrocosm ever farther into the background. We can verify this fact if we follow our series of Shakespearian heroes from Henry V through Macbeth to Hamlet. The relatively primitive character of Henry V is revealed almost entirely in his responses to challenges from the human environment around him: in his relations with his boon-companions and his relations with his father and in his communication of his own high courage to his comrades-in-arms on the morning of Agincourt, and in his impetuous wooing of Queen Kate. When we pass to Macbeth, we find the scene of action shifting; for Macbeth's relations with Malcolm or Macduff, and even his relations with Lady Macbeth, are equalled in importance, in the action of the play, by the hero's own relations with himself. Finally, when we come to Shakespeare's revelation of Hamlet, we see him allowing the Macrocosm almost to fade away, until the hero's relations with his father's murderers, and with his spent flame Ophelia, and with his outgrown mentor Horatio, become absorbed into the internal conflict which is working itself out in the hero's own soul. In Hamlet, the field of action has been transferred from the Macrocosm to the Microcosm almost completely; and in this masterpiece of Shakespeare's art, as in Aeschylus's Prometheus or in Browning's *Dramatic*

¹ This criticism of *The Outline of History* is made with all respect, in the belief that frankness in criticism is the best evidence of sincerity in appreciation. For a positive appreciation of Mr. Wells's achievement as an historian, see Part I. A, vol. i, pp. 4-5, above.

Monologues, a single actor virtually monopolizes the outward stage, in order to leave the greater scope for action to the surging spiritual forces which this one personality holds within him.

This transference of the field of action, which we discern in Shakespeare's presentation of his heroes when we arrange these fictitious personalities in an ascending order of spiritual growth, can also be discerned in the histories of civilizations. Here too, when a series of responses to challenges accumulates into a growth, we shall find, as this growth proceeds, that the field of action is shifting, all the time, from the external environment of the growing society into the interior of the society's own body social.

For example, we have noticed above, in another connexion, that, when our Western forefathers in France and England succeeded in repelling the onslaught which the Scandinavians made upon Western Christendom in the earliest age of our Western history, one of the means by which they achieved this signal victory over their human environment was by forging the potent military and social instrument of the Feudal System.¹ The creation of the Feudal System was of the essence of the Western response to the Scandinavian challenge; and we may now go on to observe that Feudalism was also the element in this response that caused its momentary equilibrium to overbalance and thus opened the way for the Promethean *élan* of our Western life to pass the dead point that is reached whenever a challenge is successfully met, and to make the transit from one dynamic bout of Challenge-and-Response to another. The social and economic and political differentiation between different classes of society, which Feudalism entailed, set up certain stresses and strains in the structure of the Western Society; and these strains produced the next challenge with which the growing society was confronted. Western Christendom had hardly rested from its labours in beating back the Vikings before it found its next task in the problem of replacing the Feudal System of relations between classes by a new system of relations between sovereign states and their individual citizens.² In this example of two successive challenges in the history of our Western Civilization, the shift of the scene of action from the exterior to the interior field is plainly apparent.

We can observe the same tendency in other passages of history which we have likewise examined already in different contexts.

In Hellenic history, for example,³ we have seen that the earlier challenges in the series of challenges and responses of which Hel-

¹ See Part II. D (v), vol. ii, pp. 199-200, above, with the quotations there given from Paul Vinogradoff's *English Society in the Eleventh Century* (Oxford 1908, Clarendon Press). See further *op. cit.*, pp. 88-9.

² For the role of this challenge in Western history, see further III. C(ii)(b), p. 343, below.

³ See Part III. B, pp. 120-2, and the present chapter, section (a), pp. 139-40, above.

lenic history consists all emanated from the external environment. The earliest challenge of all was the human challenge of the highlanders to the lowlanders in Hellas itself. The victorious lowlanders were then exposed to the physical challenge of the Malthusian problem; and they met it by an expansion overseas which exposed them to a new human challenge from the rival Phoenician and Etruscan colonists of the Western Mediterranean and from the indigenous barbarians. This challenge was actually presented when the expansion of the Greeks was checked for some two centuries (*circa* 525-325 B.C.) by the counter-pressure of their non-Greek neighbours¹—a counter-pressure which became so strong that Hellas was thrown on to the defensive and was compelled, in the critical year 480 B.C., to fight for her existence on two fronts simultaneously: against the Carthaginians in Sicily and against Xerxes in Continental European Greece itself. Thereafter, this formidable challenge from the human environment was triumphantly surmounted in the course of the four centuries beginning with Alexander's passage of the Hellespont. Alexander overthrew the Achaemenian Empire, and thereby opened the way for Hellenism to dominate the main body of the Syriac World, and the Egyptian and Babylonian and Indic worlds into the bargain. The Romans overthrew the Carthaginian Empire and gained the upper hand over the European barbarians—thus opening the way for a fresh expansion of Hellenism towards the west on a scale commensurate with the eastward expansion that had been inaugurated by Alexander. Thanks to these triumphs of Macedonian and Roman arms, the Hellenic Society now enjoyed a respite of some five or six centuries—from the latter part of the fourth century B.C. to the early decades of the third century of the Christian Era—during which no serious challenge from the external environment was presented to it. During those centuries, the Hellenic Society was dominant over all other societies—civilizations and barbarisms alike—that came within its range, and dominant over Physical Nature likewise. It was not until the third century of the Christian Era that the external environment obtruded itself upon the Hellenic World once again by presenting simultaneously the economic challenge of diminishing returns from the social institution of the city-state² and a military challenge from the Sasanian Power on the Euphrates and from barbarian war-bands on other frontiers of the Roman Empire. During the five or six preceding centuries, the Hellenic World was practically exempt from challenges emanating from the external environment, either physical

² See Rostovtzeff, M.: *The Social and Economic History of the Roman Empire* (Oxford 1926, Clarendon Press), *passim*.

198 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
or human, for the first time in Hellenic history. But this did not mean that, during those centuries, the Hellenic Society was exempt from challenges altogether. On the contrary, as we have noted already, these centuries were a period of decline: that is to say, a period in which Hellenism was being confronted by challenges to which it was failing to respond with success. We have seen what these challenges were; and, if we now look into them again, we shall observe that they were all of them new versions of old challenges which had been met victoriously in the external field but had been translated, in that very act, from the environment of the Hellenic Society into the society's own internal life.

For example, the external challenge of Achaemenian and Carthaginian military pressure had stimulated the Hellenic Society in self-defence to forge two potent social and military instruments—the Athenian Navy and the Syracusan Tyrannis—and these two instruments had performed their immediate function by giving Hellas the strength to fling back her external assailants. But the same instruments also produced certain stresses and strains in the internal structure of the Hellenic body social—a competition for hegemony between Athens and Sparta, a degeneration of the Athenians' hegemony over their maritime allies into a tyranny, and a reaction against Syracuse on the part of both her Sicilian barbarian subjects and her Sicilian Greek allies—and these new internal stresses and strains presented the Hellenic Society with a fresh challenge which it failed to meet: a failure which resulted in social breakdown. Thus a challenge which had originally presented itself, in 480 B.C., as an impact of external political forces reappeared in 431 B.C. as a conflict of political forces which were all internal to the Hellenic body social.

In the next chapter of Hellenic history, corresponding effects followed from the expansion of Hellenism, east and west, in the tracks of the Macedonian and the Roman armies. The military victories of Hellenic arms, which exempted Hellenism from any further external challenges for some five or six hundred years, could only achieve this result by transferring the field of Challenge-and-Response from outside to inside the ambit of the Hellenic World. The long military struggles of Hellenism with its external enemies—the Achaemenidae and the Carthaginians and the Barbarians—were brought to a victorious close by Alexander and the Scipios, only to be translated forthwith into the civil wars of rival Macedonian diadochi and rival Roman dictators. The economic competition between the Hellenic and Syriac societies for the mastery of the Western Mediterranean reappeared within the bosom of the Hellenic Society, after the Syriac competitor had succumbed, in the still more devastating domestic warfare between the gangs of

Oriental plantation-slaves and their Siceliot or Roman masters—a warfare which was carried on in the former arena of the Carthagino-Syracusan and Carthagino-Roman Wars.¹ The cultural conflict between Hellenism and the Oriental civilizations—Syriac and Egyptian and Babylonian and Indic—likewise reappeared within the bosom of the Hellenic Society, after the Hellenic culture had successfully asserted its supremacy over the others, as an internal crisis in Hellenic, or Hellenized, souls: the crisis that declared itself in the emergence of Isis-worship and Astrology and the Mahayana and Mithraism and Christianity and a host of other syncretistic religions.

They cease not fighting, East and West,
On the marches of my breast.²

In our own Western history, so far as it has gone up to date, we can detect a corresponding trend. In earlier ages, the most conspicuous of the challenges with which Western Christendom had to contend were presented by the human environment. In its infancy, Western Christendom had to hold its own against the Arab empire-builders of a new Syriac universal state in the Iberian Peninsula and against the abortive Far Western Christian and Scandinavian civilizations along its Atlantic seaboard and against the Continental European barbarians. In the age of the Crusades, when the Western Christians expanded temporarily over the Mediterranean and permanently over the Baltic, they were expanding at the expense of other societies: the Muslims and the Orthodox Christians and the surviving Continental European barbarians. Thereafter, their expansion was temporarily checked by the successful resistance of their victims, and they were subjected in their turn to counter-pressure from formidable alien powers: on one front from the Muscovites and on others from the 'Osmanlis. And after that, again, the West broke out into its latter-day expansion: a movement which is comparable, scale for scale, with the feats performed in Hellenic history by the Macedonians and the Romans, and which has brought the West into collision with the whole of the non-Western World.

Our modern Western expansion has been literally world-wide; and for the time being, at any rate, it has relieved us completely from our old pre-occupation with challenges from alien human societies. The last challenge of the kind in our modern history was presented some two-and-a-half centuries ago, when the 'Osmanlis

¹ For this Hellenic plantation-slavery, see Part II. D (vi), vol. ii, pp. 213-16, and the present chapter, section (b), pp. 169-71, above.

² Housman, A. E.: *A Shropshire Lad*, xxviii. The lines are equally applicable to the religious war in France which was waged in the sixteenth century between Catholicism and Protestantism and which reappeared in the seventeenth century—within the bosom of a victorious Catholic Church which had driven the Huguenots off the field—as the controversy between the Jesuits and the Jansenists.

200 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS made their second attempt to capture Vienna; and, since the failure of that last great Ottoman offensive in A.D. 1683, *Homo Occidentalis* has forgotten how it feels to face a serious menace from an external human force. Since that day he has constantly inspired this feeling in others, without ever again experiencing it himself, until, in these latter days, he has attained a position of world-wide dominance which is absolute on the economic plane and preponderant on the political plane, while even on the cultural plane it is at any rate unrivalled.

The only semblance of an effective external challenge which has been presented to *Homo Occidentalis* since the 'Osmanlis raised their siege of Vienna in 1683 has been the challenge of Bolshevism, which has confronted the Western World since Lenin and his companions made themselves masters of the *ci-devant* Russian Empire in the second Russian revolution of 1917. Yet Bolshevism, for all its breathings of fire and slaughter, has not yet seriously threatened the ascendancy of our Western Civilization, as we know it, outside the frontiers of the U.S.S.R.; and even if one day the Communist dispensation were to fulfil the Russian Communists' hopes by spreading from Russia over the whole face of the planet, a world-wide triumph of Communism over Capitalism would not mean the overthrow of the present world-wide supremacy of the Western Civilization by an alien culture, since Communism, unlike Islam, is itself derived from a Western source. In its origin, the Communist doctrine is a nineteenth-century Western criticism of the nineteenth-century Western social order; and the adoption of this exotic Western doctrine as the revolutionary creed of twentieth-century Russia, so far from signifying that the ascendancy of Western culture is in jeopardy, really shows how potent this ascendancy has come to be.¹

There is a profound ambiguity in the nature of Bolshevism which is manifested in Lenin's career. Did Lenin come to fulfil or to destroy the work of Peter the Great? And does the substitution of Lenin's for Peter's name in the translation of Petersburg into Lenin-grad signify that Lenin has made or marred the fortune of the city which Peter founded? In re-transferring the capital of Russia from an eccentric position on the western threshold of the country to a

¹ The truth that the Russians could not succeed in establishing an ascendancy over the Western World except in so far as they had previously succeeded in Westernizing their own way of life, was already apparent to Gibbon, as may be seen from a passage in the 'General Observations on the Fall of the Roman Empire in the West' at the end of chapter xxxviii of *The History of the Decline and Fall of the Roman Empire*:

'Europe is secure from any future irruption of barbarians; since, before they can conquer, they must cease to be barbarous. Their gradual advances in the science of war would always be accompanied, as we may learn from the example of Russia, with a proportionable improvement in the arts of peace and civil policy; and they themselves must deserve a place among the polished nations whom they subdue.'

central position in the interior,¹ Lenin seems to be proclaiming himself the successor of the Arch-Priest Avvakum² and the Old Believers and the Slavophiles. Here, we feel, is a prophet of Holy Russia who has been great enough to gather up into his own career and personality the whole reaction of the Russian soul against the Western Civilization—a reaction which had been gathering momentum during the two centuries that had passed since the ordeal of Westernization was first forced upon Russia by Peter. And yet, when Lenin casts about for a creed to express this spiritual revolt, he does not find an anti-Western creed of Russian origin. There is a significant touch of irony in the fact that he is constrained to arm Russia for her fight against the West with a borrowed Western weapon, and to take his indictment of the Western Civilization at second-hand from a Western critic: the German Jew Karl Marx.

It is true that the Marxian creed comes nearer to a total repudiation of the Western order of society than any other creed of Western origin which a twentieth-century Russian prophet could have adopted. And this explains the paradox that a Utopia which was conceived in a Western environment, as a protest against the industrialization of Western life, should have been erected for the first time into an officially established social régime in a non-Western country in which the process of Westernization had hardly gone skin-deep, and in which the solvent of Industrialism had not yet begun to disintegrate the primitive agrarian economy which was the traditional economic basis of the Russian Society. It was the negative and not the positive element in the Marxian creed—its denials and not its affirmations—that made it congenial to a Russian revolutionary mind; and this explains why in Russia, in 1917, the exotic Western apparatus of capitalism was successfully overthrown by the equally exotic Western doctrine of Communism. This explanation is borne out by the metamorphosis which the Marxian philosophy appears to be undergoing in the Russian atmosphere. For in Russia, since 1917, we seem to see Marxism turning, before our eyes, into an emotional and intellectual substitute for Orthodox Christianity, with Marx for its Moses and Lenin for its Messiah and their collected works for the Scriptures of this new atheistic Russian Church Militant. In this apparent metamorphosis of Marxism, it looks, at first glance, as though, in Russia, the spirit of the intrusive Western Civilization had been overcome at last, and the indigenous spirit of the Orthodox Christian Civilization had reasserted itself. But the phenomena take on a different aspect when we turn our

¹ For this oscillation of the capital of modern Russia between Moscow and Petersburg, see Part II. D (v), vol. ii, pp. 157-8, above, and Part IX, below.

² See *The Life of the Archpriest Avvakum, by himself*, translated by J. E. Harrison and Hope Mirrlees (London 1924, Woolf).

202 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
attention from faith to works, and examine what Lenin and his successors have actually been doing to the Russian people.

When we ask ourselves what is the significance of the Five Years' Plan, we are constrained to answer that, whether the Plan be destined, in the long run, to succeed or to fail, there can be no mistake about its intention. This is an attempt to mechanize agriculture as well as industry and transportation, to change a nation of peasants into a nation of mechanics, to transform the old Russia into a new America. In other words, it is a latter-day attempt at Westernization which is so ambitious and so radical and so ruthless that it puts Peter the Great's work into the shade. If Peter could have had foreknowledge of this Bolshevik Five Years' Plan, he would have gasped. 'I only chastised these miserable Russians with whips', he would have exclaimed, 'but my audacious successors are chastising them with scorpions! I only scratched the surface of Russian life, but these giants, with their mighty engines, are ploughing up the Russian soil and pulling up the tree of indigenous Russian culture by the roots!' Thus, willy-nilly, the prophet Lenin and his successors are playing Balaam's and not Jonah's part. They are working—and this with demoniac energy—to ensure the triumph in Russia of the very civilization which they are denouncing in the World at large. No doubt they dream of creating a new society which will be American in equipment but Russian in soul. Yet this is a strange dream to be dreamed by statesmen for whom a materialistic and deterministic interpretation of History is an article of faith! On Marxian principles, we must expect that, if a Russian peasant is taught to do the work and live the life of an American mechanic, the peasant will also learn to think as the mechanic thinks and to feel as he feels and to desire what he desires. And in this tug-of-war which we are witnessing in Russia between the ideals of Lenin and the methods of Ford we may look forward to seeing the modern ascendancy of the Western over the Russian Civilization paradoxically confirmed.

The ambiguity in Lenin's career, which we have just analysed, is likewise apparent in the career of the Russian prophet's Hindu contemporary and compeer Gandhi, whose involuntary furtherance of the same ubiquitous process of Westernization is still more ironical. The Hindu prophet sets out to sever the threads of cotton which have entangled India in the activities of the Western World. 'Spin and weave our Indian cotton', he preaches, 'with your Indian hands. Do not any longer clothe yourselves in the products of Western power-looms; and do not, I conjure you, seek to drive those alien products out of the Indian market by setting up on Indian soil new Indian power-looms on the Western pattern!' This

message, which is Gandhi's real message,¹ is not accepted by Gandhi's countrymen. They revere the spirit of the saint, but they only follow his guidance in so far as he resigns himself to leading them along the path of Westernization. And thus we see Gandhi to-day promoting a political movement with a Western programme—the transformation of India into a sovereign independent parliamentary state—and with a Western procedure (the whole Western political apparatus of conferences, resolutions, votes, platforms, newspapers, and publicity). In this political campaign, the prophet's most effective—though not his most obtrusive—supporters are those very Indian industrialists who have done the most to defeat the prophet's real mission—the men who have acclimatized the technique of Western industrialism in India itself. Their factory chimneys, which the prophet, in his heart of hearts, must regard with dismay, rise almost within view of his retreat at Sabarmati.² Stranger still, Western thoughts colour and inform the prophet's own mind. He seeks inspiration in Western works of philosophy and devotion at least as much as in the Hindu Scriptures³.

In this spiritual travail of a Gandhi and a Lenin in our generation, we can watch the impact of the Western Civilization upon Hinduism and upon Russian Orthodox Christendom in the act of transformation from an external encounter between the Western Society and its neighbours into an inner experience of a Westernized World. Strive as they will to win a decisive victory for an anti-Western reaction, the Hindu and the Russian zealot of these latter days can only succeed in giving an impetus to the very process of Westernization against which they are up in arms. The life and energy with which they inspire their anti-Western 'holy wars' is actually drawn—and this is the secret of its vigour—from a Western source; and thus, in the crucible of these ardent souls, an anti-Western movement is transmuted into a new manifestation of the spiritual force against which it is directed. A Gandhi and a Lenin find it impossible to take spiritual action without being moved by the spirit of the Western Civilization; and, conversely, the Western-born heirs of this Western Civilization find it impossible to be indifferent to the thoughts and feelings and acts of a Gandhi and a Lenin. We are aware that, in the titanic careers of these two Janus-faced figures, our own Western destinies are involved, as they were never involved in the careers of a Sivaji or an Ivan the Terrible or a

³ For the Christian element in the Mahatma Gandhi's inspiration, see p. 191, above.

Saladin or a Suleymān or any other champion of an alien civilization who has taken up the challenge of our Western power without being touched, in his own soul, by the influence of the Western spirit. It is as though this Western spirit were a kind of psychic electricity which had now electrified the whole of Mankind with such effect that there could no longer be any exertion of human psychic force which was not either a positive or a negative charge of this all-pervasive Western current.

This change which is signalized in the careers of Gandhi and Lenin is not confined to the relations of the West with the two once alien societies that have now given those two great personalities to a Westernized World. The transformation of an external conflict between two separate societies into an internal conflict in the bosom of one of the two, when this one has succeeded in absorbing the other into its own body social, is a phenomenon which might be illustrated alternatively from the history of the relations between the modern West and any of the other societies with which the West has come into contact in the course of its world-wide expansion in these latter days. In fact, the virtual elimination of external challenges emanating from the human environment, which has been one of the remarkable features of our Western history during the last two hundred and fifty years, has been followed by the presentation of equivalent challenges in the internal life of a Western Society which has expanded into an oecumenical system. On the economic plane, one of these transmuted challenges is the new problem arising from the differences in standards of living which continue to divide different fractions of Mankind after they have been brought into economic relations with one another by the world-wide nexus of our modern Western commerce and industry and finance. On the political plane, the challenge of 'holy wars' waged by alien civilizations against Western Christendom has been transmuted, since the triumph of the West over these external adversaries, into a Western problem of 'imperialism' and 'colonial administration'. On the cultural plane, the conflict between Western culture and alien cultures has been transmuted into a conflict, within the bosom of a Western-made 'Great Society', between different classes and different races.

Corresponding transmutations of external into internal challenges have followed the triumph of the Western Civilization over its material environment—a victory which it has won with its left hand while its right hand has been occupied in mastering its human neighbours. In this material sphere, the process of transference comes out very clearly in the recent economic history of Great Britain: the country in which the modern Western Industrialism

first emerged a century-and-a-half ago in order to spread thereafter far and wide over the World, as molten lava flows abroad over the landscape from the crater through which it has welled up out of the depths of the Earth.

In England, the first round of the stubborn contest between Man and Physical Nature out of which the new force of Industrialism arose was fought under the same conditions as the first bout in the mythical wrestling-match at Peniel between Jacob and the angel,¹ when Jacob's superhuman adversary immobilized the human combatant by putting out of joint the hollow of his thigh. On the eve of the triumph of Man over Physical Nature which inaugurated the Industrial Revolution, the pioneers of Industrialism in England found themselves caught and held by the geographical location of the raw materials and the potential sources of mechanical power which they were striving to make subject to their own human wills. The potters were constrained to establish their potteries where they happened to find the beds of potter's clay, and the iron smelters their furnaces at some half-way house between the deposits of the ore from which their metal was to be extracted and the seams of the coal by which the operation was to be performed. Even the textile manufacturers were constrained to aline their mills along the foot of the Pennines, in order to tap the streams descending from the fells for water-power to drive their machinery.² At this stage, Physical Nature was able to dictate to Man the place where he should try conclusions with her; and the industrial map of England was governed by the geological and physiographical map *a priori*.

In the next stage, Man triumphed over Nature as Jacob overcame the angel at the breaking of the day, when he refused to let him go unless he would give him his blessing. In this second round of the contest, the fathers of Industrialism solved the problem of transportation and thereby liberated their industrial operations from their previous bondage to the vagaries of Geology and Physiography.

'Where does that there clay come from?' asked Edwin. For not merely was he honestly struck by a sudden new curiosity, but it was meet for him to behave like a man now, and to ask manly questions.

'Runcorn,' said 'the Sunday' scornfully. 'Can't you see it painted all over the boat?'

'Why do they bring clay all the way from Runcorn?'

'They don't bring it from Runcorn. They bring it from Cornwall. It comes round by sea—see?' He laughed.

'Who told you?' Edwin roughly demanded.

¹ Genesis xxxiii. 24-32.

² For the original location of the industrial districts in England, see Part II. D (ii), vol. ii, pp. 60-4, above.

'Anybody knows that!' said 'the Sunday' grandly, but always maintaining his gay smile.

'Seems devilish funny to me,' Edwin murmured, after reflection, 'that they should bring clay all that round-about way just to make crocks of it here. Why should they choose just *this* place to make crocks in? I always understood . . .'

'Oh! Come on!' 'the Sunday' cut him short. 'It's blessed well one o'clock and after!' . . .

'The Sunday' was satisfied with his bit of accidental knowledge. Edwin was not. Edwin wanted to know why, if the clay for making earthenware was not got in the Five Towns, the Five Towns had become the great seat of the manufacture. Why were not pots made in the South, where the clay came from?¹

We know, of course, the answer to this question which an English novelist, born and bred in the Staffordshire potteries in the latter part of the nineteenth century, has placed in the mouth of one of his characters whom he presents to his readers as his own fellow-townsmen and contemporary. Long before the end of the nineteenth century, the invention of the steamship and the railroad had made it possible for the potter to fetch his clay, and the iron-master his ore, and the textile-manufacturer his raw wool and cotton, not only from the other end of England but from the very ends of the Earth, and to carry the stuff so cheaply that the cost of transportation did not wipe out or even perceptibly diminish the manufacturer's profits. And why—as Edwin Clayhanger went on to ask—did Muhammad prefer to perform the *tour de force* of making the mountain come to him instead of taking the line of lesser resistance and migrating, himself, to the mountain? 'Why were not pots made in the South, where the clay came from?' Why had the Five Towns in Staffordshire not only become, but remained, the great seat of manufacture? The answer was that, in the course of a century, as industrial technique had gone from strength to strength, the relative importance of the two fundamental factors in industry had gradually shifted. In the eighteenth century, the dominant factor in pot-making had been the clay, which dictated to the potter the place where he should set up shop. A century later, the dominion had passed from Physical Nature to Man, until the site of the Potteries had come to be determined no longer by the location of the raw material, but rather by the local presence or absence of the human skill that fashioned the clay into pots. In the geographical nexus between the clay and the potter, the original relations were thus actually inverted. In the eighteenth century, the potter had gone to Staffordshire to find his clay; in the nineteenth

¹ Arnold Bennett: *Clayhanger*, Bk. I, chs. (i) and (ii).

century, when the Staffordshire clay-beds had become utterly inadequate to supply the needs of an industry which had increased the scale of its operations in the meantime by a hundred or a thousand fold, the clay was coming to Staffordshire from Cornwall to find its potter. And thus the Five Towns remained the great seat of the manufacture for a different reason from that which had caused them to become the seat of the manufacture originally. In the beginning, the lode-stone had been the clay; in the next chapter of the story, the magnetic power had come to be transferred from the inanimate clay to the human skill which the clay had originally attracted to itself.

If we now turn our attention from the industry of clay to the industries of metal and of fibre, a further chapter in the history of Industrialism unfolds itself. For when once human skill has established its ascendancy over raw materials and over mechanical driving force as the dominant factor in industrial production, it is only a matter of time for the volatile human spirit to break loose from its obsolete material moorings and to blow where it lists.

In the metal industry in England, this tendency has been perceptible since the close of the General War of 1914-18, as the corollary of a technical change: the transfer of plant and capital from the production of the old-fashioned staple heavy-work to that of newfangled implements—such as motor-cars—in which the sheer bulk of mineral consumed in the productive process counts for very much less in proportion to the amount of the human skill which is brought into play. In 1931, it was remarked by a sharp-sighted French observer of English social life that

'One can already perceive a spontaneous movement of population from the north of England towards the south, from the mining areas towards London and the Thames Valley. This tentative migration may be considered as the first visible after-effect of the attack on the coal monopoly. In the nineteenth century the centre of gravity of the British economic structure was irresistibly attracted towards the coal basins of the north; the twentieth century may produce a new equilibrium, less strictly dependent on the Black Country.'

In the cotton industry—which operates with a raw material that is vastly lighter than that employed in even the most finikin lines of our 'post-war' metallurgy—the liberation of human skill from the bondage of gross matter has become virtually complete. In this industry, the skill once mobilized by water-power in Lancashire and New England has been able to attract to itself, from the ends of the Earth, a raw material which cannot be produced at all by the local soil and climate of New England or Lancashire themselves;

¹ Siegfried, A.: *England's Crisis* (London 1931, Cape), pp. 125-6.

and, in the next chapter of this story, the diffusion of the skill which used to be concentrated in the classic seats of the industry has been equally wide in its range. At the present time, the raw cotton is produced in almost every part of the tropical and sub-tropical belt in which the soil and water required for cotton cultivation can be found; and at the same time the World's cotton-crop is spun into cotton-thread and woven into cotton cloth in mills that are no longer confined to the purlieus of Manchester or Lowell, but have sprung up like mushrooms—east and west and north and south—round Kobe and Shanghai and Ahmadabad and on the Polish plains and on the piedmont of North Carolina.

In this thoroughgoing diffusion of the cotton industry, we have a classic instance of a challenge from the Physical Environment being met and mastered triumphantly by *Homo Faber*. And the result which has been attained in textiles to-day (and this in every stage of the economic process, from the production of the raw material to the marketing of the finished product) seems likely to be attained in other industries to-morrow. In fact, we may look forward to a time when Industry of all kinds will have shaken itself free from the ties of locality and will have solved the technical problem of performing its operations at any point on the surface of the Earth at which it may elect to instal itself. But the plight of the cotton industry in the very hour of its technical victory plainly shows that the old contest between Man and Physical Nature has not really been transcended, but has rather been transmuted into a new conflict between Man and Man.

The pioneers of the cotton industry wrestled with, and eventually triumphed over, the technical difficulties of cultivating the cotton plant, and of transporting the cotton crop from field to mill, and of carding and spinning and weaving the cotton fibre by mechanical power; but these very triumphs in the technical sphere have created new problems in the realm of human relations. The extension of the area of cotton-cultivation has produced a competition between the cotton-growers of America and Asia and Africa to supply the mills; the diffusion of the technique of cotton-manufacture has produced another competition between the manufacturers of Great Britain and New England and North Carolina and Japan and China and India and Poland to supply the world-market; and, over and above these local rivalries, a conflict of interests has arisen between Capital and Labour, and between Producers and Consumers. These human problems have been bequeathed to the latter-day heirs of the cotton industry by their predecessors, from whose victories over Physical Nature they have also inherited the solutions of those technical problems which used to obsess the industry in its infancy.

In this history of our modern Western cotton industry we can detect, once again, as we follow out a sequence of challenges and responses, the tendency for the scene of action to shift from the external environment to the internal life of the society or the individual that is the subject of the experience.

The self-same tendency appears in the history of the technique of communications, which has latterly played so important a role in our modern Western industrial development.

The invention of sailing-ships overcomes the barrier of the estranging sea; the invention of twin-screw steamships liberates the navigator from his bondage to the winds, even as an auxiliary or emergency source of driving-power. Again, the invention of the wheel enables Man to transport overland a load of greater bulk and weight than the maximum that he is capable of carrying on his own shoulders, while the invention of railways enables him to increase the load almost *ad infinitum* and to whirl it across the breadth of a continent almost as easily as a ship could waft it across the breadth of an ocean. Tunnels pierce the barriers interposed by mountains; six-wheeled motor-cars and caterpillar-tractors skim over quaking bogs and yielding sands; and finally aeroplanes make transportation wholly independent of sea and land and mountain and swamp and desert and all the other physical obstacles by which the movement of goods and persons was impeded so long as it was tied down to the aquatic and terrestrial surface of the globe. More wonderful still, we have now discovered means of communication between human intelligences which render the transportation of human bodies superfluous. For the arts of writing and telegraphy and telephony and television, and the organization of the newspaper press and the broadcasting radio, have lengthened the range of the human eye and ear and voice from a few miles or a few yards to the great circle of the Earth's circumference. The age-long human ambition to 'annihilate distance' has been realized at last in our day; but here again, in the act of overcoming a challenge presented by the external environment, we have evoked a new challenge in the internal field of our own social life. We have 'annihilated distance' by equipping our physical movements and our physical senses with a vastly enhanced material 'drive'; and this technical triumph—which has been achieved substantially within the last hundred and fifty years—has given 'the traffic problem' a wholly new meaning.

Let us call up in our minds the now fast-fading picture of the pre-mechanical road. This antique road is thronged with all kinds of primitive wheeled vehicles: wheel-barrows, and rickshaws, and ox-carts, and dog-carts, with the stage-coach as the *chef-d'œuvre* of muscular traction, and with a foot-propelled bicycle here and there

as a portent of things to come. Since this road is already rather crowded, there are a certain number of collisions; but nobody minds, because nobody is hurt and the traffic is scarcely interrupted. For the fact is that these collisions are not serious. They cannot be serious, because the traffic is so slow, and the muscle-power—human, bovine, equine—by which the vehicles are propelled is so feeble, that these vehicles can collide and rebound without mishap. 'The traffic problem' on this road is not the problem of avoiding collisions, but the problem of hauling the loads and covering the distances. Accordingly, there is no sort of traffic-regulation: no policeman on point duty, and no system of signal-lights.

And now let us turn our eyes to the familiar road of to-day on which a mechanized traffic hums and roars. On this road, the problems of speed and of haulage have been solved, as is testified by this motor-lorry with its train of trucks that comes lumbering along with the momentum of a charging elephant, and by this sports-car that goes whizzing past with the swiftness of a bee or a bullet. But, by the same token, the problem of collisions has become 'the traffic problem' *par excellence*. For while the chauffeur commands a traction-power which puts the teamster out of the running so long as the chauffeur is competent and sober, a fool or a knave at the driving-wheel of a motor-vehicle is far more dangerous both to the public and to himself than a fool or a knave on the driver's seat of a hay-wagon. Hence, on this latter-day road, the crucial challenge is no longer technological but psychological. Instead of being concerned to transport larger and heavier loads at higher speeds, we are rather concerned nowadays to avoid collisions by regulating the traffic: by introducing a lighting-system, by teaching the drivers what the signals mean, and by having the road patrolled by police in order to see that these signals are obeyed. The old challenge of physical distance has been transmuted into a new challenge of human relations between drivers who have learned how to 'annihilate distance' and have thereby put themselves in constant danger of annihilating one another.

This change in the nature of the traffic problem on our roads has, of course, a symbolic as well as a literal significance. It typifies the general change that has occurred over the whole range of our modern Western social life since the emergence of the two dominant social forces of the age: the economic force of Industrialism and the political force of Democracy.¹ Owing to the extraordinary progress which our latter-day inventors have made in harnessing the energies of Physical Nature and in organizing the concerted action of millions

¹ For the rise of these two forces to their present position of supremacy, see Part I. A, *init.*

of human beings, everything that is now done, for good or evil, in our society is inevitably done with a stupendous 'drive'; and this has made the material consequences of individual acts far greater and the moral responsibility of the agents far heavier than these used to be under our previous social régime.¹ It may be that in every age of every society some moral issue is always the challenge that is fateful for the society's future; but, however that may be, there is no doubt, in the case in point, that it is a moral challenge and no longer a technical challenge that confronts our own society in our own day.

'In the present-day thinker's attitude towards what is called mechanical progress, we are conscious of a changed spirit. Admiration is tempered by criticism; complacency has given way to doubt; doubt is passing into alarm. There is a sense of perplexity and frustration, as in one who has gone a long way and finds he has taken the wrong turning. To go back is impossible: how shall he proceed? Where will he find himself if he follows this path or that? An old exponent of applied mechanics may be forgiven if he expresses something of the disillusion with which, now standing aside, he watches the sweeping pageant of discovery and invention in which he used to take unbounded delight. It is impossible not to ask: Whither does this tremendous procession tend? What, after all, is its goal? What its probable influence upon the future of the Human Race?

'The pageant itself is a modern affair. A century ago it had barely taken form, and had acquired none of the momentum which rather awes us to-day. The Industrial Revolution, as everybody knows, was of British origin; for a time our island remained the Factory of the World. But soon, as was inevitable, the change of habit spread; and now every country, even China, is become more or less mechanized. The cornucopia of the engineer has been shaken over all the Earth, scattering everywhere an endowment of previously unpossessed and unimagined capacities and powers.

'Beyond question many of these gifts are benefits to Man, making Life fuller, wider, healthier, richer in comforts and interests, and in such happiness as material things can promote. But we are acutely aware that the engineer's gifts have been and may be grievously abused. In some there is potential tragedy as well as present burden. Man was ethically unprepared for so great a bounty. In the slow evolution of morals he is still unfit for the tremendous responsibility it entails. The command of Nature has been put into his hands before he knows how to command himself.'

These moving words propound a question which has been struggling to find expression in all our hearts; and they are words spoken with authority, for they were uttered by the President of

¹ On this point see Toynbee, A. J.: *Survey of International Affairs: 1928* (London 1929, Milford), pp. 7-8.

the British Association for the Advancement of Science in his opening address at the hundred-and-first annual meeting of that historic body.¹ Is the new social driving-power of Industrialism and Democracy to be employed in the great constructive task of organizing a Westernized World into an oecumenical society in which the new forces may find free play to work on a world-wide scale for the benefit of all Mankind? Or are we going to turn our new power to our own destruction by putting its unprecedentedly powerful 'drive' into a number of ancient anti-social institutions—into War and Tribalism and Slavery and Property—at the risk of turning these once not wholly lethal vehicles of evil into veritable Juggernaut cars? This is the latter-day traffic-problem of our Western Civilization in its inward spiritual essence.²

The foregoing analysis of the latest chapter in our Western history incidentally throws light on a phenomenon in Egyptian history which we have already noted for a fact without having hit upon the explanation: the ambiguous significance of the Pyramids as monuments of the breakdown as well as the triumph of the Egyptian Civilization.³ This ironic ambiguity is due, as we can perceive now by analogy, to a shift which occurred, in the Pyramid-Builders' age, in both the theatre and the nature of the challenge in which the Egyptian Society's destiny was at stake.

When we inquired into the genesis of the Egyptian Civilization,⁴ we found that it had been brought to birth by the audacity and

¹ The full text of Sir Alfred Ewing's address on this occasion, which was delivered in York on the 31st August, 1932, will be found in *The Times* of the 1st September, 1932.

² The same simile of the traffic on the road has been drawn, with the same application, by Professor Gilbert Murray in a speech delivered in 1932 at the Annual General Meeting of the English National Federation of Women's Institutes:

'This is a time of rapid change. The ends of the Earth are being brought closer together. News travels all round the World in a few moments. People travel ever so much more and ever so much faster than they did in our grandmothers' time. The consequence is that all the civilized nations are crowded close together and constantly treading on each other's toes and, as always happens in a crowd, everyone has to be careful and considerate or else there will be trouble.

'Think of any of our big towns—Manchester, Liverpool, Glasgow, or London itself: think of the great stretches of country round them which used to be open fields or moors and which are now streets full of traffic. They used to be open fields and moors. Our fathers and grandfathers could gallop over those moors on horseback, could tear about wherever they liked, without any danger of running into other people or knocking them down. They need hardly ever think of anyone but themselves. The horse only went about twelve miles an hour and there was plenty of room in every direction. But now those moors have become crowded streets. People are driving about them in motors which go at thirty or forty miles an hour and there is no spare room at all. They have to be very careful indeed and always thinking about other people. They have to have red signs and green signs and policemen at point duty to direct them. They have to be very obedient. And even so they kill some four thousand people a year!

'That is exactly the change that has taken place in the World. The World has become crowded: people are moving about faster and faster and the engines that carry them are terribly powerful. There are all sorts of disastrous accidents waiting for us, unless we move with great care and particularly care for others. And when I say care for others I mean people other than ourselves, classes other than our own class and nations other than our own nation.'

³ See the present chapter, section (a), p. 153, above, as well as I. C (ii), vol. i, pp. 141-3.

⁴ See II. C (ii) (b) 2, vol. i, pp. 302-15, above.

determination of pioneers who had met the challenge of desiccation on the Afrasian Steppe by plunging into the forbidding and apparently impenetrable jungle-swamp of the Lower Nile Valley and turning the formless wilderness into a pattern of ditches and embankments and fruitful fields. This heroic victory of human wills over the wantonness of Physical Nature demanded not only a sustained individual courage, but also a continuous co-operative effort; such co-operation demanded discipline; and the discipline through which the fathers of the Egyptian Civilization won the day in their battle with the jungle-swamp was purchased at the price of subordinating the wills of the rank and file to the wills of a few outstanding leaders. Thus the physical ordeal out of which the Egyptian Civilization emerged, like the human ordeal which Western Christendom underwent in the Scandinavian onslaught, left a mark on the internal articulation of the growing society in addition to the change which it produced in the society's relations with its external environment.¹ By the time when this Egyptian ordeal came to an end, the water and soil and vegetation of the Lower Nile Valley were subject to the wills of human beings; and at the same time the great majority of these human victors, in the very act of subduing Physical Nature, had themselves fallen into subjection to a small minority of their own human kind who happened to be endowed with exceptional power of command or with exceptional intellectual ability.

This differentiation in authority and knowledge and wealth and prestige between the ruling minority and the subject majority in the Egyptian Society of 'the Old Kingdom' went to far greater lengths than the corresponding differentiation between the social positions of different classes in medieval Western Christendom under the feudal régime. The command which the King of the Two Lands, and his hierarchy of administrators and technicians and priests, had acquired over the wills and imaginations and actions and lives of the Egyptian peasantry was indeed as absolute as the control which he had established, through this command of 'man-power', over the soil and water of the Land of Egypt itself. In other words, the challenge originally presented to Man in the encounter between Man and Nature in the Lower Nile Valley had been transmuted into a challenge which found its arena—and demanded its response—in the internal articulation of the new-born Egyptian Society.

The destinies of the Egyptian Civilization now turned upon the

¹ For the internal effect of the Western Christian response to the Scandinavian challenge upon the structure of the Western Christian Society, see II. D (v), vol. ii, pp. 199-200, and the present chapter, p. 196, above.

question of how the royal lord and master of Egypt and the Egyptians would use his enormous power. Would he respond to this new challenge, which was a moral challenge, in the spirit of Prometheus or in the spirit of Zeus?¹ Would he employ the material power and the 'man-power' at his command in order to improve the lot of the peasantry who had made him master of the material wealth of Egypt when they had placed at his disposal their own human wills? Would he lead them onward and upward to the level of the well-being that had been attained already by the King himself and by his handful of peers? Or would the dizzy height of his pinnacle upset the King of Egypt's moral and intellectual balance? As he surveyed his Land of Egypt and saw that it was very good, would he yield to the illusion that he, and he only, was its creator? Would he forget that, without the disciplined co-operation of a docile peasantry, the King alone could have created nothing? And would he treat the wealth and power which was the co-operative product of an entire society as though it were his private property, to be devoted to his own gratification and glorification in this life and to his immortalization in the life to come? Would he act like Zeus, whose plan of empire, when first he mounted on his father's throne, was to call the Gods—his superhuman companions in arms in his victorious struggle with the Titans—and to give each one of these elect his place and honours, but to have no care of unhappy Man?²

Under the first and the second of the dynasties that ruled the Egyptiac World after the union of the two crowns, this fateful question remained open; but under Snefru, the last king of the Third Dynasty, and his successors of the Fourth Dynasty, it received its answer; and in this answer it was the voice of Zeus and not the voice of Prometheus that made itself heard; for those kings were the Pyramid-Builders;³ and the pyramids have immortalized these autocrats, not as ever-living gods, but as never-to-be-forgotten grinders of the faces of the poor. In the long run, the Egyptian peasantry has had its revenge upon King Cheops and King Chephren; for it handed down their evil reputation through the centuries, until these Egyptiac folk-tales found their way at last into Hellenic literature in the immortal work of Herodotus. In our own age, when the society that produced the Pyramids has long been extinct, their indestructible piles commemorate still the endurance of the peasants who built them and the tyranny of the sovereigns who caused them to be set up.

¹ For the myth of Prometheus and an essay in the interpretation of it, see Part III. B, above.

² Aeschylus: *Prometheus Vincit*, ll. 230-4, quoted above in Part III. B, on pp. 114-15.

³ The builders of the three classic Pyramids at Gizah were King Khufu (Cheops), King Khafre (Chephren), and King Menkaure (Mycerinus).

The spirit that inspired—or, rather, exacted—the building of the Pyramids possessed the Egyptiac Society ever after, and this with fatal consequences. For the power and knowledge which the creation of Egypt out of the wilderness had placed in a minority's hands could only have fructified if its benefits had been shared by this minority with the majority in the next chapter of Egyptiac history. When this new challenge evoked the response of Zeus, and not the response of Prometheus, from the epigoni of the pioneers, the penalty was paid in the first instance by the mass of the people, and in consequence by the society as a whole, and therefore ultimately also by the ruling minority itself. The building of the Pyramids seems to have broken the spirit of the Egyptian peasantry; and the cruel experience of that generation left its impress upon the *éthos* of their descendants, as though the weight of the piles which the fathers had been compelled to raise were weighing, *in saecula saeculorum*, upon the children's souls.¹ This peasantry degenerated into a sullen agrarian proletariat; and the ruling element in the Egyptiac Society degenerated, on its side, into a 'dominant minority' which ruled by repression because it had lost the art of ruling by leadership.² In losing the art of leadership, the Egyptiac 'Heirs of the Kingdom'³ lost, into the bargain, their initiative and their originality in all their activities. The *éthos* of the Egyptiac Society during its long-drawn-out decline displays a rigidity and a conventionality and a barrenness of all inspiration⁴ which present the sharpest contrast to the creative energy displayed in this self-same society's epic birth and growth.⁵

In Egyptiac history, Death laid his icy hand on the life of a growing civilization at the moment when the challenge that was the stimulus of its growth was transferred from the external to the internal field, because, in this new situation, the shepherds of the people betrayed their trust. In the somewhat similar situation of our world in our day, when the challenge of Industrialism is being transferred from the sphere of technique to the sphere of morals, the outcome is still unknown, since our reaction to the new situation is still undecided. On the other hand, in that earlier chapter

¹ For the religious consequences of the tyrannical egotism of the Pyramid-Builders, see I. C (ii), vol. i, pp. 142-3, above.

For the sharpness of this schism in the life of the Egyptiac Society, see Meyer, E.: *Geschichte des Altertums*, 3rd ed., vol. i, part (ii) (Stuttgart and Berlin 1913, Cotta), p. 68.

³ James ii. 5.
⁴ For the role of Ikhnaton, as one of those exceptions which prove a rule, see I. C (ii), vol. i, pp. 145-6, above.

⁵ The vices of the Egyptiac *éthos* during the long ages of decline are so conspicuous that they are often mistakenly attributed to the Egyptiac *éthos tel quel*—a mistake which ignores the almost antithetical virtues which are equally conspicuous during the relatively short age of this society's genesis and growth.

in our history when the challenge of the Scandinavian onslaught upon Western Christendom was met by the creation of a new Western military technique, with a consequent modification of the Western social system, there was a transfer of the challenge which manifestly stimulated the challenged civilization to achieve a further degree of growth. In this instance, as we have seen,¹ the challenge was transferred from the battle-field between Western Christendom and the Vikings to the field of conflict between the different classes into which the Western body social had been impelled to articulate itself in the process of resisting the Scandinavian pressure; and in this new situation our Western Civilization responded as successfully to the challenge of an internal problem as it had previously responded to an external attack, with the result that it continued to grow in wisdom and stature and went forward from strength to strength.

On this showing, we may perhaps persist in the view that a given series of successful responses to successive challenges is to be interpreted as a manifestation of growth if, as the series proceeds, the action tends to shift from the field of the external environment—whether physical or human—to the *for intérieur* of the growing personality or the growing civilization. In so far as this grows and continues to grow, it has to reckon less and less with challenges delivered by alien adversaries and demanding responses on an outer battle-field, and more and more with challenges that are presented by itself to itself in an inner arena. Growth means that the growing personality or civilization tends to become its own environment and its own challenger and its own field of action. In other words, the criterion of growth is progress towards self-determination; and progress towards self-determination is a prosaic formula for describing the miracle by which Life enters into its Kingdom.

This miracle is described by the Hellenic mythology in the parable of Pygmalion's statue, and portrayed by our Western art in Watts's picture of Chaos. In the Hellenic myth, a piece of marble turns to human flesh and blood in response to the prayer of a sculptor who has fallen in love with the creature of his own creative hands. In Watts's *Chaos*, huge figures of titans are pictured in the act of shaking themselves free from the frame of their Mother Earth. They are still clay of her clay—glowing-red forms of one earthy substance and one fiery heat with the glowing-red landscape. Some of them are drowsily stirring in a flux of volcanic flames; others, wholly liberated and fully come alive, are leaning, stupefied, upon the Earth-Mother's breast. But we know that in a moment—the moment after this which the artist has caught in his vision—these

¹ See II. D (v), vol. ii, pp. 199–200, and the present chapter, p. 196, above.

giants will surely rise to their feet and then stride forward over land and sea. We know it because already, on the peaks of the mountains, the grim chthonic glow is turning miraculously into the ethereal flush of dawn; and because, down here in the shadow, unhurried but unhindered, there floats or dances through Space and Time a living chain of Goddesses, hand linked in hand: the endless procession of the Hours.

II. AN ANALYSIS OF GROWTH

(a) THE RELATION BETWEEN GROWING CIVILIZATIONS AND INDIVIDUALS

The argument of the preceding chapter has led us to the conclusion that the criterion of growth is to be found in progress towards self-determination. If this conclusion is right, it may offer us a clue for analysing the process of the growths of civilizations, which is the next problem that lies before us.

If self-determination is the criterion of growth, and if self-determination means self-articulation, we shall be analysing the process by which growing civilizations actually grow if we investigate the way in which they progressively articulate themselves. In a general way, it is evident that a society in process of civilization articulates itself through the individual human beings who 'belong' to the society, or to whom the society 'belongs'. We can express the relation between Society and Individual indifferently by either of these two mutually inverse formulae; and this ambiguity seems to show that either formula is inadequate and that, before setting out on our new inquiry, we shall have to consider what is the relation in which societies and individuals stand to one another.

This is, of course, one of the stock questions of sociology, and there are two stock answers to it. One answer is that the individual human being is a reality which is capable of existing, and of being apprehended, by itself, while the society is nothing but a sum or aggregate of atomic and autonomous individuals who bring societies into existence by coming together and dissolve them by parting company again. The other stock answer is just the opposite. According to this second view, the reality is the society and not the individual: the society is a perfect and intelligible whole, while the individual is simply a part of this whole, who can neither exist nor be conceived as existing in any other capacity or in any other setting. If we examine each of these two antithetical views in turn, we shall find that neither of them will bear examination; and we may also find incidentally what the true answer to our question is.

The classic picture of an imaginary atomic individual is the

218 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
celebrated Homeric description of the Cyclops Polyphemus and his kind, which is quoted by Plato in his *Laws*:¹

Mootless are they and lawless. On the peaks
Of mountains high they dwell, in hollow caves,
Where each his own law deals to wife and child
In sovereign disregard of all his peers.²

It is perhaps significant that, in this fantasy of Hellenic mythology, the atomic way of life is ascribed to no race of ordinary human beings, but to fabulous monsters who are represented as living at the ends of the Earth. The truth is that no human beings have ever actually lived in this mythical Cyclops-fashion; for Man, as we have seen already, is essentially a social animal, in the sense that social life is a condition which the evolution of Man out of Sub-Man pre-supposes, and without which that evolution could not conceivably have taken place.³

'The purely individualist Self or mere individual is a figment of abstraction. For the Self only comes to realization and consciousness of itself, not alone and in individual isolation and separateness, but in Society, among other selves with whom it interacts in social intercourse. I would never come to know myself and be conscious of my separate individual identity were it not that I become aware of others like me: consciousness of other selves is necessary for consciousness of self or self-consciousness. The individual has therefore a social origin in experience. Nay, more, it is through the use of the purely social instrument of language⁴ that I rise above the mere immediacy of experience and immersion in the current of my experience. Language gives names to the items of my experience, and thus through language they are first isolated and abstracted from the continuous body of my experience. Through the naming power of language, again, several items of experience can be grouped together under one name, which becomes distinctive of their general resemblances, in disregard of their minor differences. In other words, the power of forming general concepts becomes possible only through the social instrument of language. Thus the entire developed apparatus of thought with which I measure the Universe and garner an untold wealth of personal experience is not my individual equipment and possession, but a socially developed instrument which I share with the rest of my fellows. The individual Self or Personality rests not on its individual foundations but on the whole Universe.'⁵

¹ *Odyssey*, ix, ll. 112-15, quoted in Plato, *Laws*, Bk. II, 640 B.

² Τοῖσιν δ' οὐτ' ἀγοραὶ βουλευφόροι οὔτε θέμις, ἀλλ' οἷγ' ὑψηλῶν ὀρέων ναῖουσι κάρηνα ἐν σπέσσι γλαφυροῖσι, θεμιστεύει δὲ ἕκαστος παίδων ἢ δ' ἀλόχων, οὐδ' ἀλλήλων ἀλέγουσι.

³ See I. C (iii) (c), vol. i, pp. 173-4, above, and the passages there quoted from Aristotle and from Eduard Meyer.

⁴ For the social origin of language, see the passage quoted from Eduard Meyer in vol. i, p. 174, above.—A. J. T.

⁵ Smuts, J. C.: *Holism and Evolution*, 2nd ed. (London 1927, Macmillan), pp. 253-4. See also Webb, C. C. J.: 'Our Knowledge of One Another,' in *The Proceedings of the British Academy*, vol. xvi (London 1930, Milford), especially pp. 8-9.

So much for the imaginary Cyclopean human being who is pictured as being free to live and die unto himself or alternatively to enter into a 'social contract' with others of his kind, according as he chooses. The human social animal's relation to his society is evidently not that of an arithmetical integer to an arithmetical sum; and we have next to ask ourselves whether the truth is to be found in the antithetical view. Is the individual's relation to his society the relation of a part to a whole?

'There are communities, such as those of bees and ants, where, though no continuity of substance exists between the members, yet all work for the whole and not for themselves and each is doomed to death if separated from the society of the rest.

'There are colonies, such as those of corals or of Hydroid polyps, where a number of animals, each of which by itself would unhesitatingly be called an individual, are found to be organically connected, so that the living substance of one is continuous with that of all the rest. Sometimes these apparent individuals differ among themselves and their energies are directed not to their own particular needs but to the good of the colony as a whole. Which is the individual now?

'Histology then takes up the tale and shows that the majority of animals, including Man, our primal type of individuality, are built up of a number of units, the so-called cells. Some of these have considerable independence; and it soon is forced upon us that they stand in much the same general relation to the whole man as do the individuals of a colony of coral polyps, or better of Siphonophora, to the whole colony. This conclusion becomes strengthened when we find that there exist a great number of free-living animals, the Protozoa, including all the simplest forms known, which correspond in all essentials, save their separate and independent existence, with the units building up the body of Man: both, in fact, are cells; but while the one seems to have an obvious individuality, what are we to say of the other? . . .

'In a sense . . . the whole organic world constitutes a single great individual, vague and badly co-ordinated, it is true, but none the less a continuing whole with interdependent parts: if some accident were to remove all the green plants, or all the bacteria, the rest of Life would be unable to exist.'¹

Do these observations of Organic Nature hold good for Mankind? Is the individual human being so far from possessing a Cyclopean independence that he is actually no more than a cell in the body social of the society to which he belongs, or, on a wider view, a cellule in the vaster body of 'a single great individual' which is constituted by 'the whole organic world'? The well-known original frontispiece to Hobbes's *Leviathan* pictures the human body social as an organism built up out of a host of Anaxagorean *homoeo-*

¹ Huxley, J. S.: *The Individual in the Animal Kingdom* (Cambridge 1912, University Press), pp. 36-8 and 125.

meriae which are individual human beings—as though the ‘social contract’ could have the magical effect of degrading a Cyclops into a cell. The same picture of the individual human being as an only partially emancipated part of a social whole which has acquired for itself some elements of individuality is presented, rather more tentatively, by the twentieth-century English biologist whom we have just been quoting:

‘One interesting property gained by brains and sense-organs:—organisms possessing them can easily enter into more than one individuality. . . . A man can very well be at one time a member of a family, a race, a club, a nation, a literary society, a church and an empire. “Yes, but surely *these* are not individuals”—I seem to hear my readers’ universal murmur. . . . Here we can but express a pious opinion:—that they *are* individuals, that here once more the tendency towards the formation of *closed systems* has manifested itself, though again in very varying degrees, so that some of the systems show but a glimmer of individuality, others begin to let it shine more strongly through. That their individuality is no mere phantasm I think we must own when we find men like Dicey and Maitland admitting that the cold eye of the Law, for centuries resolutely turned away, is at last being forced to see and to recognize the real existence, as single beings that are neither aggregates nor trusts, of corporate personalities.’²

A state of human life in which the corporate personality of a society has completely overshadowed and dominated and subordinated to itself the individual personalities of the human beings belonging to it is pictured, in an eschatological phantasy, by a twentieth-century English biochemist.³

‘After the immense efforts of the first colonisers [of the Planet Venus], we have settled down as members of a super-organism with no limits to its possible progress. The evolution of the individual has been brought under complete social control, and besides enormously enhanced intellectual powers we possess two new senses. The one enables us to apprehend radiation of wave-lengths between 100 and 1,200 metres, and thus places every individual at all moments of life, both asleep and awake, under the influence of the voice of the community. It is difficult to see how else we could have achieved as complete a solidarity as has been possible. We can never close our consciousness to those wave-lengths on which we are told of our nature as components of a super-organism or deity, possibly the only one in Space-Time, and of its past, present and future. It appears that on Earth the psychological equivalent of what is transmitted on these wave-lengths included the higher forms

¹ See Lucretius, *De Rerum Natura*, Bk. I, ll. 830 seqq.

² Huxley, *op. cit.*, p. 143.

³ See the sketch entitled ‘The Last Judgement’ in Haldane, J. B. S.: *Possible Worlds* (London 1928, Chatto and Windus), especially pp. 302–5 and 308–9. The author works out very ingeniously the implications of ‘a life completely dedicated to membership of a super-organism’ (*op. cit.*, p. 303).

of art, music and literature, the individual moral consciousness, and, in the early days of Mankind, religion and patriotism. The other wavelengths inform us of matters which are not the concern of all at all times, and we can shut them out if we so desire. Their function is not essentially different from that of instrumental radio-communication on Earth. The new magnetic sense is of less importance. . . .¹

This conception of a human society as a super-organism is presented in a fantasia by the twentieth-century English biochemist because he does not regard it as anything more than a speculative curiosity. But a nineteenth-century English social philosopher once argued that human societies were super-organisms in sober earnest;² and a twentieth-century German social philosopher has ventured to reaffirm dogmatically that the historic societies that we call civilizations are actual examples of super-organisms—and this, apparently, in the literal sense, with all its implications.

'Civilizations (*Kulturen*)³ are organisms. The History of Civilization (*Kulturgeschichte*) is the biography of these organisms. The history (*Geschichte*) of the Chinese [i.e. the Sinic] or the Antique [i.e. the Hellenic] Civilization, which presents itself to us, before our mind's eye, as "History" in the conventional sense (*in historischer Erscheinung*), is the exact counterpart of the history (*Geschichte*) of the individual human being, or of an animal or of a tree or of a flower. If we wish to gain insight into its structure, the proper method has been worked out long ago in the science of the comparative morphology of plants and animals. . . .

'A civilization is born at the moment when, out of the primitive psychic conditions of a perpetually infantile [raw] Humanity, a mighty soul awakes and extricates itself: a form out of the formless, a bounded and transitory existence out of the boundless and persistent. This soul comes to flower on the soil of a country with precise boundaries, to which it remains attached like a plant. Conversely, a civilization dies if once this soul has realized the complete sum of its possibilities in the shape of peoples, languages, creeds, arts, states, and sciences, and thereupon goes back into the primitive psyche from which it originally emerged.'⁴

In this remarkable passage, the conception of a society as a super-

¹ Haldane, J. B. S.: *Possible Worlds* (London 1928, Chatto and Windus), pp. 304-5.

² This was, of course, Herbert Spencer in his *Principles of Sociology*, vol. i (London 1876, Williams and Norgate). The thesis that societies are organisms is worked out systematically, in detail, in part (ii). See, for example, pp. 514-15, in which 'the classes engaged in manual occupations' are equated with 'the components of the alimentary surfaces'; the trading class with the vascular system; and the 'controlling' class with the brain.

³ In Spengler's terminology, a *Kultur* means what, in this Study of History, is called a civilization, so long as the civilization is in process of growth. *Zivilisation*, which for Spengler is the antithesis of *Kultur*, means the condition into which a civilization (in our sense) falls when it breaks down and goes into disintegration.—A. J. T.

⁴ Spengler, Oswald: *Der Untergang des Abendlandes*, vol. i, 15th-22nd ed. (Munich 1920, Beck), pp. 150 and 153.

organism is formulated in such uncompromising terms that it virtually refutes itself; but we may cite a formal condemnation of it from the work of an English publicist which happened to appear in the same year as Spengler's book.

'Again and again, social theorists, instead of finding and steadily employing a method and a terminology proper to their subject, have attempted to express the facts and values of Society in terms of some other theory or science. On the analogy of the physical sciences they have striven to analyse and explain Society as *mechanism*, on the analogy of biology they have insisted on regarding it as an *organism*, on the analogy of mental science or philosophy they have persisted in treating it as a *person*, sometimes on the religious analogy they have come near to confusing it with a God.

'These various analogies have very different degrees of value and disvalue. The mechanical analogy and the organic analogy have been alike definitely harmful and have led theory seriously astray; for they both invoke a material analogy in what is essentially a mental or spiritual study.¹ The analogies drawn from psychology and mental philosophy are far less harmful and may be even extremely suggestive if they are not pushed too far; for though neither Society nor the various associations which it includes are "persons", they approach far more nearly to being persons than to being either mechanical or organic.'²

The biological and psychological analogies are perhaps least harmful and least misleading when they are applied to primitive societies in their present static condition or to those exceptional and unsuccessful civilizations that have fallen into a state of arrest.³ But they are manifestly unsuited to express the relation in which the growing civilizations stand to the individual human beings who 'belong' to them—or to whom such societies 'belong'. The inclination to introduce these particular analogies in this context seems to be a peculiar infirmity of our own Western social philosophers; and we may trace this infirmity to the special penchant—noted in an earlier passage of this Study⁴—which we in our Western Society seem to have for personifying groups or classes or associations of human beings, or human social institutions, by the device of labelling them with mythological proper names: 'Britain', 'France', 'Czechoslovakia'; 'His Majesty's Government' and 'The London County Council'; 'the Church', 'the Bar', 'the Press', 'the Turf', 'the Trade'. The distorting effect of these fictitious personifications upon historical thought and historical narrative has been discussed

¹ 'We may, if we will, speak of the "organs of the body social" or of the "machinery of society", but we must beware of regarding such phrases as more than metaphors or of basing any conclusions at all upon them.' (Ibid., p. 21.)

² Cole, G. D. H.: *Social Theory* (London 1920, Methuen), pp. 13-14.

³ For the arrested civilizations, see the present Part III. A, above.

⁴ See I. C (iii) (e), Annex, vol. i, pp. 442-5, above.

in this Study already¹ and need not be re-emphasized here. It is sufficiently evident that the representation of a society as a personality or as an organism does not offer us an adequate or accurate expression of the society's relation to its individual human 'members'. A human society is not a whole of which the individual human beings are parts, any more than it is an aggregate of individual human atoms that are free to associate or dissociate at will.

What, then, is the true relation between human societies and individuals? The truth seems to be that a human society is, in itself, a relation: a particular kind of relation between human beings who are not only individuals but are also social animals in the sense that they could not exist at all—or at any rate not humanly—without being in this social relation with one another. The species of human relation of which our human societies are one sample is known to us already. At an earlier point in this Study,² we have noticed that 'the social relations of human beings extend beyond the furthest possible range of personal contacts, and' that 'these impersonal relations are maintained through social mechanisms called institutions. Without institutions, societies could not exist. Indeed, societies themselves are simply institutions of the highest order—institutions, that is, which comprehend without being comprehended by others. The study of societies and the study of institutional relations are one and the same thing.'

The nature of these social or institutional relations between individual human beings is thus the ultimate object of our present inquiry into the relations between individuals and societies. But, before we can go further, we shall have to remind ourselves of the nature of these human individuals, or social animals, whose relations with one another we are trying to study; and we shall have to consider incidentally the nature of 'relations' in general.

The very concept of 'relations' between 'things' or 'beings' involves the logical contradiction that something which is *ex hypothesi* separate and self-contained and individual and exclusive has also to be conceived as somehow overlapping with other entities of the same order. How is this contradiction to be transcended? Only, perhaps, by substituting 'actions' for 'things' and 'agents' for 'beings' and 'interaction' for 'overlapping' as our formulae for describing 'the nature'—or, rather, 'the working'—of the Universe. Let us follow, along this path, the South African philosopher-statesman whose guidance we have sought on many occasions.

'Action does not come to a stop in its structures; it remains Action, it remains in action. In other words, there is more in bodies, things and events than is contained in their structures or material forms. All

¹ In loc. cit.

² In I. C (iii) (e), Annex, vol. i, pp. 454-5, above.

things overflow their own structural limits, the inner Action transcends the outer structure, and there is thus a trend in things beyond themselves. This inner trend in things springs from their very essence as localised, imprisoned Action. From this follow[s] . . . the concept of things as more than their apparent structures, and their "fields" as complementary to their full operation and understanding. A thing does not come to a stop at its boundaries or bounding surfaces. It is overflowing Action, it passes beyond its bounds, and its surrounding "field" is therefore essential not only to its correct appreciation as a thing, but also to a correct understanding of things in general, and especially of the ways in which they affect each other.¹

This suggestive concept of 'fields' is applied by the philosopher to Action of diverse kinds on different planes.

'Round every luminous point in experience there is a penumbra, a gradual shading off into haziness and obscurity. A "concept" is not merely its clear luminous centre but embraces a surrounding sphere of meaning or influence of smaller or larger dimensions, in which the luminosity tails off and grows fainter until it disappears. Similarly a "thing" is not merely that which presents itself as such in clearest definite outline, but this central area is surrounded by a zone of vague sense-data and influences which shades off into the region of the indefinite. The hard and abrupt contours of our ordinary conceptual system do not apply to reality and they make reality inexplicable, not only in the case of causation, but in all cases of relations between things, qualities and ideas. Conceive of a cause as a centre with a zone of activity or influence surrounding it and shading gradually off into indefiniteness. Next conceive of an effect as similarly surrounded. It is easy in that way to understand their interaction, and to see that cause and effect are not at arm's length but interlocked, and embrace and influence each other through the interpenetration of their two fields. In fact, the conception of fields of force which has become customary in Electro-magnetism is only a special case of a phenomenon which is quite universal in the realms of thought and reality alike. Every "thing" has its field, like itself, only more attenuated; every concept has likewise its field. It is in these fields and these fields only that things really happen. It is the intermingling of fields which is creative or causal in Nature as well as in Life. The hard secluded thing is barren because abstract, and but for its field it could never come into real contact or into active or creative relations with any other thing or concept. Things, ideas, animals, plants, persons: all these, like physical forces, have their fields, and but for their fields they would be unintelligible, their activities would be impossible, and their relations barren and sterile.'²

If we realize the existence of fields and recognize their importance, our thought runs on to explore their ranges; and our philosopher-statesman cites a contemporary philosopher-mathematician

¹ Smuts, J. C.: *Holism and Evolution*, 2nd ed. (London 1927, Macmillan), p. 336.

² Smuts, *op. cit.*, pp. 17-18.

for the view that the field of any given 'thing' or 'event' extends to the totality of the Universe. Professor Whitehead, General Smuts observes,

'arrives at the result that a thing or event is not confined to its own simple Space-Time location, and is thus not itself alone, but that it reflects the aspects of all other things and events from its particular standpoint, and thus in a sense involves their locations also. In the larger context of Nature the thing or event is therefore a synthesis of itself with the aspects or perspectives of everything else as mirrored from its standpoint. Whitehead's searching analysis leads to results which closely resemble those of Leibniz's *Monadology*.¹

On the plane of physical phenomena, this doctrine means that each single atom or proton or electron, and each single ray of radiation, embraces the entire Physical Universe, inasmuch as its field of action has no narrower range than that. And a modern French philosopher, Monsieur Henri Bergson, argues, on the same principle, that the entire material universe is virtually included in the material body of each single human being.

'People never tire of repeating that Man is an insignificant speck on the Earth, and the Earth in the Universe. Yet, even in respect of his body, Man is far from occupying merely the tiny place which is usually assigned to him, and with which Pascal himself was content when he reduced "the thinking reed" to no more than a reed materially. For if

¹ Smuts, *op. cit.*, p. 22, referring to Whitehead, A. N.: *Science and the Modern World* (Cambridge 1927, University Press). See also Smuts's note, in *Holism and Evolution*, pp. 121-4, on 'Whitehead's doctrine of Organic Mechanism'. This doctrine, which is Whitehead's central theme in *Science and the Modern World*, is enunciated there, in precise terms, on pp. 99 and 134, while on p. 193, *ibidem*, Whitehead touches upon the relation of his own philosophy to that of Leibniz. In Leibniz's philosophy, the ultimate substances or entities or realities—for which Leibniz has coined the term 'monads'—are individual centres of perception, each of which mirrors the Universe:

'Chaque monade est un miroir vivant de l'univers suivant son point de vue.' (*Leibnitii Opera Philosophica*, edited by Erdmann, J. E. (Berlin 1840, Eichler), p. 725.) 'Et comme une même ville regardée de différens côtés paroît tout autre et est comme multipliée perspectivement, il arrive de même que par la multitude infinie des substances simples, il y a comme autant de différens univers, qui ne sont pourtant que les perspectives d'un seul selon les différens points de vue de chaque monade' (*op. cit.*, p. 709).

From this faculty of reflecting or perceiving the Universe, which Leibniz ascribes to his monads, he argues that each monad enjoys self-determination:

'Les monades qui sont les véritables et uniques substances, ne sauroient être empêchées naturellement dans leurs déterminations intérieures, puisqu'elles enveloppent la représentation de tout externe' (*op. cit.*, p. 722). 'Elles ont en elles une certaine perfection; il y a une suffisance qui les rend sources de leurs actions internes et pour ainsi dire des automates incorporels' (*op. cit.*, p. 706).

But this very self-determination implies that one monad cannot be acted upon by—and therefore, conversely, cannot itself act upon—any other monad:

'Il n'y a pas moyen . . . d'expliquer comment une monade puisse être altérée ou changée dans son intérieur par quelque autre créature, puisqu'on n'y sauroit rien transposer ni concevoir en elle aucun mouvement interne qui puisse être excité, dirigé, augmenté ou diminué là-dedans. . . . Les monades n'ont point de fenêtres, par lesquelles quelque chose y puisse entrer ou sortir' (*op. cit.*, p. 705. Cf. pp. 680 and 709 and 728).

Thus, while the Leibnizian monads have the whole Universe for their field of perception, they apparently have no fields of action at all.

For further light, see Russell, Bertrand: *A Critical Exposition of the Philosophy of Leibniz* (Cambridge 1900, University Press).

our body is the matter to which our consciousness attaches itself, then it is coextensive with our consciousness, it comprehends all that we perceive, it stretches to the stars. But this immense body changes every instant—and sometimes radically—through the slightest displacement of one particular part of itself which occupies its centre and which keeps within a tiny space. This interior and central body, which is relatively invariable, is always present. And it is not only present; it is active: it is through it, and through it alone, that we are able to move other parts of the great body. Since it is action that counts, and since it is taken for granted that we are in the place where we act, it is customary to confine the consciousness within the tiny body and to ignore the immense body . . . [yet], if the surface of our very small organized body (which is organized precisely with a view to immediate action) is the locus of our actual movements, our very large inorganic body is the locus of our eventual and our theoretically possible movements. No doubt, everything happens *as though* our external perceptions were constructed by our brain and projected by it into space; but this is merely because the perceptive centres of the brain perform the necessary explorations and preparations for these eventual actions and sketch the design of them within. The truth is quite different; and we *are* really *in* everything that we perceive, though we happen to be represented there by parts of ourselves which vary without ceasing and which are occupied by actions that are only virtual.¹

In this passage, the modern Western philosopher contents himself with equating the individual human body, by virtue of its 'field', with as much of the material universe as happens at any given moment to come within the individual human being's range of action and perception and thought. An old school of Western thinkers went the length of equating the individual human soul with the entire Universe, on all its planes and in all its aspects, when they made their dichotomy between Microcosm and Macrocosm: a dichotomy which applies alike to the Soul and to the Universe itself. In the Microcosm, the Universe is mirrored or concentrated in the Soul; in the Macrocosm, the Soul ranges over a 'field' that is coextensive with the Universe; and the sum of things—the ultimate Whole which remains undivided and indivisible in reality, notwithstanding the logical dichotomy that has been practised upon it by human thought—is Soul and Universe in one.

In this now old-fashioned anticipation (or implementation) of a modern idea, we have found one answer to the question before us. It seems that individual human beings are related with one another through having individual fields of action that are each coextensive with the Universe and therefore all coextensive *inter se*. But, like so many of the intuitions of the medieval scholastic genius, this answer

¹ Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 276-7.

to a practical question is no answer for practical purposes. For to say that people are related with each other through fields that have no limits short of the Universe is virtually to say that they enter into their mutual relations at Infinity; and this leaves as obscure as ever the nature of their empirically observed relations in those mundane human societies, with their unique locations in Space-Time, that are the actual objects of this Study. Empirical observation has informed us, in objective terms, that these societies are institutions which, for our practical purposes, are of the highest order, in the sense that they comprehend other institutions without being comprehended by others in their turn.¹ In subjective terms we have found, by the same empirical test, that, for the same practical purposes, these same societies are also 'intelligible fields of study'.² In practice, therefore, our question will not have received a satisfactory answer until we have grasped the nature of the empirically observed relations between human individuals in these social fields which are neither universal in their range nor infinitely remote.³ Does the philosophically true but practically unsatisfying answer which we have obtained from the oracle of Scholasticism furnish any clue for discovering an answer in our own practical terms? Perhaps we can make the transit from the theoretical to the practical answer to our question by way of a mathematical simile.

Let us represent our human individuals, whose social relations we are trying to grasp, by any number of points on a plane; and from each one of these points, as an apex, let us produce a cone to represent each individual's field of action. Some of these cones may expand rapidly, at an obtuse angle; others may expand gradually, at angles that are more acute; and the central spine or axis of each cone may take off at any angle from the common plane on which all the apices lie. Our only postulate is that the cones shall all be produced into the third dimension on one and the same side of our original plane (which offers, of course, two alternative sides on which our three-dimensional figures may be constructed). Let us now decree that every one of these cones shall be produced,

¹ See Part I. C (iii) (e), Annex, vol. i, p. 455, above.

² See Part I. A and also I. C (iii) (e), Annex, vol. i, p. 443, above.

³ The problem that confronts us here has been formulated as follows, in 'holistic' terms, by General Smuts:

'What limits are there to the field of an inorganic body or an organism or a personality? Leibniz represented each monad as containing or mirroring the whole Universe in its own way and from its own particular angle; lower monads, of course, more imperfectly than higher monads; but each in its own degree is a sort of Microcosm or miniature Universe. In other words, each tiniest least monad is in a sense cosmic and universal. This description would not apply to a "field". As we have seen, a "field" is of the same character as the inner area of the whole, only more attenuated in its force and influence, and the farther it recedes from that area the greater the attenuation; so that the field, though theoretically indefinite in extent, is in effect quite limited in practical operation.' (Smuts, *op. cit.*, pp. 347-8.)

on the (conventionally determined) productive side of our plane, from its apex on and on into Infinity. This decree ensures mathematically that, notwithstanding the diversity of the respective angles at which our cones take off from our plane, the ultimate cross-section of every cone will coincide in area with the ultimate cross-section of every other cone; for, on a plane that lies at an infinite distance from our original plane of departure, all our cones alike will project themselves in cross-sections with infinite and therefore coextensive areas. At the same time, we shall find that the sections of a certain number—though only a certain number—of our cones do coincide in area at each and every distance, short of infinity, from the productive face of our original plane, at which we choose to describe another plane parallel to it. For, as our cones which we are producing from our original plane traverse any one of these other planes, at some finite distance from the first, on their way towards Infinity, they will each leave their mark on the second plane in the shape of a conic section; and while these conic sections will naturally differ from one another in location and size and form according to the point on the original plane from which each particular cone has taken off, and according to the angles that govern its production, it will be found, as a matter of fact, that the conic sections imprinted on the second plane by a certain number of different cones that have taken off from the first plane at different points and at different angles will actually coincide with one another—coinciding, in this case, at a finite and not at an infinite distance from their respective apices, and in a finite and not in an infinite area.

Before we proceed to the interpretation of this simile, it may be well to make the mathematical construction clearer by translating it into concrete terms. For our original plane let us take the surface of the Earth; let our points on this surface be represented by search-light projectors; and let these projectors be without those prisms of crystal or glass by means of which the beams of light that are projected from ordinary search-lights are diverted, at the outset, from their natural paths and are made to travel parallel to one another in the form of a shaft instead of following their natural bent and diverging cone-wise. These natural cones of radiating light will thus take off from the surface of the Earth at different points and at different axial angles and at different degrees of obtuseness or acuteness according to the particular structures and locations and bearings of the particular projectors from which they respectively emanate; and—just as in the case of our abstract mathematical cones—their cross-sections will all be coextensive with one another at Infinity. In the concrete illustration, however, we are confronted at once with the gulf between theory and practice; for it is

evident that, in practice, this theoretical coincidence of all the cross-sections of all our light-cones will never be realized. It will not be realized because the light-cone—which is the 'field' of radiation of the projector—becomes more and 'more attenuated in its force and influence the farther it recedes from' the lamp that is the source from which the radiation is emitted, 'so that the field, though theoretically indefinite in extent, is in effect quite limited in practical operation'.¹ Moreover, in the particular concrete case that we are imagining, the field of our search-light's cone-shaped radiation is limited in a double way: not only by the attenuation of the light as it travels, but also by the interposition of opaque bodies that prevent its further progress—even before it has petered out—towards the Infinity which it would never actually reach in any event. These obstructive bodies are the layers of cloud that float in the atmosphere on planes that are roughly parallel to the Earth's solid and liquid surface; and the under-surface of one of these cloud-layers will receive the imprint of a conic section from each one of the light-cones, emanating from our projectors, whose further progress this particular cloud-layer happens to bar. With this cloud-surface to play upon, the expert human manipulators of the projectors will be able so to adjust their angles of projection that the conic sections of the light-cones that are projected on to the cloud-surface from different points and at different angles will overlap with one another so closely as virtually to coincide. Indeed, this power of making the sections of the beams of search-lights coincide, for practical purposes, at distances but little removed from the solid or liquid surface of the Earth is the power that gives the invention of the search-light its practical value for Man. As *Homo Belligerans*, he focuses his convergent beams upon a single point on an aerial plane that is determined by the momentary presence of a hostile piece of aircraft; as *Homo Coponans*, he focuses upon a point on a plane that is embodied materially in the under-surface of a cloud in order to advertise his wares by 'sky-writing'.

The concrete version of our simile has probably made an interpretation superfluous; but, for the reader's possible convenience, we will give the key nevertheless. The points on the surface of a mathematical plane, or the search-light projectors on the surface of the Earth, represent individual human beings; the mathematical cones, or light-cones, represent these individuals' respective fields of action; the second plane, or the under-surface of the cloud-layer, upon which the cones impinge at some finite range in the course of their production towards Infinity, represents the social animal's

¹ See the passage quoted from Smuts, op. cit., on p. 227, footnote 3, above.

sociality; and the coincidence of a certain number of the conic sections imprinted on this surface represents the coincidence of the fields of action of a certain number of individual human beings—a coincidence which constitutes a society.

If this simile has any substance in it, it may now yield us a definition of what a human society is. A society, we may say, is a relation between individuals; and this relation of theirs consists in the coincidence of their individual fields of action; and this coincidence combines the individual fields into a common ground; and this common ground is what we call a society. Inasmuch as an individual's field of action is a part or aspect of the individual himself, each single individual is in a sense coextensive and indeed identical with the whole of the society in which he is a shareholder or in which he has a vested interest—to apply a metaphor from the business practice of the modern Western World. On the other hand, inasmuch as the Microcosm is distinct and distinguishable from the Macrocosm—and it is only in the field of the Macrocosm, and not in the fastness of the Microcosm, that the different individuals interact—it cannot be said that every individual is identical with every other, in spite of their being each identical with the society through which they are related. In this 'political arithmetic' or 'social geometry', the Euclidean axiom that 'things which are equal to the same thing are equal to one another' apparently does not hold.

The foregoing investigation into the nature, or the working, of human societies has incidentally brought out a point which is of great importance for the next stage of our inquiry. Our analysis of phenomena into agents and their fields of action implies not only that 'the stuff or material of the Universe' is 'activity instead of matter',¹ but also that this activity originates in one, and one only, of its two poles and can only flow in the one direction. The mathematical cones in our simile were produced from their apices; the light-cones were radiated from the search-light projectors; the Macrocosm is apprehended and acted upon by the Microcosm; and the action which is the theme of human history is the action of individual human beings on that common ground of their respective fields of action which we call a society.

A field of action—and, *a fortiori*, an intersection of a number of fields of action—cannot be a source of action. The source of action is other than the field of action *ex hypothesi*. And—to apply this truism to the case in point—the source of social action cannot be the society, but can only be each or some or one of the individuals whose fields of action constitute a society on the ground where they coincide. A 'field' or a 'relation' is condemned, by its very nature,

¹ Smuts, *op. cit.*, p. 335.

to the impotence which is ascribed to the abstract human intellect in the Aristotelian aphorism.¹ It 'moves nothing'. A 'field' merely provides a locus for the action of an agent who operates in the field but who is not the field itself; a 'relation' merely provides a common ground for the interaction of two or more agents with one another. Just as mathematical Space takes no action itself, but merely lends itself to the action of particular electrons or atoms or vibrations, each of which occupies the whole of Space for its field, so a human society is inherently incapable of playing an active, creative role in human affairs. The society is not, and cannot be, anything more than a medium of communication through which the individual human beings interact with one another. It is human individuals and not human societies that 'make' human history.²

This truth is stated forcibly and insistently by Bergson in the work which we have been quoting repeatedly in this part of our Study.

'We do not believe in the "unconscious" [factor] in History: the "great subterranean currents of thought", of which there has been so much talk, only flow in consequence of the fact that masses of men have been carried away by one or more of their own number. . . . It is useless to maintain that [social progress] takes place of itself, bit by bit, in virtue of the spiritual condition of the society at a certain period of its history. It is really a leap forward which is only taken when the society has made up its mind to try an experiment; this means that the society must have allowed itself to be convinced, or at any rate allowed itself to be shaken; and the shake is always given by *somebody*. It is useless to allege that this leap forward does not imply any creative effort at the back of it, and to argue that there is not here any invention comparable to the artist's. This is to ignore the fact that the majority of the great successful reforms have appeared at first unrealizable and have been so in fact. They could only be realized in a society whose spiritual condition was already that which these reforms were to induce through their realization; and there was a vicious circle here from which no issue would have been found if the circle had not been broken by one or more privileged souls which had dilated the social soul in themselves and which then drew the society after them [through the breach which they had made]. Now, this is just what we mean by the miracle of artistic creation.'³

³ Bergson, op. cit., pp. 333 and 73-4. Compare p. 102. In another passage (in op. cit., p. 124) Bergson suggests that 'it is only in Humanity that the effort of invention, which

The individuals who perform this miracle of creation, and who thereby bring about the growth of the societies in which they arise, are more than mere men. They can work what to men seem miracles because they themselves are superhuman in a literal and no mere metaphorical sense.

'In giving to Man the moral conformation which he required in order to be a social animal, Nature has probably done all that she was able to do for the Human Species. But, just as men of genius have been found to push back the bounds of the human intelligence (which means that, at long intervals, individuals have been granted far more than it was originally possible to give, all at once, to the species), so there have arisen privileged souls who have felt themselves related (*apparentés*) to all souls, and who, instead of remaining within the limits of their group and keeping to the [restricted] solidarity that has been established by Nature, have addressed themselves to Humanity in general in an *élan* of love. The apparition of each of these souls has been like the creation of a new species composed of one unique individual—the thrust of Life arriving, at long intervals, in the person of a particular human being, at a result which could not have been attained all at once for the aggregate of Mankind. Thus each of these souls has marked the attainment of a certain point by the evolution of Life; and each of them has manifested in an original form a love which seems to be the very essence of the creative effort.'

For Bergson, it is the mystics who are the superhuman creators *par excellence*, and he finds the essence of the creative act in the supreme moment of the mystical experience.

'Shaken to her depths by the current that is to carry her away, the Soul ceases to turn upon herself and escapes for one instant from the law which requires the species and the individual to condition one another in a vicious circle. The Soul stops still, as though she heard a voice calling her. Then she lets herself go—straight forward.'

What is the new specific character of these rare and superhuman

manifests itself in the whole domain of Life through the creation of new species, has discovered the means of carrying on through individuals who are endowed with intelligence and who are therewith made the repositories of the faculties of initiative, independence and liberty.'

¹ Bergson, *op. cit.*, pp. 96–7. Compare pp. 228 and 289. It is interesting to find the same conception appearing a few years earlier in the work of a contemporary English writer whose mental background would appear to be very different from our French philosopher's.

'Jesus . . . was a new kind of man, literally, scientifically; a new species of the *Genus Homo*. . . A new species of the *Genus Homo*, for the ordinary biologist, would mean a man with an extra eye, or a rudimentary fin where his tail should be. . . But . . . the coherence which we discern in the life of Jesus . . . is organic on a higher level than the pure biological. . . The differentiating characteristic of this new man, as we regard him, lies first in his apprehension in immediate experience of an all-pervading Unity, and second, and more importantly, in the perfection of his obedience to it. . . Jesus is not the unique example of the new man. One very clear and relatively modern example is the English poet, John Keats. . . I find very evident traces of the same kind of development in Spinoza, in Goethe, in Shakespeare, in Blake, and in some of the great Christian mystics.' (Murry, John Middleton: *God* (London 1929, Cape), pp. 111–18.)

² Bergson, *op. cit.*, pp. 245–6. Compare p. 84.

souls that break the vicious circle of primitive human social life and resume the work of creation? The new factor may be described as 'Personality'.

'Personality is still a growing factor in the Universe, and is merely in its infancy. Its history is marked by the thousands of years, whereas that of Organic Nature is marked by millions. Personality is as yet but an inchoate activity of the whole, but nevertheless its character is already distinct and well marked; and its future evolution is the largest ray of hope in human, if not terrestrial, destiny. . . . The level of its power and activity is gradually rising; more and more it is gathering the unorganized centrifugal tendencies of the individual into an effective central control, and often it wins even in the most discouraging circumstances those moral victories which form the great landmarks of personal and human progress.'

It is through the inward development of Personality that individual human beings are able to perform those creative acts, in their outward fields of action, that cause the growths of human societies; and so we find that this enhancement of the individual's mastery over the Macrocosm is the consequence of a corresponding achievement in the Microcosm—of a progress in self-articulation or self-determination within. The outward and the inward advance in organization and increase in power are so intimately connected that either can be described in terms of the other.

'The nature of Personality is distinguished by its departure from the processes of Organic Nature and an approximation to the forms of action which are characteristic of Society. Just as in a well-organized society or state there is a central legislative and executive authority which is for certain purposes supreme over all individuals composing that society or state, and controls their activities in certain definite directions deemed necessary for the welfare of the state, so the human personality is distinguished by an even more rigorous inner control and direction of the personal actions to certain defined or definable ends. . . . The ideal personality is he in whom this inner control is sufficiently powerful, whether exercised by conscious will or some unconscious activity, to harmonize all the discordant elements and tendencies of the personal character into one harmonious whole, and to restrain all wayward, random activities which are in conflict with that harmony.'

In the South African philosopher's analysis of Personality and

¹ Smuts, *op. cit.*, pp. 306 and 308.

² Smuts, *op. cit.*, pp. 305-6. On p. 107 the author draws the following contrast between the soul which has achieved Personality and the soul which has not succeeded in achieving it:

'Consider for a moment what distinguishes the formed and developed personality from the unformed and incomplete personality; the strong character from the weak; the master of his fate from him who is blown about by every wave of impulse or opinion. In the latter case—the case of the weak, or flabby, or irresolute person—you have usually the same elements of character as in that of the strong man. But the difference is that while in the case of the strong man or personality all these elements are unified into one central whole which shapes and directs their separate activities, in the case of the weak

in the French philosopher's account of the mystical experience¹ we are given a glimpse of the process by which, in the souls of certain individual human beings, a new spiritual species—a veritable Superman—emerges. The mystically illumined Personality evidently stands to ordinary Human Nature as civilizations stand to primitive human societies. In both cases, the new species is evolved from the old through a passage from a temporary state of quiescence into a bout of dynamic activity. In both cases, likewise, the new chapter of history implies, and in fact demands, a sequel; for 'all things overflow their own structural limits . . . and there is thus a trend in things beyond themselves'.² Civilizations that have succeeded in coming to birth not only tend to grow, but also tend to impinge upon other societies in the pluralistic social universe which has been the field of human history up to date.³ Similarly, personalities that have succeeded in attaining self-determination through self-mastery find, in the act, that they cannot live and cannot die unto themselves;⁴ that, having been lifted up, they cannot rest until they have drawn all men unto them;⁵ because it is for this that they are come into the World.⁶

'The soul of the great mystic does not come to a halt at the [mystical] ecstasy as though that were the goal of a journey. The ecstasy may indeed be called a state of repose, but it is the repose of a locomotive standing in a station under steam pressure, with its movement continuing as a stationary throbbing while it waits for the moment to make a new leap forward. . . . Henceforward, the soul has a superabundance of life; it has an immense *élan*; it has an irresistible thrust which hurls it into vast enterprises. . . . The great mystic has felt the truth flow into him from its source like a force in action. He could no more stop himself from spreading it than the Sun could stop himself from pouring out his light. . . . His desire is with God's help to complete the creation of the Human Species and to make of Humanity what it would have been from the beginning if it had been capable of constituting itself definitively without the help of Man himself. Or, to use words which . . . say

man these elements of thought, emotion, will, and passion have never been harmonized or fused into one whole; the sovereign legislative and executive authority in the personality has never been properly constituted or exerted, or is so weak as to be regularly disobeyed and defied; the unorganized and uncoordinated factions in the character fight for their own hand and keep up a constant state of inner warfare in the personality, with the result that the stronger passions or impulses carry the day and ruin the character, which depends on a harmonious subordination of all the various elements of character under one supreme ethical authority. The inner discord may even proceed the length of apparent dissociation of the personality and lead to the singular phenomenon of multiple personality in the same individual.'

The spiritual struggle in which the emergent personality brings psychic order out of psychic anarchy in the Microcosm, and social growth out of social stagnation in the Macrocosm, is delineated with the poetic imagination and the emotional intensity of genius in the seventh chapter of the Epistle to the Romans.

¹ Bergson, *op. cit.*, pp. 243-9.

² Smuts, *op. cit.*, p. 336, quoted on pp. 223-4, above.

³ The phenomena arising from the contacts between civilizations are discussed in Parts IX and X, below. For the contacts between civilizations and barbarians, see Part VIII, below.

⁴ Romans xiv. 7.

⁵ John xii. 32.

⁶ John xvi. 28.

the same thing in different language, the mystic's direction is the very direction of the *élan* of Life. It is that *élan* itself, communicated in its entirety to privileged human beings whose desire it is thereafter to set the imprint of it upon the whole of Mankind and—by a contradiction of which they are aware—to convert a species, which is essentially a created thing, into creative effort; to make a movement out of something which, by definition, is a halt.¹

This contradiction is the crux of the dynamic social relation which arises between human beings upon the emergence of mystically inspired personalities and which resolves itself—if it achieves a resolution of its forces—in the growths of civilizations.² The necessity which impels a creative personality to transfigure his fellow men into fellow creatures by re-creating them in his own image is both internal and external. The internal necessity lies in the identity of Life and Action. No being can be what he is unless he is putting his essence into action in his field. But a human being's field of action lies in a society which is common ground between his field and the fields of a host of other people; and it is here that the necessity translates itself into external pressure when the individual agent happens to be a genius who represents 'a new species composed of one unique individual'.³ The creative mutation in the Microcosm requires an adaptative modification in the Macrocosm before it can become either complete or secure; but, *ex hypothesi*, the Macrocosm of the transfigured personality is also the Macrocosm of his untransfigured fellow men; and accordingly his effort to transform the Macrocosm in consonance with the change in himself will be resisted by their inertia, which will tend to keep the Macrocosm in harmony with their unaltered selves by keeping it just as it is.

¹ Bergson, *op. cit.*, pp. 246-51.

² The crux does not present itself in situations where the social relations between human beings are not dynamic but static: e.g. in civilizations that have suffered arrest, or in stagnant or quiescent primitive societies that have not entered upon the path of civilization at all. In primitive societies in their latter-day 'Yin-state' of integration—which happens to be the only condition in which we have direct knowledge of them—social activity is crystallized or solidified in a 'cake of custom' (see the quotation from Bagehot in II. B, vol. i, p. 192, above); and the social relations established between each individual and every other on the common ground of their respective fields are repetitive and uniform and invariable or, in other words, stable. The crux only presents itself when 'the cake of custom' breaks. Presumably it did present itself in the 'Yang-activity' of differentiation to which the latter-day 'Yin-state' of Primitive Humanity is the sequel. In that phase of evolution, Humanity was achieved through a mutation of Sub-Man into Man (see I. C (iii) (e), vol. i, pp. 179-80, and II. B, vol. i, pp. 192-5, above); and since it appears that our pre-human ancestors who accomplished this mutation were already social or at any rate gregarious animals (see I. C (iii) (c), vol. i, pp. 173-4, above), it is conceivable that this pre-human mutation worked, like the post-human mutation that is struggling to achieve itself in the growths of civilizations, through a social conflict between individuals: in this case between incipient human beings and their recalcitrant sub-human kin and kind. But we have no record of this momentous chapter of history; and Bergson (*op. cit.*, p. 124) may be right in his view that it is only in our own post-human phase of evolution that the instrument and agent of creation has come to be the individual.

³ Bergson, *op. cit.*, pp. 96-7, quoted on p. 232, above.

This social situation presents a dilemma. If the creative genius fails to bring about in his milieu the mutation which he has achieved in himself, his creativeness will be fatal to him. He will have put himself out of gear with his field of action; and in losing the power of action he will lose the will to live—even if his former fellows do not harry him to death, as abnormal members of the swarm or hive or herd or pack are harried to death by the rank and file in the static social life of gregarious animals or insects. This is the penalty of the genius whose failure to transform his social milieu convicts him of having been 'before his time'. On the other hand, if our genius does succeed in overcoming the passive inertia or active hostility of his former fellows and does triumphantly transform the social milieu which has hitherto been common ground between him and them into a new order in harmony with his transfigured self, he thereby makes life impossible for men and women of common clay unless they can succeed in adapting their own selves, in turn, to the new social milieu that has now been imposed upon them by the triumphant genius's masterfully creative will.

This is the meaning of a saying attributed to Jesus in the Gospels:

'Think not that I am come to send peace on Earth: I came not to send peace but a sword.

'For I am come to set a man at variance against his father, and the daughter against her mother, and the daughter-in-law against her mother-in-law.

'And a man's foes shall be they of his own household.'¹

The emergence of a superman or a great mystic or a genius or a superior personality inevitably precipitates a social conflict. The conflict will be more or less acute, according to the degree in which the creative individual happens to rise above the average level of his former kin and kind. But some conflict is inevitable, since the social equilibrium which the genius has upset by the mere fact of his personal emergence has eventually to be restored either by his social triumph or by his social defeat.

'A work of genius, which begins by being disconcerting, may by its mere presence create, bit by bit, a conception of art and an artistic atmosphere which will permit of its being understood. It will then receive the hall-mark of genius retrospectively. Failing that, it would have remained what it was at the beginning: that is, simply disconcerting. In a financial speculation, it is success that decides that the idea has been a good one. There is something of the same sort in the case of artistic creation, with this difference that here the success, if it eventually comes to the work which has shocked people at first, is the

¹ Matthew x. 34-6. Compare Luke xii. 51-3.

effect of a transformation in public taste which has been produced by the work itself. On this showing, the work has been a force as well as a material object. It has communicated the impress of an *élan* which the artist has imparted to it, or, rather, which is the artist's own *élan*, invisibly present in it. . . . It is only the thrust of genius that has ever forced the inertia of Humanity to yield.¹

How is it possible for social equilibrium to be restored when once the discordant, disturbing thrust of genius has made itself felt?

The simplest solution would be that uniform thrusts—uniform in vigour and uniform in direction—should be made by each and every individual member of Society simultaneously. In that event, no strain or tension or disturbance of equilibrium would be felt on the common ground of the individuals' respective fields of action, because all the individuals, in seeking to adapt their respective fields to the uniform mutations that had occurred simultaneously in their inner selves, would be feeling their way towards uniform adaptations. This easy solution, however, is only a fanciful conceit; for, *ex hypothesi*, a creative mutation of Human Nature is the act of an individual soul which is acting independently; and a simultaneous uniform mutation in every one of a number of individual human beings would be a sheer miracle.

There are not, of course, any authentic instances of this convenient miracle in human history. The most that we find is that the same—or more or less the same—creative thought or plan occurs, at approximately the same time and place, to two or three individuals instead of occurring exclusively to one.

In the history of our modern Western mechanical inventions, for example, the steam-engine and the locomotive and the aeroplane and the tank were invented at almost the same moment by several people. Indeed, the highly involved and long-drawn-out dispute between the several claimants of the reward which was offered for the invention of the tank by His Britannic Majesty's Government in the United Kingdom illustrates the difficulty of tracing an invention indisputably to a single author even when the invention in question is only a few years old, and when the society in which it has been made is in the habit of keeping exact and voluminous records of its transactions. And whatever the upshot of this British controversy may be—whether the invention of tanks in Great Britain was really singular or plural—it seems to be admitted that 'the ideas which had been thought out by the British originators in 1914 were reinvented separately and independently by the French

¹ Bergson, *op. cit.*, pp. 74 and 181.

in 1915'.¹ Similarly, in the history of modern Western mountaineering and exploration, there was actually a race between different parties to scale the Matterhorn² and to reach the North and South Poles;³ and in the history of modern Western Physical Science it was for a time an open question whether the concept of Evolution would receive its classical expression—'the struggle for existence' and 'the survival of the fittest'—from the mind of Charles Darwin or from the mind of Alfred Russel Wallace, while the abstruse calculations which led to the discovery of the planet Neptune—on the slender clue of certain unexplained irregularities in the motion of the planet Uranus—were actually worked out independently and simultaneously by Adams and Leverrier. This phenomenon of simultaneous pluralistic creation is particularly conspicuous in the histories of religions. The feat of providing the Arabian external proletariat of the Roman Empire with a vernacular version of the monotheism which had come to prevail in the Roman World was being attempted by Muhammad's contemporary Maslamah in the Najd at the very time when it was being accomplished, in the Hijāz, by Muhammad himself;⁴ and this simultaneous appearance of Muhammad and Maslamah in Arabia has parallels in the contemporaneity of Jesus and John the Baptist in Jewry, and in the encounter between Paul and Apollōs in the Hellenic mission-field of Primitive Christianity,⁵ and in the simultaneous appearance, in different parts of Western Christendom, of the Protestant Reformers: a Wyclif and a Huss in one generation and a Calvin and a Zwingli and a Luther in another.

The phenomenon of which these are a few familiar examples is described in the popular phrase that this or that new thing 'is in the air'; and there is nothing surprising about it. When we consider that a number of human beings who are in social relations with one another share more or less the same social background and social heritage and are exposed to more or less the same social challenges, it would rather be surprising if more or less the same response were never hit upon by several people at once. And the really surprising point in the actual operation of social dynamics is that a new thing 'in the air' should not be breathed in as a matter of course by

Swinton, Major-General Sir E. D.: *Eyewitness* (London 1932, Hodder and Stoughton).

² In the year 1865, the summit of the Matterhorn was reached for the first time by a party ascending from the Swiss side and by a party ascending from the Italian side within three days of one another—the two parties working quite independently.

³ The South Pole was reached independently by Amundsen on the 14th December, 1911, and by Scott on the 18th January, 1912. Peary's claim to have been the first human being to reach the North Pole—a feat which he achieved on the 6th–7th April, 1909—was disputed (though not convincingly) by Cook.

⁴ For Muhammad's career, see further III. C (ii) (b), pp. 276–8, with Annex II, below.

⁵ Acts xviii. 24–8, and xix. 1–7; 1 Corinthians i. 10–16, and iii, *passim*.

everybody. This, however, is not what happens in fact; for while it is true that a new creative thought or plan does often occur to more than one member of a society simultaneously, it is also true that it never occurs simultaneously to more than a minority.

The importance of such creative minorities in human history has struck the imagination of Mr. H. G. Wells:

'I am building my expectation of a new phase in human affairs upon the belief that there is a profoundly serious minority in the mass of our generally indifferent species. I cannot understand the existence of any of the great religions, I cannot explain any fine and grave constructive process in history, unless there is such a serious minority amidst our confusions. They are the Salt of the Earth, these people capable of devotion and of living lives for remote and mighty ends.'¹

In this passage, the fact on which emphasis is laid is not that these creative personalities are more than one in number, but that they are fewer—and far fewer—than the total membership of the societies in which they succeed in producing such dynamic social effects. And indeed this is the aspect of the situation which will make the strongest impression on us if we survey those contemporary instances of the phenomenon in the political sphere which the English writer of this passage had in mind: the Japanese Samurai, the Russian Communists, the Italian Fascisti.

The truth seems to be that the intrinsic uniqueness and individuality of any act of creation is never counteracted to more than a trifling extent by the tendency towards uniformity which arises from the fact that every individual member of Society is a potential creator and that all these individuals are living in the same social atmosphere; so that the creator, when he arises, always finds himself overwhelmingly outnumbered by the inert uncreative mass of his kin and kind, even when he has the good fortune to enjoy the companionship of a few kindred spirits. In all acts of social creation the creators are either creative individuals or, at most, creative minorities; and, at each successive advance which these pioneers of growing civilizations achieve, the great majority of the members of the society are left behind.

If we take, for example, the growth of the Hellenic Civilization between its infancy, as portrayed in the Homeric Epic, and its acme, which was attained in Athens during the half-century immediately preceding the catastrophe of 431 B.C., we notice at once that almost all the women have been left behind and almost all the slaves. The Homeric Odysseus has blossomed into the Attic Themistocles; but as for the Homeric Penelope and the Homeric Eumaeus, where, in fifth-century Athens, are they? We shall not rediscover Penelope

¹ Wells, H. G.: *Democracy under Revision* (London 1927, Hogarth Press), p. 42.

in the virtuous but colourless housewife of Xenophon's *Oeconomicus*,¹ nor Eumaeus in the Aristophanic slave who culminates in the sharp and shady Carion of the *Phutus*.² The creative minority in Periclean Athens is exclusively free-born and exclusively male; and, even so, it is only a small fraction of the free male population of Attica that has any part or lot in it.

We shall find the same situation if we take a glance at any or all of the five civilizations—the Western and the Orthodox Christian and the Islamic and the Hindu and the Far Eastern—that happen to be alive in our own day. The differentiation is perhaps most conspicuous in Hinduism, where the whole gamut of known human standards, from the lowest to the highest, is represented in the gradations that extend from the Ghonds and Bhils and Criminal Castes and 'Untouchables' and 'Depressed Classes' at one end of the scale to a Tagore or a Bhowe or a Gandhi at the other. On Western tongues, it is a common reproach to Hinduism to point out that it may stand for anything, from the loftiest moral and intellectual level to the most degraded; and the abandonment of the Hindu masses to their degradation is the central point in Miss Katherine Mayo's indictment of the Hindu *élite*.³ It is interesting to observe that the Hindu apologia has followed both of two mutually contradictory lines. Some of the Hindu apologists prefer to glory in their infirmities⁴ and claim for Hinduism, as its peculiar merit, that it translates into action, in everyday life, the Latin tag *Homo sum, humanum nihil a me alienum puto*.⁵ At the same time, other Hindu apologists pass over into a counter-offensive on the

¹ Milesian Aspasia is, of course, the exception which proves the Attic rule that is exemplified by the housewife in the *Oeconomicus* (an early fourth-century portrait which is equally true to life in the fifth century).

² In Carion, the lineaments of the typical slave of the Attic 'New Comedy' are already manifest.

³ Mayo, K.: *Mother India* (London 1927, Cape). Between the moment when the writer of this Study wrote these lines and the day when he first re-read them, a conference between the leaders of the Caste Hindus and the leaders of the 'Untouchables' had issued in the Poona Agreement of the 24th September, 1932. On the morrow of this agreement, in which the Caste Hindus undertook to give the 'Untouchables' a fair share in the political power which was on the point of devolving upon the Hindu community as a whole through the transfer of political authority in India from British to Indian hands, it looked as if this enfranchisement of the 'Untouchables' on the political plane might lead on to the removal, or at any rate the alleviation, of their social disabilities, to which they had been subject from time immemorial. If that sequel did follow, it would stamp the Poona Agreement of the 24th September, 1932, as the most signal event that had occurred in the history of Hinduism for many centuries. It is noteworthy that the achievement of the Poona Agreement was directly due to the personality of the Mahatma Gandhi, who had announced his intention of fasting to death unless the Caste Hindus and the 'Untouchables' were able to agree upon some alternative to the British Government's scheme for the political enfranchisement of the 'Untouchables'—a scheme which, in Mr. Gandhi's opinion, would have had the effect of stereotyping the ancient unhappy cleavage within the bosom of the Hindu community. The Poona Agreement—which may perhaps take rank, in retrospect, as the greatest triumph in Mr. Gandhi's career—may prove to be one recent example of a saint's power of transforming his social milieu into conformity with the creative evolution in himself.

⁴ 2 Corinthians xi. 30, and xii. 9.

⁵ Terence: *Hauton Timorumenus*, i, 1, l. 25.

lines of the Parable of the Mote and Beam. Instead of directly defending themselves, they seek to confound their Western critics by pointing out, in their turn, that the differentiation of cultural levels between one class and another, which shocks a Western observer when he contemplates the structure of the Hindu Society, stares us Westerners in the face in the present aspect of our own Western World.

Our Western scientific knowledge of which we boast, and even our Western technique for turning this knowledge to practical account—a technique on which we depend for the maintenance of our wealth and strength—is perilously esoteric. The great new social forces of Democracy and Industrialism, which our Western Civilization has thrown up in the course of its growth, have been evoked from the depths by a tiny creative minority. Even this minority is wondering to-day whether it will be able to control and guide much longer these forces that it has let loose—as witness Sir Alfred Ewing's presidential address to the British Association in 1932.¹ And the main reason why this would-be Western Salt of the Earth is in fear, to-day, of losing its savour is because the great mass of the Western body social has remained unsalted.

To-day this great mass of humanity still remains on substantially the same intellectual and moral level on which it lay—a century ago, or a century and a half—before the titanic new social forces began to emerge. The measure of this intellectual and moral retardation or stagnation or degradation of the mass is given with remorseless accuracy by the character of 'the Yellow Press'. In the latter-day perversion of our Western Press, we see the 'drive' of Western Industrialism and Democracy being employed to keep the mass of Western Humanity culturally depressed at, or perhaps even below, its pre-industrial and pre-democratic spiritual level; and the same new 'drive' has been put, with similar evil consequences, into the old institutions of War and Tribalism and Slavery and Property.² The creative minority in the modern Western World is in danger of seeing its advance brought to a standstill and the ground that it has conquered filched away by an act of betrayal that has prostituted the new-won powers and the new-made apparatus of this handful of pioneers to the anti-social function of debauching the rest of Society. This betrayal is a dastardly crime; and yet, in exposing it, we have not really probed to the bottom of the mischief. For the life of the many could never have been debauched so effectively by adroitly misapplying the inventions of the few if the many had not remained morally and intellectually stationary all

¹ See the passages quoted from this address in III. C (i) (d), p. 211, above.

² See III. C (i) (d), p. 212, above, and IV. C (iii) (b) 2-7, vol. iv, pp. 137-98, below.

the time while the few were making their tremendous moral and intellectual advance. This stagnation of the masses is the fundamental cause of the crisis with which our Western Civilization is confronted in our day. And the intensity of this crisis seems to bear out the Hindu controversialist's contention that the blemish which the Western observer perceives in the social structure of Hinduism is not peculiar to the Hindu Society, but is likewise discernible in the contemporary Western World.¹ This common predicament of two living societies may be regarded as a regular phenomenon in the life of all civilizations that are, or at any time have been, in process of growth.

The very fact that the growths of civilizations are the work of creative individuals or creative minorities carries the implication that the uncreative majority will be left behind unless the pioneers can contrive some means of carrying this sluggish rear-guard along with them in their eager advance. And this consideration requires us to qualify the definition of the difference between civilizations and primitive societies on which we have hitherto worked. At an earlier point in this Study,² we found that the primitive societies, as we know them, are in a static condition, whereas the civilizations—or, at any rate, the growing civilizations—are in dynamic movement. We should now rather say that growing civilizations differ from static primitive societies in virtue of the dynamic movement, in their bodies social, of creative individual personalities; and we should add that these creative personalities, at their greatest numerical strength, never amount to more than a small minority in the society which their action pervades and animates. In every growing civilization, even at the times when it is growing the most

¹ In estimating our Western Society's prospects of surmounting this crisis, we may perhaps venture to encourage ourselves by recalling certain instances in our own past history in which a gulf that had opened between an advancing minority and a lagging majority was after all successfully closed by bringing the majority into line. A noteworthy instance presents itself in the history of Parliamentary government in England. The successful establishment of responsible parliamentary government as a result of 'the Glorious Revolution' of A.D. 1688 was followed by a *de facto* limitation of the exercise of political power through this new constitutional channel to an oligarchy which represented a much smaller fraction of the total population of the country than the class which had effectively enjoyed the franchise in previous chapters of parliamentary history, when the control of Parliament over the Government had been imperfect or negligible. Moreover, this oligarchy succeeded in maintaining its virtual monopoly for nearly a century and a half—from A.D. 1688 to A.D. 1832—with the result that the mass of the population was practically disfranchised and the new system of government threatened to lose its vitality. Yet, even thus late in the day, it proved not impossible to bring the rear-guard into line with the van-guard; and in the course of the century beginning in A.D. 1832 successive extensions of the franchise have enabled almost the whole adult population to participate in the political life which the Whig oligarchs won for themselves in A.D. 1688. Similarly, the social gulf which opened, in an earlier chapter of English history, between the thegns, who had played the leading part in beating off the Vikings, and the militarily subordinate rank and file of the freemen, was successfully closed again without the permanent establishment of a rigid caste-system. (See II. D (v), vol. ii, p. 200, and III. C (i) (d), vol. iii, pp. 196 and 215-16, above.) These historical precedents may serve to put us in better heart to-day.

² In Part II. B, vol. i, pp. 192-5.

lustily, the great majority of the participant individuals are in the same stagnant quiescent condition as the members of a primitive society which is in a state of rest. More than that, the great majority of the participants in any civilization in any phase are men of like passions—of identical human nature—with Primitive Mankind.

'The truth is that, if Civilization has profoundly modified Man, it has done so by making the social milieu into a kind of reservoir for accumulating habits and skills which are poured into the individual by Society in each successive generation. Scratch the surface and efface what we receive from an education which never ceases, and we shall rediscover something very like primitive humanity in the depths of our nature. . . . Human Nature is the same to-day as it always has been.'¹

It will be seen that, although the difference between static primitive societies and growing civilizations is traceable to a difference in nature between two types of individual which are respectively characteristic of the two species of society, the individual participants in societies of the higher species do not conform exclusively, or indeed predominantly, to the type of individual which is characteristic of this species of society. The characteristic type of individual whose action turns a primitive society into a civilization and causes a growing civilization to grow is the 'superior personality' or 'genius' or 'great mystic' or 'superman'; but in any growing society at any given moment the individuals of this type are always in a minority. They are no more than a leaven in a lump of ordinary humanity; and this ordinary humanity is no different in nature from the human type which is typical of primitive societies.

Thus the line of spiritual demarcation between superior personalities and ordinary human beings does not coincide with the line of social demarcation between civilizations and primitive societies. There is an overwhelming majority of ordinary people in the membership of even the most advanced and progressive civilization; and the humanity of all these people is virtually primitive humanity.

'Those beliefs and customs of Savage Man are "primitive" which are the product of that "primitive" type of mind, or of non-primitive mind

¹ Bergson, *op. cit.*, pp. 133 and 169. See further pp. 106-7 and 150-70 for the author's whole argument against the thesis that primitive Human Nature in primitive societies differs in kind from ordinary Human Nature in the societies that are in process of civilization. The great French philosopher's opinion on this question is shared by a great English anthropologist: 'The truth seems to be that to this day the peasant remains a pagan and savage at heart; his civilization is merely a thin veneer which the hard knocks of Life soon abrade, exposing the solid core of paganism and savagery below.' (Frazer, Sir J. G.: *The Golden Bough*, 3rd ed., Part VII: 'Balder the Beautiful' (London 1913, Macmillan), Preface, pp. viii-ix. Cp. Meyer, E.: *Geschichte des Altertums*, vol. i (i), 4th ed. (Stuttgart and Berlin 1921, Cotta), p. 145.)

which from some cause or other keeps the co-ordinative reasoning controlling power in abeyance. That man is "primitive", whether he is a Veddah of Ceylon or a European peasant, whose ideas and practices are of that character.¹

Conversely, we have no warrant for assuming that the Arcadian village or the Ethiopian kraal or even the most backward and stagnant primitive society is destitute of superior personalities *in posse*²—individuals who have lived and died obscure because they have failed to break 'the cake of custom' and have therefore failed to win for their potential genius the field which it needs in order to realize and manifest itself in action.

Along the cool sequester'd Vale of Life
They kept the noiseless tenour of their way.

We are still left at grips with the problem of how those dynamic personalities who do succeed in breaking 'the cake of custom' in their own *for intérieur* are actually able to consolidate their individual victory, and save it from being converted into a social defeat, by going on to break 'the cake of custom' in their social milieu and so drawing all men unto them. In order to solve this problem,

'a double effort is demanded: an effort on the part of some people to make a new invention, and an effort on the part of all the rest to adopt it and adapt themselves to it. A society can be called a civilization as soon as these acts of initiative and this attitude of docility are both found in it together. As a matter of fact, the second condition is more difficult to secure than the first. The indispensable factor which has not been at the command of the uncivilized societies is, in all probability, not the superior personality (there seems no reason why Nature should not have had a certain number of these felicitous vagaries at all times and places). The missing factor is more likely to have been the opportunity for individuals of this stamp to display their superiority and the disposition in other individuals to follow their lead.'³

This problem of securing that the uncreative majority shall in

¹ Murphy, J.: *Primitive Man: His Essential Quest* (London 1927, Milford), p. 10.

² 'Le génie est répandu sur le genre humain à peu près comme l'or dans une mine. Plus vous prenez de minéral, plus vous recueillez de métal. Plus il y aura d'hommes et plus vous aurez de grands hommes ou d'hommes propres à devenir grands. Les hasards de l'éducation et ceux des événements les développent ou les laissent enfouis dans l'obscurité. . . . On est forcé d'avouer que si Corneille, élevé dans un village, eût mené la charrue toute sa vie, que si Racine fût né au Canada chez les Hurons . . . ils n'eussent jamais déployé leur génie.'—Plan de Deux Discours sur l'Histoire Universelle' in *Œuvres de Turgot*, nouvelle édition (Paris 1844, Guillaumin, 2 vols.), vol. ii, pp. 645-6.

³ Bergson, *op. cit.*, p. 181. Compare the following passage of Plato (in *Laws*, 951 B-C): 'Among the mass of Mankind there is always a certain number—though a very small number—of godlike individuals whose inspiration is of priceless social value. These rare individuals are no more apt to emerge in socially progressive societies than in others; so the members of the socially progressive societies ought to be constantly on their tracks, scouring sea and land in order to discover sterling representatives of the species [and to derive from them inspiration for] revising the existing body of social institutions.'

fact follow the creative minority's lead appears to have two solutions, the one practical and the other ideal.

'How is one to get purchase upon the will [of another person]? There are two ways open to the educator. The one way is by drill (*dressage*) . . . the other is by mysticism. . . . The first method inculcates a morality consisting of impersonal habits; the second induces the imitation of another personality, and even a spiritual union, a more or less complete identification, with it.'¹

The classic description of this second, mystical method is given in Plato's indignant refusal of Dionysius's request for a short and simple exposition of the Platonic philosophy in writing.

'I have one thing to say about all writers, past or future, who claim to understand my philosophy either as a result of oral communications received from me or from others or by the unaided light of their own genius. All such claimants stand convicted of charlatanism on my showing. At any rate there is no written work of my own on my philosophy, and there never will be. For this philosophy cannot possibly be put into words as other sciences can. The sole way of acquiring it is by strenuous intellectual communion and intimate personal intercourse, which kindle it in the soul instantaneously like a light caught from a leaping flame; and, once alight, it feeds its own flame thenceforward. Of course I know very well that the best presentation of it, oral or written, would be my own. I also know that I should be the first to be pained by a written presentation which failed to do it justice. And if I believed that an adequate popular presentation, either written or verbal, were possible, what finer life-work could I have set myself than to write something of real benefit for Mankind; something which would bring the nature of the Universe into the light of day for all eyes to see? Unhappily, I do not consider that the study of my philosophy is good for people, with the exception of a few who are capable of discovering it for themselves with the aid of a minimum of demonstration. As for the rest, I fancy that some would be filled perversely with a misguided contempt and others with a soaring, windy expectation—in the belief that they had learnt something tremendous.'²

The direct kindling of creative energy from soul to soul, which Plato here enjoins, is no doubt the ideal way. Yet to enjoin this way exclusively is a counsel of perfection. The problem of bringing the uncreative rank and file of a growing society into line with the creative pioneers, in order to save the pioneers' own advance from being brought to a halt, cannot be solved in practice, on the social scale, without also bringing into play the faculty of sheer mimesis—one of the less exalted faculties of Human Nature which has more in it of drill than of inspiration.

To bring mimesis into play is indispensable for the purpose in

¹ Bergson, *op. cit.*, pp. 98-9.

² Plato's Letters, No. 7, 341 B-E.

246 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
hand because mimesis, at any rate, is one of the regular faculties of ordinary Primitive Man.

'The original drill, the drill that has been intended by Nature, consists in the adoption of the habits of the group; it is automatic; and it is performed spontaneously in situations where the individual feels himself half merged in the collective life.'

Thus, when the Promethean *élan* summons mimesis to its aid in order to express itself in the growths of civilizations through the action of creative individuals or creative minorities, it is not called upon to perform the *tour de force* of evoking, in the other individuals who constitute the uncreative majority, some new faculty which has hitherto been alien from their nature. Creative Evolution has set herself here the easier task of utilizing an existing faculty for the performance of a new function by merely giving the faculty a new orientation; and this historic reorientation of an intrinsically unaltered faculty of mimesis has engaged our attention already in our first inquiry into the specific difference between primitive societies and civilizations. We have noticed already that mimesis is a generic feature of social life and that its operation can be observed in societies of both species. But we have also noticed in the same context that while, in primitive societies, mimesis is directed towards the older generation of the living members and towards the dead ancestors, in whom 'the cake of custom' is incarnated, the mimetic faculty is reoriented, in societies in process of civilization, towards creative personalities who have broken new ground.² The 'elements' of the old faculty 'persist; but they have been magnetized and have been turned by this magnetization in a new direction'.³

Can this revised version of a primitive social drill—this perfunctory and almost automatic right or left incline—really serve as an effective substitute for the 'strenuous intellectual communion and intimate personal intercourse' which Plato declares to be the sole way in which the spark of creative energy can be genuinely transmitted?⁴ It can only be replied that the inertia of Mankind

¹ Bergson, *op. cit.*, p. 99. This metaphor of 'drill' is also employed by Bagehot, W., in *Physics and Politics*, 10th ed. (London 1894, Kegan Paul), p. 27.

² See Part II, B, vol. i, pp. 191-2, above.

³ Bergson, *op. cit.*, p. 230. 'This is the principal mode in which the greatest minds of an age produce their effect. They set the tone which others take, and the fashion which others use. There is an odd idea that those who take what is called a "scientific view" of history need rate lightly the influence of individual character. It would be as reasonable to say that those who take a scientific view of Nature need think little of the influence of the Sun. On the scientific view a great man is a great new cause.' (Bagehot, W.: *Physics and Politics*, 10th ed. (London 1894, Kegan Paul), pp. 96-7.)

⁴ This question is raised by de Gobineau: 'L'imitation n'indique pas nécessairement une rupture sérieuse avec les tendances héréditaires, et l'on n'est vraiment entré dans le sein d'une civilisation que lorsqu'on se trouve en état d'y progresser soi-même, par soi-même et sans guide.' (*Essai sur l'Inégalité des Races Humaines* (Paris 1853-5, Firmin-Didot, 4 vols.), vol. i, p. 122.)

in the mass has never in fact been overcome by the exclusive use of the Platonic method; and that, in order to draw the inert majority along in the active minority's train, the ideal method of direct individual inspiration has always had to be reinforced by the practical method of wholesale social drill—a habitual exercise of Primitive Mankind which can be made to serve the cause of social progress when new leaders take command and issue new marching orders.

The creative personality who makes play with the primitive habit of mimesis in order to move a mass of ordinary people on whom he has no hope of getting purchase in any other way is in much the same quandary as a chauffeur who turns and turns his crank on the chance that the engine may start up in the end if only he persists. The chauffeur resorts to this primitive donkey-work because experience has taught him that these apparently 'vain repetitions'¹ are actually capable of striking the essential spark which he has failed to conjure up with his 'self-starter'. A similar capacity is latent in the apparently perfunctory and automatic spiritual motions of mimesis.

'Formulae that are almost void of meaning have a way of evoking here and there, like veritable magic phrases, the spirit that can fulfil them. A mediocre teacher, giving mechanical instruction in a science that has been created by men of genius, may awake in some one of his pupils the vocation which he has never felt in himself, and may convert him all unconsciously into an emulator of those great men whose personalities are invisibly present in the message which our teacher transmits.'²

It is this mysterious possibility of kindling fire by rubbing dry sticks that invites, and justifies, the play which is made with mimesis in those relations between creative minorities and inert majorities that bring about the growths of civilizations. Mimesis, as we have seen,³ may lead to the acquisition of social 'assets'—aptitudes or emotions or ideas—which the acquirers had not originated for themselves and which they might never have possessed if they had not encountered and imitated other people in whose possession these assets were already to be found. This, of course, is as much as to say that mimesis is a 'short cut'; and, at a later point in this Study,⁴ we shall find that this 'short cut', though it may be an inevitable path

¹ Matt. vi. 7.

² Bergson, *op. cit.*, pp. 229-30. Compare p. 47, *ad init.* An historic social illustration of Bergson's point is offered, in the sphere of Art, by the extraordinary yet well-established fact that the sublime and vital and creative art of Mahayanian Buddhism was actually kindled into flame by the spark of divine fire which was invisibly present in the mediocre works on Hellenic art—produced mechanically on standardized patterns for commercial profit—which were current in the Oxus-Jaxartes Basin and North-Eastern Iran and the Panjab round about the beginning of the Christian Era.

³ In Part II. B, vol. i, p. 191, above.

⁴ In IV. C (iii) (a), vol. iv, pp. 123-31, below.

248 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
towards a necessary goal, is also a dubious expedient which no less inevitably exposes a growing civilization to the peril of breakdown. It would be premature, however, to discuss that peril in this place. For, now that we have come to the end of our inquiry into the relation between growing civilizations and individuals, we have next to inquire into the interaction between individuals in growing civilizations.

(b) THE INTERACTION BETWEEN INDIVIDUALS IN GROWING
CIVILIZATIONS

The Movement of Withdrawal-and-Return

In the last chapter we have studied the course which is followed by creative personalities when they are taking the mystic path which is their highest spiritual level. We have watched the mystic's soul passing first out of action into ecstasy and then out of ecstasy into action again.¹ In this language, we have been describing the creative movement in terms of the personality's inward psychic experience. In terms of his external relations with other individual human beings in the social life which is the common ground of his and their respective individual fields of action, we shall be describing the same movement if we call it a disengagement and temporary withdrawal of the creative personality from his social milieu, and his subsequent return to the same milieu transfigured: in a new capacity and with new powers. The disengagement and withdrawal make it possible for the personality to realize individual potentialities which might have remained in abeyance if the individual in whom they were immanent had not been released for a moment from his social toils and trammels. The withdrawal is an opportunity, and perhaps a necessary condition, for the anchorite's transfiguration; but, by the same token, this transfiguration can have no purpose, and perhaps even no meaning,² except as a prelude to the return of the transfigured personality into the social milieu out of which he has originally come: a native environment from which the human social animal cannot permanently estrange himself without repudiating his humanity and becoming 'either a beast or a god'.³ The return is the essence of the whole movement, as well as its final cause.

¹ See the passage quoted from Bergson on pp. 234-5, above.

² The transfiguration of a creative personality is a change in his aspect which, *ex hypothesi*, is perceived in him by fellow human beings; and it can only be perceived by men and women who have associated with him after, as well as before, he has enjoyed the personal spiritual experience of which his transfigured countenance is the outward and visible sign. (See Exodus xxxiv. 29-35, for a description of such transfiguration in mythological imagery.)

³ Aristotle, *Politics*, i. 1, 9-12 (p. 1253 A), quoted in I. C (iii) (c), vol. i, on p. 173, above.

This is apparent in the Syriac myth of Moses' solitary ascent of Mount Sinai. Moses ascends the mountain in order to commune with Yahweh at Yahweh's call; and the call is to Moses alone, while the rest of the Children of Israel are charged to keep their distance and not to touch the mount, under pain of being blasted by a force which only Moses can confront unscathed. Yet Yahweh's whole purpose in calling Moses up is to send him down again as the bearer of a new law which Moses is to communicate to the rest of the people because they are incapable of coming up to receive the communication themselves.

'And Moses went up unto God; and the Lord called unto him out of the mountain, saying: "Thus shalt thou say to the house of Jacob and tell the Children of Israel. . . ."

'And he gave unto Moses, when he had made an end of communing with him upon Mount Sinai, two tables of testimony . . . written with the finger of God.'¹

The emphasis upon the return is equally strong in the account of the prophetic experience and the prophetic mission which is given by the Arabic philosopher Ibn Khaldūn.

'The human soul has an innate disposition to divest itself of its human nature in order to clothe itself in the nature of the angels and to become an angel in reality for a single instant of time—a moment which comes and goes as swiftly as the flicker of an eye-lid. Thereupon, the soul resumes its human nature, after having received, in the world of angels, a message which it has to carry to its own human kind. This is the meaning of the terms Revelation and Discourse of Angels.'²

In this philosophic interpretation of the Islamic doctrine of prophecy we seem to catch an echo of a famous passage of Hellenic philosophy: the Platonic simile of the Cave.³

"And now," he said . . . , "Picture to yourself people in a kind of cave-like underground dwelling. The place has its entrance open to the light, and this entrance stretches along the whole length of the cave. Picture these people living in this place from their infancy with their limbs fettered and likewise their necks, so that they cannot change their position and can only see in front of them, because the fetters make it impossible for them to turn their heads. And then imagine fire-light coming to them, from behind their backs, from a fire which is burning at a higher level and at a long distance off, with a raised road running between this fire and the prisoners. And now picture a parapet built along the side of the road, like the screens in front of the performers in a Punch and Judy show—the screens over the top of which they display their puppets."

¹ Exodus xix. 3, and xxxi. 18. See chapter xix, *passim*.

² Ibn Khaldūn: *Muqaddamāt*, French translation by Baron M. de Slane (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. ii, p. 437.

³ Plato, *Republic*, 514 A-521 C.

"I see the picture," he said.

"Well, now imagine people carrying past this parapet all kinds of material objects which show up over the top of it—particularly models of living creatures: figures of human beings and figures of animals made of stone and of wood and of all kinds of materials. And imagine that some of the people will be talking—as they naturally will—and others keeping silence as they carry the objects by."

"A strange simile," he said, "and strange prisoners!"¹

"The prisoners are ourselves," said I.

The prisoners, of course, take it for granted that the moving shadows cast by the fire-light upon the back wall of the cave are the ultimate realities, since these are the only realities that they have ever been able to see. They cannot guess that these are mere shadows of solid objects that are in motion, outside the cave, behind the prisoners' backs; or that these objects themselves are only inanimate models of living beings—models whose motions are imparted to them by genuine living agents whose very shadows are intercepted by the parapet and therefore never appear on the cave-wall screen. When the voices of the passengers on the road actually penetrate the cave and echo from the wall on which the moving shadows of their burdens are cast, the prisoners imagine—inevitably—that the voices are being emitted by the shadows of the objects that are being carried by the speakers, and never suspect the existence of the speakers themselves. This fantasy is presented by Plato as an apt simile for the ordinary state of ordinary people in the ordinary world.

Plato then imagines a prisoner being suddenly released from his fetters and compelled to stand up and turn his head and walk and face the light and finally come out into the open. The first result of this sudden compulsory reorientation of vision is that the liberated prisoner is dazzled and confused. He finds himself in an agonizing and incomprehensible blaze of light, and wishes himself back in the comfortable and familiar underground environment in which he has been brought up. But this is only the first effect of his translation from the fire-lit cave into the sun-lit upper world. The faculty of vision is already in him, and it only needs this drastic reorientation of direction and change of medium in order to accustom his eyes gradually to take in the real world, until at last he is able to look the Sun himself in the face. And when the

¹ The simile is more strange to a reader of Plato's generation in Plato's world than to one of our generation in ours; for Plato is really picturing, by a brilliant effort of imagination, the situation of an audience in a cinematograph theatre with its eyes glued to the screen on which a lantern at their backs projects the lights and shadows of a moving film. Plato even anticipates the distinction between silent films and 'talkies'. If Plato had happened to live in this Western World in this twentieth century, he would assuredly have taken the simile which he requires at this point in *The Republic* from real life, instead of resorting to an elaborate and inevitably somewhat bizarre fantasy.

liberated prisoner has thus adapted himself to living in sunlight and freedom completely, his previous condition is exactly inverted. If he is now suddenly compelled to turn his back on the light of day and go down into the cave again, he is just as much dazzled and confused by the twilight now as he was by the sunlight before. He experiences all the agonies and uncertainties of translation once again; and again he regrets, and now if possible still more poignantly, the environment which he is being compelled to leave. Moreover, this time his regrets are fully justified; for this time he is being compelled to leave a better world for a worse (as he knows now, for certain, through having had some experience of either); and, in returning to his old companions in the cave who have never yet seen the sunlight, he will be exposed to the risk of a hostile reception.

"There will assuredly be laughter at his expense, and it will be said of him that the only result of his escapade up there is that he has come back with his eye-sight ruined. Moral: it is a fool's game even to make the attempt to go up aloft; "and as for the busybody who goes in for all this liberating and translating to higher spheres, if ever we have a chance to catch him and kill him, we will certainly take it".

When Plato has painted the ordeal of the return in these unattractive colours, it is almost startling to find him imposing this ordeal remorselessly upon his elect philosophers. If it is essential to the Platonic system that the elect should acquire philosophy, it is equally essential that they should not remain philosophers only. The purpose and the meaning of their philosophic enlightenment is that they should ultimately become philosopher-kings.

"Our business," I said, "is to compel the most highly gifted individuals in our society to address themselves to the study which we have called the greatest study of all. We have to make them see the Good by ascending the ascent which we have pictured in our simile. But when they have duly ascended and seen their fill, then it becomes our business not to give them the licence which is actually given them nowadays."

"What licence?"

"The licence," I said, "of remaining up there and refusing to come down again to the prisoners who have remained in bondage—refusing to share, for better or for worse, in the trials and triumphs of that underworld. . . . We must say to them . . . : *You have each of you to come down again in your turn to the common dwelling-place of your kin and kind; and you have to accustom yourselves again to using your eyes in the dark. When you have recovered the habit, you will find yourselves infinitely sharper-sighted than the denizens of the underworld. You will know exactly what each of the shadows is, and what it is a shadow of, thanks to the vision which you have had of Reality in the several realms of Beauty and Justice and Goodness. And so our society—which is also*

your society—will be taught to live its life in the clear light of consciousness instead of having to live it in the nightmare in which most societies have been kept hitherto by people who have been fighting over shadows—struggling for power, as though power were a prize worth winning—while the actual truth is, and must be, that social life is happiest and most harmonious where those who have to rule are the last people who would choose to be rulers, and is least happy and least harmonious where the rulers are of the opposite disposition.”

The path which Plato here lays down for his philosopher-kings is unmistakably identical with the path that has been trodden by the Christian mystics.¹ The pain and bewilderment which the Platonic prisoner suffers for a time after he has been forced to come up out of the cave into the sunlight correspond to the raptures and hallucinations which are the prelude to the Christian mystic's transfiguration through his ecstatic union with God.² The still sharper pain and still deeper bewilderment which the liberated prisoner suffers when he is forced to re-descend into the chthonic 'prison-house' and feels its 'shades' beginning 'to close around' him³ correspond, in turn, to 'the dark night' through which the soul of the Christian mystic has to pass when it is returning from ecstasy into action. Yet, while the path is identical, the spirit in which it is traversed by the Hellenic and the Christian soul is not the same.

In the Simile of the Cave, it is taken for granted that the personal interest, as well as the personal desire, of the liberated and enlightened philosopher must be in opposition to the interest of the mass of his fellow men who still 'sit in darkness and in the shadow of death, . . . fast bound in misery and iron'.⁴ For these unliberated prisoners of the underworld, the crying need—though they themselves may be blind to it—is that the philosopher should return, 'trailing clouds of glory', 'from God who is' his 'home',⁵ like 'a day-spring from on high' to give them light: 'to give knowledge of salvation', and 'to guide' their 'feet into the way of peace'.⁶ On the other hand, the philosopher, on Plato's showing, cannot minister to these needs of Mankind without sacrificing his own happiness and his own perfection. For, when once he has attained enlightenment, the best thing for the philosopher himself, in Plato's own view, is to remain in the light and live happily there ever after.

¹ For a penetrating analysis and description, in small compass, of the Christian mystic experience, see Bergson, *Il.: Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 243-9. Portions of this passage have been quoted already in the present Study on pp. 234-5, above.

² For these raptures and hallucinations, see Bergson, *op. cit.*, p. 244.

³ William Wordsworth: *Ode on Intimations of Immortality from Recollections of Early Childhood*.

⁴ Psalm cviii. 10.

⁵ Wordsworth, *op. cit.*

⁶ Luke i. 77-9.

It was indeed a fundamental tenet of Hellenic Philosophy that the best state of life is the state of 'contemplation' (*θεωρία*): a philosophic term with a religious association¹ which pitches its meaning somewhere between 'intellectual speculation' and 'mystical ecstasy'. The life of contemplation is placed by Pythagoras above the life of action, as well as above the life of pleasure;² and this doctrine runs through the whole Hellenic philosophical tradition from Pythagoras to the Neoplatonists. It is accepted, explicitly or implicitly, by Plato himself in many places besides the passage here quoted; and in this passage, as we have seen, Plato assumes that nothing but compulsion will bring the philosopher down again to the underworld and back again to Mankind to perform the social task which his fellow men require of him. The compulsion which the Platonic philosophers obey when they become philosopher-kings may not be really external; but even if they are driven into action by a Spartan sense of duty rather than by a Median lash, they are being driven all the same; and, however admirably they may behave, they are handicapped by a fatal lack of zest which checks the impetus of their *élan*. This negative, weary, melancholy temper is manifest in the *Meditations* of Marcus Aurelius, the historic philosopher-king who dutifully carried on his shoulders the burden of governing the whole *Orbis Romanus*.

'Human life! Its duration is momentary, its substance in perpetual flux, its senses dim, its physical organism perishable, its consciousness a vortex, its destiny dark, its repute uncertain—in fact, the material element is a rolling stream, the spiritual element dreams and vapour, life a war and a sojourning in a far country, fame oblivion. What can see us through? One thing and one only—Philosophy; and that means keeping the spirit within us unspoiled and undishonoured . . . and taking what comes contentedly as all part of the process to which we owe our own being.'³

The state of mind of the historic philosopher-king which is revealed in this passage reflects upon the pious hope which is expressed by Plato at the close of his allegory. Plato affects to believe that his enlightened philosophers, when they receive their orders to return, will duly obey and duly consent to take a hand in the work of the World (on the understanding that they are to take it turn and turn about, so that they can spend the greater part of their time apart, in exclusive communion with one another, in a

¹ A *θεωρός* means, in the technical terminology of Hellenic public life, an ambassador from a city-state to the holy place of some Pan-Hellenic divinity: e.g. to the oracle of Apollo at Delphi.

² Burnet, J.: *Greek Philosophy: Thales to Plato* (London 1914, Macmillan), p. 42.

³ Marcus Aurelius Antoninus: *To Himself*, Bk. II, *ad fin.*

pure moral atmosphere and a clear intellectual daylight).¹ But while this Platonic Wisdom might be justified of her children² in the rare personality of a Marcus, who carried his heavy burden of social responsibility in the spirit of a conscientious sentry who would not desert his post,³ this was not the characteristic spirit of Hellenic philosophers and not their common practice; and the example of Marcus in the second century of the Roman Empire was not followed by Plotinus in the next century, when the breakdown of the Hellenic universal state was making the duty of returning to the World less attractive to Hellenic philosophers than ever. In Plotinus, both Hellenic Philosophy and Hellenic Mysticism reached their term; and Plotinus's repudiation of the Platonic injunction to return is taken by Bergson as a sign that the Hellenic form of Mysticism was incomplete.

'In our eyes, the culmination of Mysticism is an entry into contact, and in consequence a partial coincidence, with the creative effort that is manifested by Life. This effort comes from God, if it is not identical with God himself. The great mystic would be an individual who transcended the limits assigned to the Human Species by its materiality, and who thus continued and prolonged God's action. . . . To Plotinus . . . it was given to see the Promised Land, but not to set foot upon its soil. He went as far as Ecstasy: a state in which the Soul feels itself, or thinks that it feels itself, in the presence of God, with God's light illuminating it. But Plotinus did not transcend this last stage and so arrive at the point where contemplation plunges into action and the human will becomes merged in the divine will. Plotinus believed himself to be at the summit: to go further would have been, for him, to go downwards. And this is what he has expressed in language which is admirable in itself but which is not the language of Mysticism in its plenitude. "Action," he says, "is a weakened form of contemplation."⁴ Herein Plotinus remains faithful to the intellectualism of the Hellenic genius. In fact, he sums it up in a striking formula. . . . In a word, Mysticism, in the absolute sense in which we have decided to take the term, was never attained by Hellenic thought. No doubt Mysticism was seeking here for realization; and, as an unrealized possibility, it knocked several times on the door. The door actually opened to it wider and wider, but never wide enough to allow it to enter complete.'⁵

This ultimate refusal of the Hellenic philosophers to return from the world of contemplation into the world of action out of which they had originally come may explain why it was that the breakdown which the Hellenic Civilization had suffered in the generation

¹ Plato, *Republic*, 520 D.

² Matt. xi. 19; Luke vii. 35.

³ For this simile of the sentry see Plato, *Phaedo*, 62 B, where it is placed in Socrates' mouth.

⁴ 'Ἐπεὶ καὶ ἄνθρωποι, ὅταν ἀσθενήσωσιν εἰς τὸ θεωρεῖν, σκίαν θεωρίας καὶ λόγου τὴν πρᾶξιν ποιοῦνται. (Ennead III, viii, 4).

⁵ Bergson, *op. cit.*, pp. 235-6.

preceding Plato's generation was never retrieved. For here we see the same 'great refusal' that the creators of the Egyptiac Civilization made in the age of the Pyramid-Builders,¹ and that Zeus would have made at the dawn of Hellenic history if he had not been saved from it, in spite of himself, by Prometheus.² The reason why 'the great refusal' was made by the Hellenic philosophers is also clear. Their moral limitation was the consequence of an error in belief. Believing that the ecstasy and not the return was the be-all and end-all of the spiritual Odyssey on which they had embarked, they saw nothing but a sacrifice on the altar of duty in the painful passage from ecstasy to return which was really the purpose and meaning and culmination of the movement in which they were engaged. The supreme importance of this passage, which the Hellenic philosophers just failed to divine, is brought out in Bergson's penetrating account of the experience of the Christian mystics.

'If [in the mystic ecstasy] the Soul is absorbed into God in its thought and in its feeling, there is still some part of it that remains outside, and that is the will. Its action, if it acted, would still proceed simply from itself. Its life, therefore, is not yet divine. Of this it is aware; the knowledge causes it a vague disquietude; and this agitation in repose is characteristic of what we call complete Mysticism. It indicates that the *élan* has been acquired for the sake of going further; that, while the ecstasy certainly engages the perceptive and emotional faculties, there is also the will; and that the will, likewise, has to be restored to God. When this feeling has grown to the point of occupying the whole field of consciousness, the ecstasy has fallen away, the Soul finds itself alone again, and sometimes it is desolated by the experience. Accustomed as it has been for a time to dazzling light, it can no longer distinguish anything in the shade. It does not take account of the profound travail that is being accomplished in obscurity within. It feels that it has lost much; it does not yet know that it has suffered that loss in order to gain all. This is the "dark night" of which the great mystics speak, and it is perhaps the most significant, and in any case the most instructive, feature that the Christian Mysticism has to show. The definitive phase—the phase that is characteristic of the Great Mysticism—is at hand. . . . The soul has already felt God's presence; it has already believed itself to have perceived Him in symbolic visions; it has already even attained to union with Him in the ecstasy; but none of this has been lasting because it has all been nothing but contemplation: action has [always hitherto] recalled the Soul to itself and has thus detached it from God. [But] now it is God who is acting in the Soul and through it: the union is entire, and consequently definitive. . . . Now the visions are things of the past; for how could the Godhead manifest itself from outside to a Soul which is now and henceforward filled with the Godhead? There

¹ See III. C (i) (d), pp. 212-15, above.

² See III. B, above.

is nothing more now in the appearance of such a human being to indicate that there is any essential distinction between him and the other human beings among whom he moves. He alone is aware of a change which raises him to the rank of the *adjutores Dei* who are passive in their relation to God but active in their relation to Mankind."¹

This movement of Withdrawal-and-Return, which culminates in 'the dark night of the Soul' in the Christian mystical experience, is not a peculiarity of human life which is only to be observed in the relations of human beings with their fellows. It is something that is characteristic of Life in general; and it becomes manifest to Man in the life of the plants as soon as Man has made this plant-life his own concern by taking to agriculture. In the World of Vegetation the withdrawal and the return are enacted in the annual procession of the seasons. The corn withdraws in the autumn when the stubble wilts and the seed is sown in the bosom of the Earth; the buried seed undergoes its mystic unseen transfiguration in the winter; and the corn returns in the spring when the green blade rises out of the ground in order to ripen for a fresh harvest in the summer. This movement of Withdrawal-and-Return in the Vegetable Kingdom, which has entered into the economic life of Mankind in consequence of the invention of agriculture, pulsates through our human economic activity in all its post-agricultural transformations. Withdrawal-and-Return is the rhythm of the Nomad's annual trek on a recurrent orbit with his flocks and herds; and we bear testimony to the operation of the same *motif* in the rhythm of our own modern Western Industrialism when we talk of 'sinking' capital or of making 'a reproductive investment'.

The manifest parallelism between the life of plants and the life of men has led the human imagination to express its thoughts and feelings and hopes and fears about each of these two realms of life in terms of the other.

The Withdrawal-and-Return of the corn has been translated into anthropomorphic terms in ritual and mythology, as witness the rape and restoration of a Korê or Persephonê,² and the death and resurrection of a Dionysus or Adonis or Osiris or whatever may be the local name for the universal corn-spirit or *ἐνιαυτός δαίμων* whose ritual and myth are as ubiquitous as the art of agriculture itself. It is a frequent feature of the agrarian myth that the

¹ Bergson, *op. cit.*, pp. 246-8.

² If the mythical adventure of Persephonê represents the movement of Withdrawal-and-Return when it is carried to completion (as we have seen it carried in the experience of the Christian mystics), we may perhaps take the myth of Eurydicê as an allegory of the movement when it comes to a halt just short of the triumphant return (as we have seen it come to a halt in the experience of the Hellenic philosophers).

transfiguration which is accomplished during the period of withdrawal should likewise be translated into human terms by introducing a difference of personality and a diversity of sex. The springing corn is thus pictured as a male child who is born from the womb of the Earth Mother.

Conversely, the human imagination has found an allegory of human life in the phenomena of Withdrawal-and-Return which are apparent in the life of plants and trees and flowers; and in terms of this allegory it has wrestled with the problem of Death: a problem which begins to torment human minds from the moment when, in growing civilizations, the higher personalities, whose value and significance lie in their unique originality and therefore appear to be annihilated by their death, begin to disengage themselves from the mass of Mankind.

There is a passage in the Homeric Epic in which the poet's apprehension of the common lot of leaves and men casts a shadow over the husbandman's glad confidence in the return of spring—the shadow of the thought of the transitoriness of the lives of men:

Mark ye the leaves, for men are like thereto.
When leaves by winds into the dust are whirled
Soon the green forest buddeth millions new,
And lo, the beauty of Spring is on the World.
So come, so pass, all that are born of Man.¹

In the dirge for the Sicilian Greek poet Bion—an anonymous Greek poem of the third century B.C.—the annual reappearance of the plants and flowers is represented, in the antique vein of the agrarian ritual, as a happy resurrection, and not in the Homeric vein as a ruthless replacement of old life by new; but this is only to point a pathetic contrast between the resurrection of the flower and the last sleep of a man from which there is no waking.

Alas, when mallow in the garden dies,
Or parsley green, or crinkled anise dear,
They rise again, they bloom another year;
But we, great men, so powerful and so wise,
Once dead, beneath the hollow earth must keep
A long, dumb, changeless, unawakening sleep.²

In this passage from a poem of the Hellenic decline, the return of a human being to the society of his fellows, when once he has been withdrawn from the material world of men by the stroke of Death, is ruled out of the bounds of possibility. But there was a subterranean stream of Hellenic feeling and thought in which

¹ *Iliad*, vi, ll. 146-9, translated by Gilbert Murray.

² *Anonymi Epitaphios Bionis*, ll. 99-104, translated by Gilbert Murray.

258 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
the annual resurrection of the vegetation—represented anthropomorphically as the *ἐνταυτός δαίμων*—was taken as an earnest of immortality for individual human beings; and this underground spiritual current, which was the spirit of the Eleusinian and the Orphic mysteries, welled up to the surface of thought and belief in the allegorical imagery of Primitive Christianity.

‘Except a corn of wheat fall into the ground and die, it abideth alone; but if it die, it bringeth forth much fruit.’¹

The allegory suggested in this passage from the Gospel according to Saint John is introduced and followed out in an older document of the collection that constitutes the New Testament:

‘Some man will say: “How are the dead raised up? And with what body do they come?”

‘Thou fool, that which thou sowest is not quickened except it die;

‘And that which thou sowest, thou sowest not that body that shall be, but bare grain, it may chance of wheat or of some other grain;

‘But God giveth it a body as it hath pleased him, and to every seed his own body . . .

‘So also is the resurrection of the dead. It is sown in corruption, it is raised in incorruption;

‘It is sown in dishonour, it is raised in glory; it is sown in weakness, it is raised in power;

‘It is sown a natural body, it is raised a spiritual body . . .

‘And so it is written: “The first man Adam was made a living soul; the last Adam was made a quickening spirit.” . . .

‘The first man is of the earth, earthy; the second man is the Lord from Heaven.’²

In this passage from the First Epistle of Paul to the Corinthians, four ideas are presented in a succession which is also a crescendo. The first idea is that we are witnessing a resurrection when we behold the return of the corn in the spring after its withdrawal in the autumn. The passage thus begins by reaffirming the ancient faith in the resurrection of plants and flowers which had been enacted in the agrarian ritual and expressed in the agrarian myth, but which had been shaken in the soul of the Homeric poet by his dismay at the appalling human experience of Death. The second idea is that the resurrection of the corn is an earnest of the resurrection of dead human beings: a reaffirmation of a doctrine which the Hellenic Mysteries had taught and which a third-century Greek poet had sorrowfully abandoned. The third idea is that the resurrection of human beings is possible and conceivable in virtue of some kind of transfiguration which their natures undergo through the act of God during the time of waiting that has to intervene

¹ John xii. 24.

² 1 Corinthians xv. 35-8 and 42-5 and 47.

between their death and their return to life. The earnest of this hypothetical transfiguration of dead human beings—a hypothesis which has to be taken on faith—is the manifest transfiguration of seeds into flowers and fruits: a miracle which repeats itself year by year for every human eye to see. This parallel also foreshadows the quality of the transfiguration which human beings are to undergo. This change in human nature is to be a change in the direction of greater endurance, greater beauty, greater power, and greater spirituality; and this last term in the poetic imagery in which Paul describes the change reveals it as identical with the tendency which we have taken as our criterion of growth and which we have called 'etherialization'.¹ The fourth idea in the passage is the last and the most sublime. In the concept of the First and Second Man, the problem of Death is forgotten and the concern for the resurrection of the individual human being is momentarily transcended. In this climax of Paul's thought, the transfiguration of the seed into the fruit, which is apparent in the life of plants and flowers, is taken as an earnest and an allegory of a transfiguration of human nature which is of even greater moment than the destiny of any individual human soul. In the advent of 'the second man who is the Lord from Heaven', Paul hails 'the creation of a new species composed of one unique individual': the *adjutor Dei* whose mission it is to raise the rest of Mankind to a superhuman level by inspiring his fellow-men with his own inspiration from God.²

Thus the same *motif* of withdrawal and transfiguration leading up to a return in glory and power can be discerned in the spiritual experience of Mysticism and in the physical life of the Vegetable Kingdom and in the speculations of the human mind on human death and human immortality and in the creation of a higher out of a lower species. This is evidently a *motif* of cosmic range; and it is therefore not surprising to find that it has furnished one of the 'primordial images' of Mythology, which is an intuitive form of apprehending and expressing universal truths.³

One mythical variant of the *motif* is the story of the foundling. A babe born to a royal heritage is cast away in infancy—sometimes (as in the stories of Oedipus and Perseus) by his own father or grandfather who is warned by a dream or an oracle that his child is destined to supplant him; sometimes (as in the story of Romulus)

¹ See III. C (i) (c), above.

² See the passages from Bergson which are quoted on pp. 232 and 234-5 and 255-6, above.

³ For the nature of Mythology, see I. C (iii) (e), Annex, vol. i, p. 442, above. It was a discovery of Plato's that the mythopoeic activity of the human spirit was 'primary' not only in the sense of being 'primitive', but also in the sense of being 'profound', so that even the philosopher, in his highly sophisticated quest, might succeed in penetrating beyond the furthest limits to which reason and logic could carry him by bringing his mythopoeic faculty into play.

by a usurper, who has killed the babe's father or driven him out and fears lest the babe should grow up to avenge him; and sometimes (as in the stories of Jason and Orestes and Zeus and Horus and Moses and Cyrus) by friendly hands that are concerned to save the babe's life from the villain's murderous design.¹ The next chapter in the story is that the infant castaway is miraculously saved alive. Romulus is suckled by a she-wolf and Cyrus by a bitch² and Zeus by the goat—or nymph—Amalthea.³ Jason is reared by the Centaur Cheiron. Oedipus and Cyrus and Romulus are retrieved by shepherds.⁴ Moses floating in his ark of bulrushes among the flags is adopted by Pharaoh's daughter.⁵ Perseus and his mother, cast out to sea from Argos in a crazy chest, come safe to shore on Seriphos. In the third and last chapter the child of destiny—now grown to manhood and wrought to a heroic temper by the hardship through which he has passed—returns in power and glory to enter into his kingdom. Oedipus unwittingly slays and then succeeds his father Laius; Perseus unintentionally slays and then succeeds his grandfather Acrisius; Cyrus deliberately deposes and succeeds his grandfather Astyages; Jason compasses the death of his father's brother and supplanter Pelias; Orestes slays his father's cousin and slayer and supplanter Aegisthus; Romulus takes his revenge upon his father's brother and supplanter Amulius by founding a new city which eclipses Alba Longa; Horus overthrows his father's brother and slayer and supplanter Set and recalls Osiris to life and to power; Moses discomfits Pharaoh by delivering the Children of Israel from out of his hand; Zeus overthrows his own father Cronos. This is the story of the foundling; and in the Hellenic imagination this story loomed so large that it came to be a literary commonplace: a regular ingredient in the

¹ In the stories of Jason and Orestes and Horus the villain is a usurper who is the hero's uncle or cousin (a Pelias and an Aegisthus and a Set; compare Hamlet's usurping uncle who not only deposes but also murders his royal brother who is the father of the hero—as Set slays and dismembers Osiris). In the story of Moses the villain is a legitimate but tyrannical sovereign (Pharaoh; compare Herod in the story of Jesus). In the story of Cyrus the villain is a grandfather (Astyages; compare Acrisius in the story of Perseus). In the story of Zeus, the villain is the hero's father.

² In the Herodotean version of the Cyrus-myth, *Κυνώ* or *Σπακώ* is the name of the child's foster-mother (Herodotus, i. 110). In the Hellenic Mythology, the child who is suckled by a bitch is Neleus.

³ It is pointed out by M. P. Nilsson (in *Minoan-Mycenaean Religion and its Survival in Greek Religion* (London 1927, Milford), p. 501) that, in the Greek Mythology, the divine child who is reared by some one who is not his mother appears in Hyacinthus, Plutus, Erichthonius, and the Phrygian Dionysus, as well as in the Cretan Zeus. For this Cretan Zeus, see I. C (i) (b), vol. i, p. 98, above.

⁴ The Roman twins Romulus and Remus who are retrieved by a shepherd have their Hellenic prototypes in the twins Neleus and Pelias. Neleus (though not, apparently, Pelias) is suckled by a bitch, in consonance with the suckling of Romulus and Remus by a she-wolf.

⁵ Compare the story of Attis, who is hidden as a child among the reeds of the River Gallos and is afterwards taken up by the Goddess Cybele. (See Evans, Sir Arthur: *The Earlier Religion of Greece in the Light of Cretan Discoveries* (London 1931, Macmillan), p. 35.)

plots of the Attic 'New Comedy' and of the Hellenistic Novel. In our own Western folk-lore we find the same story in the fairy-tale of Hop-o'-my-Thumb.

In another mythical variant of the Withdrawal-and-Return *motif*, the hero is not cast out to perish of exposure as an infant, but is sent out as a youth to meet his death on some perilous quest. Perseus is sent by King Polydectes to bring the Gorgon's head; Jason is sent by King Pelias to bring the Golden Fleece; Bellerophon is sent by King Proetus to meet his death in Lycia from the Chimaera or the Solymi or the Amazons; Hêrâklês is sent by King Eurystheus to perform his Twelve Labours. In this variant of the story, the final chapter is the same. The hero defeats the villain's design by triumphantly performing his perilous task and returning from his ordeal in power and glory.¹

In the story of Jesus, the Withdrawal-and-Return *motif* perpetually recurs. Jesus is the babe born to a royal heritage—a scion of David or a son of God Himself²—who is cast away in infancy. He comes down from Heaven to be born on Earth; he is born in David's own city of Bethlehem yet finds no room in the inn and has to be laid in a manger, like Moses in his ark or Perseus in his chest. In the stable, he is watched over by friendly animals, as Romulus is watched over by the wolf and Cyrus by the hound, and as Bellerophon is befriended by Pegasus; and he also receives the ministrations of shepherds, and is reared by a foster-father of humble birth, like Romulus and Cyrus and Oedipus. Thereafter he is saved from King Herod's murderous design by being taken away privily to Egypt, as Moses is saved from Pharaoh's murderous design by being hidden in the bulrushes, and as Jason is placed beyond King Pelias' reach by being hidden in the fastness of Mount Pelion, and Cyrus beyond King Astyages' reach by being banished to the highland marches of Media.³ And then, at the end of the story, Jesus returns, as the other heroes return, to enter into His Kingdom. He enters into the Kingdom of Judah when, riding into Jerusalem, He is hailed by the multitudes as the Son of David. He enters into the Kingdom of Heaven in the Ascension.

In all this, the story of Jesus conforms to the common pattern of the story of the foundling babe; but in the Gospels the under-

¹ With this variant of the *motif* we must perhaps class Moses' flight in early manhood from Egypt to Midian, where he receives Yahweh's commission and then returns to Egypt with Yahweh's power working for and through him. Perhaps we should also regard as another variant of the Withdrawal-and-Return *motif* the curious masquerade of the youthful Achilles on Scyros and of the toil-worn Hêrâklês in the house of Omphalê. In masquerading as a woman, the mighty man of valour seems, at first sight, to have repudiated his own nature; but the masquerade is temporary, and the hero resumes his proper role in order to perform thereafter the mightiest deeds in his career.

² Compare the lineage of Perseus, who is both a grandson of Acrisius and a son of Zeus.

³ Herodotus, loc. cit.

lying *motif* of Withdrawal-and-Return presents itself in other shapes as well. It is present in each one of the successive spiritual experiences in which the divinity of Jesus is progressively revealed. When Jesus becomes conscious of His mission upon His baptism by John, He withdraws into the wilderness for forty days and returns from His Temptation there in the power of the spirit;¹ 'and they were astonished at his doctrine, for his word was with power',² 'for he taught them as one having authority, and not as the Scribes'.³ Thereafter, when Jesus realizes that His mission is to lead to His death, He withdraws again into the 'high mountain apart'⁴ which is the scene of His Transfiguration and returns from this experience resigned and resolved to die. Thereafter, again, when He duly suffers the death of mortal man in the Crucifixion, He descends into the tomb in order to rise immortal in the Resurrection. And, last of all, in the Ascension, He withdraws from Earth to Heaven in order to 'come again with glory to judge both the quick and the dead: whose kingdom shall have no end'.⁵

These crucial recurrences of the Withdrawal-and-Return *motif* in the story of Jesus likewise have their parallels. The withdrawal into the wilderness reproduces Moses' flight into Midian;⁶ the Transfiguration on the 'high mountain apart' reproduces Moses' transfiguration on Mount Sinai;⁷ the death and resurrection of a divine being is anticipated in the Hellenic Mysteries and is derived by the Mysteries themselves from the world-wide agrarian ritual and myth; the tremendous figure who is to appear, and dominate the scene, at the catastrophe which is to bring to an end the present mundane order, is anticipated in the Zoroastrian Mythology in the figure of the Saviour (*Saosyant*) and in the Jewish Mythology in the figures of the Messiah and 'the Son of Man'.⁸ There is, however, one feature in the Christian Mythology which seems to have no precedent; and that is the interpretation of the future coming of the Saviour or Messiah or 'Son of Man' as the future return to Earth of an historical figure who has already lived on Earth the life of a human being. In this flash of intuition, the timeless past of the Foundling Myth and the timeless present of the Agrarian Ritual are translated into the historical striving of Mankind to reach the goal of human endeavours, or, on a wider than human

¹ Luke iv. 14.² Luke iv. 32.³ Matt. vii. 29.⁴ Matt. xvii. 1.⁵ The Nicene Creed.⁶ There is, however, a significant difference in the nature of the spiritual experience in the wilderness by which the hero's soul is fortified. Moses in the wilderness encounters a benevolent numen, and receives an assurance of the kind of supernatural aid that Odysseus obtains from Athena. On the other hand, Jesus in the wilderness is fortified through being tempted by the Devil, like Job or Faust.⁷ The parallel here is an intentional feature in the story; for the three apostles who witness the Transfiguration see Moses as well as Elijah communing with Christ.⁸ See Gall, A. von: *Βασιλεία τοῦ Θεοῦ* (Heidelberg 1926, Winter).

range, into the unceasing travail of creation.¹ In the concept of the Second Coming, the *motif* of Withdrawal-and-Return attains its deepest spiritual meaning.²

After this attempt to grasp what Withdrawal-and-Return really means, we are perhaps in a better position to take an empirical survey of its working in human history through the interaction of creative personalities and creative minorities with their fellow human beings. There are famous historical examples of the movement in many different walks of life. We shall encounter it in the lives of mystics and saints and statesmen and soldiers and historians and philosophers and poets, as well as in the histories of nations and states and churches.³ In each instance, we shall see the creative personality or creative minority taking the path of Withdrawal-and-Return in order to rise to some occasion of social crisis: in order, that is to say, to cope with some challenge that is confronting the society to which the individual or the minority belongs.

Saint Paul

Among the mystics and the saints—to begin our survey with these—we see Paul of Tarsus being born into Jewry in a generation when the impact of Hellenism upon the Syriac Society was presenting a challenge which no living Jew could evade. How was the Syriac genius to react? In the spirit of the Jewish Zealots, who sought to meet the Hellenic challenge by putting on the whole armour of the Jewish Law and violently repudiating Hellenism and all its works—both material and spiritual? This was in fact the original reaction of Paul:⁴ a born propagandist who had received the conventional education of a Pharisee in the Jewish 'Diasporà'.⁵ And the first chapter in Paul's career was devoted to persecuting the Jewish followers of Jesus, who were guilty, in Jewish Zealot eyes, of making a breach in the Jewish community's ranks. In the last chapter of his career, Paul employed his gifts of propaganda in responding to the challenge of Hellenism in a totally different way. He sought to solve the problem of Helleno-Syriac relations by peace instead of war. He preached a new dispensation 'Where there is neither Greek nor Jew, circumcision nor uncircumcision, Barbarian, Scythian, bond nor free'⁶—and he preached this in the name

¹ Romans viii. 22.

⁶ Colossians iii. 11.

of Jesus, whose Gospel of non-violence and universal brotherhood and divine love he carried to its logical conclusion in his mission to the Gentiles. Paul's *volte-face* not only scandalized the Zealots whose camp he had abandoned; it even caused some searchings of heart among the leaders of the Jewish Christian Church. Yet this last chapter was the creative chapter in Paul's career; the first chapter was a false start; and between the two chapters a great gulf was fixed. After his vision on the road to Damascus, in which he was suddenly enlightened, Paul withdrew into the wilderness, as Jesus himself had withdrawn after his sudden enlightenment at the moment of his baptism by John.

'When it pleased God,' Paul writes, 'to reveal his Son to me, that I might preach him among the heathen, immediately I conferred not with flesh and blood, neither went I up to Jerusalem to them which were apostles before me, but I went into Arabia and returned again unto Damascus. Then after three years I went up to Jerusalem to see Peter.'¹

In the Arabian wilderness, Paul thought out—or felt out—a new philosophic and emotional interpretation of Christianity; and from this creative withdrawal he returned, with all the native powers of his genius heightened and focused upon his life-work, in order to preach this Pauline Christianity to the *Orbis Romanus*.

A Pair of Saviours

The challenge presented by the final bankruptcy of the Hellenic culture to the stricken and stunned population of the derelict Roman provinces in the West was taken up by two saints—one a born educator and the other a born administrator—who lived through the blackest years of the sixth century of our era in Italy. Benedict of Nursia (*vivebat circa* A.D. 480–543)² was born just after the first barbarian 'successor-state' of the Roman Empire was set up by Odovacer in Italy, and he died in the throes of the long-drawn-out and devastating war between the Ostrogothic 'successor-state' and the Imperial Government of Constantinople—a war which was the worst that Italy had undergone since the War of Hannibal, and which completed the destruction of the ancient order of society in the peninsula. Gregory the Great (*vivebat circa* A.D. 540–604) was born in the middle of the Great Romano-Gothic War, a few years before Benedict's death, and he lived to see the brief Imperial Restoration in Italy, which followed the overthrow of the barbarian Goths, undone by the irruption and permanent lodgement of the far more

¹ Galatians i. 15–18.

² Dom John Chapman interprets the evidence as showing that Benedict lived on into the sixth decade of the sixth century (*Saint Benedict and the Sixth Century* (London 1929, Sheed and Ward), ch. viii).

barbarous Lombards. Both saints were launched by their parents on the conventional career of their society and class and generation; both showed their creative genius in rebelling against the outworn convention and breaking away; and both brought their genius to fruition by withdrawing for a time from the World and disentangling themselves from the trammels of Society in order to return in due course with a new moral power and a new practical policy for dealing with a new state of affairs to which the old conventional order had no application. In these two returning anchorites, the lost sheep of Western Christendom found shepherds to convert their soul and to comfort them with pastoral rod and staff as they walked through the valley of the shadow of death.¹

Saint Benedict. Benedict,² sent as a child from his Umbrian birthplace to Rome in order to receive the traditional upper-class education in the humanities, revolted at the life in the capital and withdrew into the wilderness at this early age. In a cave—the *Sacro Speco*—in the Valley of Subiaco he lived for three years of his youth the life of a complete anchorite in utter solitude; but the turning-point in his career—an event of still greater importance than his original break-away—was his return to social life upon reaching manhood when he consented to become the head of a monastic community: first in the valley of Subiaco and eventually on Monte Cassino. In this last creative chapter of his career, the saint improvised in the wilderness a new education to take the place of the obsolete system which, years before, in Rome, the child had rejected. And Benedict's Senatorial contemporaries, who had never departed in their own careers from the traditional rut, now sent their sons out into the wilderness to be brought up there in a new discipline by a Christian Cheiron. Moreover, the Benedictine community on Monte Cassino became the mother of monasteries which increased and multiplied until they had spread the Benedictine Rule into the uttermost parts of the West; and this Rule was one of the main foundations of the new social structure which was eventually raised in Western Christendom on the ruins of the ancient Hellenic order.

'This Rule, extending to only seventy-three short chapters . . . and not probably designed by its author for use much beyond the bounds of the communities under his own immediate supervision, proved to be the thing which the world of religious and thoughtful men was then longing for: a complete code of monastic duty. Thus, by a strange parallelism, almost in the very year when the . . . Emperor Justinian was codifying the results of seven centuries of Roman secular legislation

¹ Psalm xxiii.

² For Benedict's career see Hodgkin, T.: *Italy and her Invaders*, vol. iv, 2nd ed. (Oxford 1896, Clarendon Press), ch. xvi.

—[a Herculean task which was virtually labour lost]—Saint Benedict on his lonely mountain-top was unconsciously composing *his* code for the regulation of the daily life of the great civilizers of Europe for seven centuries to come.¹

One of the most important features in Benedict's rule was the prescription of manual labour; for this meant, first and foremost, agricultural labour in the fields.² The Benedictine movement was, in fact, on the economic plane, an agricultural revival: the first successful revival of agriculture in Italy, after innumerable abortive attempts, since the destruction of the ancient Italian peasant-economy in the Hannibalic War seven-and-a-half centuries earlier. The Benedictine Rule achieved what had never been achieved by Gracchan agrarian laws or by Imperial *alimenta* because it did not work, as state action works, from above downwards upon individuals who would not and could not have taken the initiative for themselves if the authorities had not taken it on their behalf, but worked, on the contrary, from below upwards, by evoking the individual's initiative through enlisting his religious enthusiasm.³ By virtue of this spiritual *élan*, the Benedictine Order not only turned the tide of economic life in Italy at the moment when it was at its lowest ebb. It also performed in medieval Transalpine Europe that strenuous pioneer work of clearing forests, draining marshes, creating fields and pastures, and starting manufactures which were performed in modern North America by the French and English backwoodsmen.

¹ Hodgkin, *op. cit.*, p. 440. At the point in this passage where the writer of this Study has inserted his own parenthesis, Dr. Hodgkin describes Justinian as working 'for the benefit of the judges and the statesmen of the new Europe'. It is true that, after the interregnum and the Dark Age, the Justinianean *Corpus Juris* was, so to speak, rediscovered—in Orthodox Christendom in the tenth century and in Western Christendom in the eleventh—and this discovery undoubtedly produced a profound effect thereafter upon legal thought and practice in both these societies. This, however, was in the nature of a legal 'renaissance'; and, in making a comparison between Justinian's and Benedict's legislative work, it is perhaps more pertinent to bear in mind that, whereas Benedict's Rule was a new kind of legislation which broke new ground and, in breaking it, fulfilled an urgent need, Justinian was codifying a law which was not merely old, but was on the verge of becoming an anachronism owing to the disappearance of the social conditions which the Roman Law had been designed to meet. For fully three centuries after the Justinianean codification was completed, this code was altogether inapplicable to the new social conditions that supervened upon the final bankruptcy of the Hellenic culture. And, in view of this, Justinian's work may fairly be called 'labour lost'.—A. J. T.

² *Benedicti Regula Monachorum*, ch. xlviii, 'De Opera Manuum Cotidianarum': 'Otiositas inimica est animae, et ideo certis temporibus occupari debent fratres in labore manuum, certis iterum horis in lectione divina. . . Si autem necessitas loci aut paupertas exegerit ut ad fruges recolligendas per se occupentur, non contristentur, quia tunc vere monachi sunt si labore manuum suarum vivunt sicut patres nostri et apostoli. Omnia tamen mensurate fiant propter pusillanimes.'

³ Unlike either the recipients of the Gracchan land-allotments or the farmers who received the loans in which the capital applied to the *Alimenta Italiae* was invested, the Benedictine workers on the land were not free men but slaves. Their master, however, was no human slave-owner but God; and the ex-slaves of human masters found themselves on a footing of perfect equality with ex-freemen when they entered the Benedictine Order. 'Non convertenti ex servitio praeponatur ingenuus, nisi alia rationabilis causa existat. . . quia, sive servus sive liber, omnes in Christo unum sumus et sub uno Domino aequalem servitutis militiam baiulamus' (*Regula*, ch. ii).

The Benedictine pioneers, however, were no mere hewers of wood and drawers of water for the civilization which they served; for their manual labour included the work of the pen as well as the work of the spade. Wherever they founded a new cell, they introduced a mental as well as a material culture; and one of the incidental results of their industry was the preservation of the Classical Latin literature—the vehicle of that traditional Roman education which Benedict himself had rejected at the outset of his career.

Saint Gregory the Great. In the career of Gregory the Great,¹ the break-away was not achieved at so early an age. Born and bred in Rome itself, Gregory appears to have acquiesced not only in the conventional education, but also in the conventional bureaucratic career until he found himself occupying the post of *Praefectus Urbi*²—civil governor of the Imperial City—in or about the year 573; and it seems to have been his experience in this office that led him, at this stage, to make an abrupt change in his course.

The fact was that, in A.D. 573, the *Praefectus Urbi* was faced with an impossible task; for in 573 the City of Rome was in much the same predicament as the City of Vienna in 1920. A great city which had become what it was—in its government and its livelihood and its population—in virtue of having been the capital of a great empire for a number of centuries, now suddenly found itself cut off from its former provinces, deposed from its traditional rank, deprived of its historic functions, and thrown back, all unprepared, upon its own resources. In most of these respects, the reversal of fortune which Rome suffered in the sixth century of the Christian Era was even more extreme than the similar experience of Vienna in the twentieth century. At her zenith, Rome had been the political capital of the entire Basin of the Mediterranean and the social and economic capital, likewise, of the western half of it—including a Transalpine annex that extended to the Rhine and the Tyne.³ By A.D. 573, the political capital of the Roman World had been transferred from Rome to Constantinople, while in the West the Roman dominions had been cut short until the frontiers had fallen back to the outskirts of Rome itself. The brief Imperial Restoration in Italy that had followed the devastating Romano-Gothic War had been brought to an end by the avalanche of the Lombard invasion which had overwhelmed Northern Italy in A.D. 568 and had spread

¹ For Gregory's career see Hodgkin, *op. cit.*, vol. v (Oxford 1895, Clarendon Press), ch. vii; Dudden, F. H.: *Gregory the Great: His Place in History and Thought* (London 1905, Longmans, Green and Co., 2 vols.). Little is added to these two studies by Batiffol, P.: *Saint Gregory the Great* (London 1929, Burns, Oates, and Washbourne).

² The better attested reading in the manuscripts is 'praetoram'; but since the urban praetorship was extinct in Gregory's time, whereas the urban praefecture was a still surviving office, the less well attested reading 'praefecturam' is to be preferred. (See Dudden, *op. cit.*, vol. i, p. 101.)

³ For this annex, see I. B (iv), vol. i, pp. 39 and 40, above.

to the Centre and the South in 570-2, when roving Lombard war-bands had established themselves in Spoleto and Benevento. In the year of Gregory's prefecture, the *Ager Romanus* in the environs of Rome itself was restricted approximately to the area which it had occupied, some nine centuries back, before the Romans had embarked on their struggle with the Samnites for the hegemony over Italy.¹ The territory which had supported the tiny rural market-town of that age had now to support a vast parasitic ex-capital city; and the Imperial bureaucracy, of which the *Praefectura Urbis* was a part, was impotent to cope with a problem that had never been envisaged by the Imperial statesmen who had installed the bureaucratic machine.

This impotence of the old order to deal with the new state of affairs must have been borne in upon the mind of a Roman magnate who held the *Praefectura Urbis* in or about A.D. 573; and that painful experience would fully account for Gregory's break-away, which occurred two years later, about A.D. 575. Gregory now withdrew entirely from the secular world. He applied his estates in Sicily² to the foundation and endowment of six Benedictine monasteries and distributed the rest of his property to the poor—except for his ancestral palace in Rome, which he turned into another monastery in order to enter it himself, not as the abbot but as an ordinary monk. Gregory's withdrawal—like Benedict's and Paul's—was of three years' duration; and at the end of that period he was in the act of withdrawing still farther—to Ultima Thule—on the enterprise of converting the heathen English; but at that moment—and this was the true turning point in Gregory's career—he was recalled to Rome by the Pope, in deference to an urgent popular demand, and was constrained to bring his administrative gifts into play once more in the service of the afflicted City. He served Rome henceforth in capacities in which he could use those gifts effectively.

Gregory's life-work, which began with his return and never ceased until his death in harness, was performed in the role of an ecclesiastical administrator and diplomatist and statesman. He performed it first as Seventh Deacon of the Roman See (the officer responsible for the social welfare work of the Church in the City); then, from about 579 to 585, as Apocrisiarius (the Papal representative at the Imperial Court of Constantinople); and finally as Pope, from 590 to his death in 604. Gregory was elected to the Papacy by *force majeure* in a year of war and pestilence and famine,³ and he

¹ For details see Hodgkin, *op. cit.*, p. 350.

² We may conjecture that these Sicilian estates were the only part of Gregory's property in agricultural land, outside the walls of Rome, that had not been lost in consequence of the Lombard invasion.

³ After his return from his diplomatic mission in Constantinople he had withdrawn again to his monastery in Rome—this time as its abbot.

bore heroically the burden which he had shrunk from accepting.¹ On the Papal throne, he accomplished three great achievements. In the first place, he reorganized the administration of the *Patrimonia Petri*—the estates of the Roman Church in Italy and overseas—with such efficiency that the condition of the serfs was improved while at the same time revenues were raised for relieving, on the grand scale, the distress of the destitute population of the derelict Imperial City.² Gregory's second achievement—a labour of ten years—was to negotiate a *modus vivendi* in Italy between the Imperial authorities and the Lombards on a basis of *uti possidetis*.³ His third achievement was to lay the foundations of a new empire for Rome in the place of her old empire which now lay in ruins. This new Roman Empire, established by religious propaganda and not by military force, was eventually to conquer new worlds whose soil the legions had never trodden and whose very existence had never been suspected by the Scipios and Caesars. And the first step towards this re-establishment of the Roman Empire in a new and more ethereal form was the recovery of a Roman foothold in Britain through the mission of Augustine: the Abbot of Gregory's own monastery in Rome, whom Gregory the Pope dispatched in A.D. 596 to carry out an enterprise which Gregory the anchorite had aspired to undertake in person nearly twenty years earlier. Thus, at Rome's darkest hour, when the Lombards were at her gates, her sacerdotal shepherd and captain audaciously out-maneuvred the Continental Barbarians by sending his lieutenant overseas to acquire new allies for Rome, and to win her a new sphere of influence, in the enemy's rear. The spirit of the Roman Pontiff in A.D. 596 is worthy of comparison with that which had been shown, eight centuries back, by the Roman Senate in 211 B.C. when, with Hannibal at the Gates, they had shipped troops out of Rome down the Tiber to reinforce their armies in Spain.⁴

¹ For Gregory's distress at leaving the life of contemplation, once for all, for the life of action see his letter to Theoctista, the sister of the Emperor Maurice, in which he analyses his feelings about his appointment (*Letters*, Bk. I, letter 5). See further Hodgkin's observations in *op. cit.*, pp. 304-6.

² For Gregory's administration of the *Patrimonia* of the Roman Church, see Dudden, *op. cit.*, vol. i, pp. 296-320. For his organization of relief work in the City, see vol. i, pp. 247-51.

³ See Hodgkin, *op. cit.*, pp. 418-21.

⁴ 'Cum ipse [Hannibal] ad moenia urbis Romae armatus sederet, milites sub vexillis in supplementum Hispaniae profectos audiit' (Livy xxvi. 11). Another parallel in Roman history to Gregory's dispatch of Augustine to Britain—a parallel, in this case, from the history of Gregory's own age—is the Emperor Heraclius's audacious and successful strategy of sailing with the flower of his troops from Constantinople in the spring of A.D. 622, when a Persian army lay encamped at Calchedon, just across the Golden Horn, in order to take the enemy in the rear by disembarking his expeditionary force at Alexandretta. The preceding winter had been spent by Heraclius in retirement (see Bury, J. B.: *A History of the Later Roman Empire* (London 1889, Macmillan, 2 vols.), vol. ii, pp. 224-5).

Saint Ignatius Loyola

Another saint whose life-work had its overture in a withdrawal and a return is Ignatius Loyola. Loyola was born into Catholic Christendom in an age when the medieval standing of the Roman Church as the master-institution of the Western World had been challenged, and when its very existence as well as its supremacy had been placed in jeopardy, by the renaissance of Paganism in Italy and the eruption of Protestantism in Transalpine Europe. In this religious and social crisis Loyola, born a Spanish nobleman, was brought up in the Spanish nobility's conventional atmosphere and served in the Spanish Army till his twenty-seventh year,¹ when he was badly wounded in a siege of Pamplona by the French. The wound necessitated an operation from which the patient almost died; but he was just able to recover; and during his convalescence he underwent a religious conversion. In the year following these events, which had all taken place in A.D. 1521, Loyola dedicated himself to fight thenceforward as a soldier for God; but he did not rush straight into action in this new form of warfare. He spent the next twelve years in retreat: on pilgrimage, in asceticism, in study, and in meditation. It was only after this long withdrawal that he returned to the World at last in order to establish the Society of Jesus. The Society did not begin to take shape till the year 1534; it did not receive recognition from the Pope until 1540; and Loyola himself was not elected to be its first General until 1541. In Loyola's career, the *motif* of Withdrawal-and-Return is conspicuously manifest.

The Buddha

The *motif* is almost equally conspicuous in the career of a genius who was born into a wholly different time and place and whose temperament was at the opposite extreme of the human gamut: Siddhārtha Gautama the Buddha. Gautama was born into the Indic World in its 'Time of Troubles'.² In the devastating internecine warfare between contending states, he lived to see his native city-state Kapilavastu sacked, and his Sakyan kinsmen massacred. The small aristocratic republics of the early Indic World, of which the Sakya community was one, appear, in fact, to have been succumbing in Gautama's generation to rising monarchies which were autocratically governed and were built on a larger scale. Thus

¹ We have Loyola's own authority for the statement that he was twenty-six years old at the time of his conversion; and since the conversion evidently took place immediately after he received his wound at the siege of Pamplona—i.e. in A.D. 1521—it follows that he was born in A.D. 1495. (See Sedgwick, H. D.: *Ignatius Loyola* (London 1923, Macmillan), pp. 392-3.)

² For the symptoms, see I. C (i) (b), vol. i, pp. 86-7, above.

Siddhārtha Gautama was born a Sakya aristocrat at a moment when the older Indic social order, in which this aristocracy had its recognized place, was being challenged by new social forces. Gautama's personal retort to this challenge was to renounce a world which was becoming inhospitable to aristocrats of his ancestral kind. According to the tradition, it was at the age of twenty-nine that he abandoned his wife and son and wealth and rank and inheritance—he was the son of a 'king'¹—and 'went out from the household life into the homeless state',² in order to seek enlightenment through asceticism. This quest continued without result for seven years during which Gautama constantly increased the severity of his physical self-mortification until he had carried it to the furthest extremity consistent with remaining alive. It was not until he had taken the first step towards returning to the World by breaking his fast that the light broke in upon him. And then, after he had attained the light for himself, he spent the rest of his life in imparting it to his fellow human beings.³ In order to impart it effectively, he allowed a company of disciples to gather round him and thus became the centre and head of a fraternity.

The return of the ascetic Gautama to Society as the enlightened Tathāgata is remarkable when we consider what the mental content of the Buddha's enlightenment was. In his philosophy, the highest aim and happiest state of the human soul was something still more remote from action than the contemplative *θεωρία* which was the Hellenic ideal of Pythagoras and Plato and Plotinus. It was nothing short of spiritual self-annihilation. And while Plato paid lip-service to the duty of return, the Buddha proclaimed the philosopher's right to escape into the freedom of Nirvana if only he could win his own way thither. Nevertheless, the Buddha did return to the World more sincerely, and therefore more effectively, than Plato. The foundation of the Sangha was a greater social achievement than the foundation of the Academy; and in the record of the Buddha's relations with princes there is none of the pedantry which appears in Plato's relations with Dionysius. The subsequent histories of Buddhism and Platonism point and accentuate this contrast. We have seen already⁴ that Plato's injunction to return was repudiated, both in doctrine and in practice, by the first of the Neo-Platonists. On the other hand, the actual return of the Buddha—which was in logical contradiction with his doctrine, besides being

¹ The 'kingship' of Gautama's father seems to have been no more than a primacy *inter pares*. The constitution of the Sakya Commonwealth was oligarchical rather than monarchical. (See Eliot, Sir Charles: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. i, p. 131.)

² Eliot, *op. cit.*, vol. i, p. 135.

³ Eliot, *op. cit.*, vol. i, pp. 138-40.

⁴ On p. 254, above.

against his personal inclination¹—became the central feature of the Neo-Buddhism which took shape in the Mahayana or Great Vehicle. One of the new and distinguishing features of the Mahayana is 'a code of altruistic ethics which teaches that everyone must do good in the interest of the whole World and make over to others any merit he may acquire by his virtues. The aim of the religious life is to become a Bodhisattva, not to become an Arhat.'² The Arhat is an adept who has attained the Buddhist goal of self-annihilation for himself; and according to the Mahayana 'the Arhat, engrossed in his own salvation, is excused only by his humility and is open to the charge of selfish desire, since the passion for Nirvana is an ambition like any other'.³ The Bodhisattva is a potential Arhat or aspirant Buddha who voluntarily postpones his own entry into Nirvana when he has reached the threshold and stands before the open door, and thus sacrifices his own happiness by prolonging his own existence as a sentient being among sentient beings, in order to help his fellow-creatures to reach the point which he himself has reached already on their common path.⁴ It would seem that the impulse to consummate a movement of withdrawal by a counter-movement of return must be deeply grounded in the nature of the human soul, and perhaps in the nature of the Universe itself, if it has asserted itself so insistently in Buddhist practice, in despite of Buddhist teaching and Buddhist belief.

David

When we pass from the lives of mystics and saints to those of statesmen and soldiers, the Withdrawal-and-Return *motif* reveals itself in this field again.

In the Syriac saga, for example, David begins his career as a mighty man of valour in Saul's war-band. In other words, the

¹ See Eliot, *op. cit.*, vol. i, p. 140. This inclination to remain aloof, which the enlightened Buddha overcame in his own soul, was a vestige of the ordinary attitude of the unregenerate Indic anchorites of Gautama's generation; and, according to the legend, the conventional opinion of these anchorites had been scandalized by Gautama's very first step towards his return, when he broke his fast. 'There were five monks living near him, hoping that when he found the Truth he would tell it to them. But when they saw that he had begun to take food, their faith failed and they went away' (Eliot, *op. cit.*, vol. i, p. 139). The Buddhist legend goes on to relate that the Buddha succeeded—though not without difficulty—in converting these five monks to a recognition of his Buddhahood, in spite of the scandal of his return to 'a life of ease' (Eliot, *op. cit.*, vol. i, pp. 140-1). In the story of Jesus, this incident has its parallel in the scandal caused among the Pharisees by the formal breach of the Sabbath when the disciples of Jesus satisfied their hunger, with their master's approval, by plucking and eating ears of corn on the Sabbath day (Matt. xii. 1-8). For the Pharisees, the return of Jesus to ordinary social intercourse after his forty days of ascetic withdrawal in the wilderness was an insuperable stumbling-block.

'The Son of Man came eating and drinking, and they say: "Behold a man gluttonous and a wine bibber, a friend of publicans and sinners".' (Matt. xi. 19.)

⁴ See Eliot, *op. cit.*, vol. ii, pp. 7-11.

future hero first appears on the scene as just an outstanding representative of what is, in itself, a common type in the society into which he has been born. It is not until Saul's jealousy has driven David into the wilderness, to lead the precarious life of an outlaw in the no-man's-land between Israel and Philistia, that David begins to acquire the statesmanship which eventually marks him out to be Saul's successor. And it is this statesmanship, thus acquired, that enables David, after his return from the wilderness, to solve for Israel the urgent problem of the age which Saul has failed to solve effectually: the problem of endowing the people of the hill-country with a political organization that will enable them to hold their own against the people of the coast.

Solon

Solon, again, was born into a rustic Attica in an age when Attica, in common with the whole Hellenic World, was confronted with the problem of continuing to provide for a population which was not ceasing to increase, yet which could not any longer be provided for by the old method of geographical expansion.¹ Solon's personal reaction to this social challenge was to withdraw from the agrarian life amid which he had been brought up and to take to the life of a merchant: a life which was something exotic in Attica at the turn of the seventh and sixth centuries B.C. While the majority of Solon's countrymen were still engrossed in the desperate business of obtaining diminishing returns from sowing and reaping increasing quantities of the traditional crops, Solon took to buying and selling and exporting and importing and travelling overseas and acquainting himself with the newfangled technique of a money economy. But he only withdrew for a season from the common round of Attic rural life in order to return to the land with a practicable scheme of economic salvation. By applying the new mercantile technique to the old industry of agriculture, Solon discovered the secret of substituting intensive development for extensive expansion; and he returned to teach his countrymen how to enhance the economic productivity of their land and labour by giving up 'subsistence farming' in favour of 'cash-crop farming' in specialized crops produced for export. Thus Solon's withdrawal from Attic agriculture to overseas trade was a prelude to his return to Attic agriculture in a new capacity. The first change in Solon's career—the change from farmer to merchant—led up to the second, and vital, change from merchant to statesman. And it was in his return to the land as a statesman that Solon accomplished his life-work.

¹ See vol. i, pp. 24-5, and vol. ii, pp. 39-42, as well as the present volume, pp. 122 and 139-40 and 168-9, above.

In the history of Philopoemen of Megalopolis, we find a Hellenic analogue of the Syriac saga of David. Born in the heart of the Peloponnese in an age when the city-states of Greece were being dwarfed by the new Powers of vastly greater calibre that had sprung up all around them on the periphery of an expanding Hellenic World, Philopoemen started his career as a spirited young soldier in the Macedono-Lacedaemonian War of 224-221 B.C.; and he covered himself with distinction at Sellasia. When the overthrow of Cleomenes in that decisive battle had restored peace to Continental Greece for the time being, Philopoemen withdrew for ten years (*circa* 220-210 B.C.) to Crete in order to train himself in the arts of generalship and statesmanship in that miniature island-world apart within the great and growing oecumenical society of Philopoemen's day. From this Cretan apprenticeship, into which he had entered as a mere soldier, Philopoemen returned to the Peloponnese at the end of ten years as an experienced man of affairs; and it was only after that, upon his first election to the annual generalship of the Achaean Confederacy in 208 B.C., that he began his life-work—the work of piloting the frail and puny Achaean ship of state through perilous seas over which new storm-clouds were gathering from beyond the western horizon.¹

Caesar

The same *motif* reveals itself in a far more famous political career. When Caesar withdrew from Rome to Gaul in 58 B.C., he was still to outward appearance nothing more than a virtuoso in the regular role of the Roman politician of the day: a player of the conventional game for the sake of the conventional prizes. During the nine years that passed before he re-emerged from Gaul in 49 B.C. and crossed the Rubicon, he grew in political and moral stature till even his bitterest opponents were compelled to recognize him, in their heart of hearts, as the one possible Saviour of Society—if Society would consent to allow itself to be saved.

Leo Syrus

The *motif* reappears in the career of Leo Syrus² (*imperabat* A.D.

¹ For the metaphor of 'the clouds from the west', which was first employed, apropos of Rome and Carthage, by Agelaus of Naupactus in the peace-pourparlers of 217 B.C. between the Aetolian Confederacy and the Macedonian Alliance, see Polybius, Bk. V, chs. 103-5.

² The grounds for regarding Leo as a 'Syrian' (i.e. as a native of the administrative area which was known in the political geography of the Later Roman Empire as *Oriens* or *Ἀνατολή*) are given by Bury in his edition of Gibbon (Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, edited by Bury, J. B.: *Editio Minor* (London 1900-2, Methuen, 7 vols.), vol. v, p. 185, footnote 17). Leo's family appear to have been natives of the city of Germanicea, in Commagene, among the south-eastern foot-

717-40): the great statesman who saved the infant civilization of Orthodox Christendom from meeting its death before it was out of the cradle.

In the history of Leo, there are some features that recall the Syriac saga of David, and others that recall the Hellenic myths of Jason and Bellerophon.¹ Like David, Leo first appears upon the scene as a mighty man of valour in a prince's war-band. He comes to the notice of the Emperor Justinian Rhinotmetus, as David comes to the notice of King Saul, by presenting himself in the prince's camp as a shepherd-boy bringing rustic gifts from the produce of his father's flocks; and in the prince's service he displays a prowess which only serves to draw down upon him his royal master's deadly jealousy. The historical Emperor Justinian II was in fact, throughout his history, a by-word for that demoniac vein of passion and implacability that is attributed in the Syriac saga to Saul. But, in the saga of Leo, the hero's master, when he seeks to compass the hero's death, does not adopt the direct methods of a Saul but resorts to the guile of a Pelias or a Proetus. Leo is sent by Justinian, as Jason is sent by Pelias, on a perilous quest to the Caucasus; and Justinian takes treacherous measures to ensure that his victim shall meet his death which are quite in the manner of Proetus's treacherous dealing with Bellerophon. Leo, however, like his mythical and historical prototypes, achieves the impossible and not only escapes alive but triumphantly fulfils his mission, so that when he returns—leading home from the Caucasus a marooned Roman army in a Xenophontic catabasis that duly ends at Trebizond—he is greeted as the heaven-sent saviour of the Roman People and eventually takes the place of his long since discomfited and discredited and evicted master on the Imperial throne.

Whatever may be the respective ingredients of fact and fable in the story of Leo up to this point, it is certain that Leo returned to Romania from the Caucasus in A.D. 713 as a seasoned statesman who was ripe to enter upon his life-work; and it was in the last chapter of his career, which opened now, that he performed his three historic achievements. In A.D. 716-18, he defeated the second and supreme effort of the Arabs to overwhelm Orthodox Christendom by force of arms and to make themselves masters of Con-

hills of the Taurus Range. The family left their Asiatic home as refugees, and found a new home in Thrace, when Commagene was conquered from the Romans by the Arabs some time during the first reign of Justinian II (A.D. 685-95).

¹ Leo's personal history (which has been touched upon in this Study, by anticipation, in I. C (i) (b), vol. i, on p. 64, footnote 3, above) is recounted in the *Chronographia* of Theophanes retrospectively, *sub Anno Mundi* 6209, which was the year of Leo's accession to the Imperial throne of Constantinople. The story reads like a genuine record of fact which has become suffused with traditional or legendary motifs—a well-known tendency in the stories of historical personalities that have made a deep impression upon the popular imagination.

276 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
stantinople. Thereafter, he provided for the future security of the infant civilization whose life he had saved from out of the jaws of destruction by evoking, in Orthodox Christendom, a ghost of the Roman Empire¹—and this with a thoroughgoing efficiency and an enduring effect that stand out in impressive contrast to the superficial and ephemeral re-establishment of the same great institution in the West by Charlemagne half a century later. Leo not only consolidated his East Roman Empire territorially, with Anatolia—now salvaged from the Arabs—as its centre of gravity and Constantinople as its European bridge-head. He gave his new state such solid administrative and military and financial and legal and economic foundations that it remained ‘a going concern’ for little short of five centuries after his reign, whereas ‘the Holy Roman Empire’ of the West faded away into the nullity of ‘a ghost of a ghost’ almost immediately after the death of the founder and was never successfully resuscitated—not even by the energy of an Otto I or by the genius of a Frederick II. Leo’s third historic achievement was the impress which he set upon the history of the Orthodox Church: a permanent impress in the supremacy over the Church which he vindicated for his re-animated State, and a temporary yet nevertheless profoundly important impress in his initiation of the Iconoclastic Movement. In both the successful and the abortive part of his ecclesiastical policy, Leo, in the eighth century of the Christian Era, brought about developments in Orthodox Christendom which did not take place in Western Christendom until the time of the Protestant Reformation, some seven centuries later. It will be seen that in Leo’s career the movement of Withdrawal-and-Return, represented by the Caucasian episode, was the prelude to a titanic output of creative activity after the hero’s restoration to the society of which he became the saviour.

Muhammad

A still more effective statesman in whose career the Withdrawal-and-Return *motif* is strongly marked is the Prophet Muhammad, who was born into the Arabian external proletariat of the Roman Empire in an age when the relations between the Empire and Arabia were coming to a crisis. At the turn of the sixth and seventh

¹ This ghost of the Roman Empire was evoked by Leo to serve as a ‘carapace’ for Orthodox Christendom against the assaults of the Syriac universal state, which had been reintegrated in the shape of the Arab Caliphate. Thus the East Roman Empire, during the eighth, ninth, and tenth centuries of the Christian Era, performed for Orthodox Christendom the service which was performed for Western Christendom during the sixteenth, seventeenth, and eighteenth centuries by the Danubian Hapsburg Monarchy, when it was serving as a ‘carapace’ against the assaults of the Ottoman Empire (which, it may be recalled in passing, was the universal state of the Orthodox Christian Society). For the simile of the ‘carapace’ see I. C (iii) (b), vol. i, p. 156, footnote 1, and II. D (v), vol. ii, p. 177, footnote 1.

centuries of the Christian Era, the saturation-point had been reached in the impregnation of Arabia with cultural influences from the Empire through the cumulative effect of a long-continuing process of social radiation.¹ Some reaction from Arabia upon the Empire, in the form of a counter-discharge of energy, was bound to ensue; and the destinies of both parties to the Arabo-Roman interaction were deeply involved in the open question of what direction this imminent Arabian recoil would take and what plane of social activity it would choose for its principal field of action. It was the career of Muhammad (*vivebat circa* A.D. 570-632) that gave these questions their historic answers; and a movement of Withdrawal-and-Return was the prelude to each of the two crucial new departures upon which Muhammad's life-history hinges.

There were two features in the social life of the Roman Empire in Muhammad's day that would make a particularly deep impression upon the mind of an Arabian observer because, in Arabia, they were both conspicuous by their absence. The first of these features was monotheism in religion.² The second was law and order in government. Muhammad's life-work consisted in translating each of these elements in the social fabric of 'Rūm' into an Arabian vernacular version and incorporating both his Arabianized monotheism and his Arabianized imperium into a single master-institution—the all-embracing institution of Islam—to which he succeeded in imparting such titanic driving-force that the new dispensation, which had been designed by its author to meet the needs of the barbarians of Arabia, burst the bounds of the Peninsula and captivated the entire Syriac World from the shores of the Atlantic to the coasts of the Eurasian Steppe.

This life-work, upon which Muhammad seems to have embarked in about his fortieth year (*circa* A.D. 609), was achieved in two stages. In the first of these stages, Muhammad was concerned exclusively with his religious mission; in the second stage, the religious mission was overlaid, and almost overwhelmed, by the political enterprise. Muhammad's original entry upon a purely religious mission was a sequel to his return to the parochial life of Arabia after a partial withdrawal (*circa* A.D. 594 seqq.)³ into the exotic life of a caravan-

¹ For this phenomenon of social radiation, see Part II. A, vol. i, p. 187, and III. C (i) (a), pp. 151-3, above, and V. C (i) (c) 3, vol. v, pp. 196-203, as well as Parts VIII and IX, below.

² See III. C (ii) (a), p. 238, above.

³ The dates of Muhammad's caravan-expeditions are instructive. They fall within the short interval of peace (A.D. 591-603) between the two long-drawn-out and devastating Romano-Persian Wars of A.D. 572-91 and A.D. 603-28. We do not know the exact year in which Muhammad's expeditions between Mecca and Syria ceased, but we may conjecture that they were brought to an end by the general paralysis of economic life in the Asiatic provinces of the Roman Empire that must have resulted from the Persian invasions. The expeditions had evidently ceased before Muhammad's entry upon his prophetic mission, and, if that is to be dated about A.D. 609, we may bring this date into relation with the Persian invasion of Syria in A.D. 606 and with the occupation of Calche-

trader between the Arabian oases and the Syrian desert-ports of the Roman Empire along the fringes of the North Arabian Steppe. The second or politico-religious stage in Muhammad's career was inaugurated by the Prophet's withdrawal (*Hijrah*) from his native oasis of Mecca to the rival oasis of Yathrib (thenceforward known *par excellence* as Medina: 'The City' [of the Prophet]). In the *Hijrah*—which has been recognized by Muslims as such a crucial event in the Prophet's career that it has been taken as the inaugural date for the Islamic Era—Muhammad left Mecca as a hunted fugitive. After a seven years' absence (A.D. 622–9), he returned to Mecca, not as an amnestied exile, but as lord and master, not only of Mecca itself, but of half Arabia. It will be seen that the first stage in Muhammad's career is comparable with the career of Solon¹ and the second stage with the career of Caesar.²

Peter the Great.

The drastic and effective statesmanship of Muhammad, which changed the face of the Arabian Barbarism, has its analogue in the work of Peter the Great and Lenin, who, in two successive chapters

don by a Persian expeditionary force in A.D. 608. May we conjecture that Muhammad's commercial activities were abruptly and unexpectedly cut short by these catastrophic events and that it was an enforced resumption of a sedentary life of economic inactivity in Mecca that diverted the ex-merchant's spiritual energies from the economic into the religious channel? This would explain—in so far as there can be any external explanation of a psychic event—why Muhammad's creative religious experience came to him at just this point in his life.

¹ In Part III. A, pp. 7–8, above, the Steppe has been compared to the Sea, and the life of the camel-caravanner, who conveys merchandise across the Steppe on board 'the ship of the desert', to the life of the merchant-seaman. Thus, from the technical or professional standpoint, there is an affinity between the early commercial phases of Muhammad's and Solon's careers. There is also this further point of resemblance that, in Muhammad's Arabia, this commercial life—which brought the individual or the minority that took to it into social intercourse with the Great World—was just as exotic as it was in Solon's Hellas. In Arabia *circa* A.D. 600, as in Hellas *circa* 600 B.C., commerce was the pursuit of a small minority, whose adoption of this profession was tantamount to a withdrawal from the common run of life in the surrounding society. In one respect, however, the situations of the two statesmen were different; for, while Solon the Athenian belonged to a relatively backward local community in which the merchant was a much rarer type than he was in contemporary Corinth or Miletus, Muhammad the Meccan belonged to a local community in which commerce was the prevailing economic activity—in contrast to the more primitive conditions of the rest of the Hijāz in Muhammad's day. Perhaps this difference explains why the first stage of Muhammad's career, which corresponds to Solon's career, was a failure, in contrast to Solon's success. In rustic Attica, Solon's profession had a rarity-value which must have enhanced Solon's personal prestige in the eyes of his countrymen and have thereby facilitated the accomplishment of Solon's mission. On the other hand, Muhammad the merchant had no peculiar honour in his own commercially-minded city. It is significant that Muhammad, when he had been despised and rejected at Mecca, found a welcome at Yathrib: a rustic oasis (see Margoliouth, D.S.: *Mohammed*, 3rd ed. (London 1905, Putnam), pp. 185 and 191, and the present Study, II. D (ii), vol. ii, p. 57, footnote 3, above) where an immigrant with Muhammad's Meccan commercial experience was a valued and an honoured guest. In fact, Muhammad proved himself valuable to the Yathribis not only by introducing them to political law and order, but also by teaching them to take advantage of their geographical situation in order to supplant Mecca as the half-way-house on the caravan-route between Syria and the Yaman.

² For the significance of Muhammad's political success, see further the second Annex to this chapter, on pp. 466–72, below.

of a single social revolution, have succeeded in changing the face of Russian Orthodox Christendom.

By a freakish stroke of Fortune, there was born into the purple of the Russian Orthodox Christian universal state at Moscow, on the 30th May, 1672, a genius endowed with a completely Western *êthos*—and this not even the *êthos* of his own Western contemporaries, but the *êthos* of their descendants in the sixth or seventh generation, whose time was not to come till some two centuries had gone by! Peter the Great¹ was an incomprehensible and therefore disagreeable *lusus Naturae* in the eyes of an English Bishop Burnet or a Dutch King William III, as well as in the eyes of a Russian Arch-Priest Avvakum. When Burnet met Peter in A.D. 1698, he pronounced him sordid-minded, and saw nothing more in him than a young barbarian potentate who happened to be a good ship's carpenter. When William met him, he complained that he had no aesthetic sense, and no knowledge of the Dutch language apart from a jargon of nautical technicalities. These worthy representatives of the modern culture of the West did not, and could not, guess that, in their encounter with this repulsive mechanically-minded barbarian they were being given a glimpse into their own society's future and were being shown a prototype of the typical *Homo Occidentalis* who was to adorn an age two centuries beyond their own! For us, their descendants, who have the fortune to live in these latter days, the figure of Peter has ceased to be enigmatic. We have no hesitation in placing Peter the Great in the same portrait-gallery as Edison and Ford and Rhodes and Northcliffe and Mark Twain's Yankee at the Court of King Arthur and Mr. Shaw's Straker in *Man and Superman*.

The leading traits of *Homo Occidentalis Mechanicus Neobarbarus* appear in Peter's character unmistakably, both for good and for evil. He displays an American vitality, an American impatience of pomp, an American delight in manual skill, and also an American ruthlessness.

When Peter wanted anything done, he always took the initiative by setting the example of doing the hard work himself. He worked with his own hands as a ship-wright; and, in his new Western-model Russian Army and Navy, he worked his way up the ladder of promotion from the bottom, as though he were a self-made man instead of being, as he actually was, the creator as well as the master of these two new Russian public services.² Moreover, he

¹ The account of Peter which is given here is taken for the most part from Brückner, A.: *Peter der Grosse* (Berlin 1879, Grote).

² In the triumphal procession through the streets of Moscow in A.D. 1696 with which Peter celebrated the capture of Azov—his first signal success—Peter himself marched among his comrades in the uniform of a naval captain. Compare his admiration for

280 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
chose a genuine self-made man in the person of Menshikov to be his Russian right-hand man (his other principal coadjutors were imported Westerners). He threw off the Byzantine ceremonial of the Muscovite Court¹ and preferred to live at ease: not only among the relatively cultivated Western merchants and professional men in the German suburb of Moscow,² but also among his Western craftsmen at Preobrazhensk. (At Zaandam in Holland, which he visited on his Western tour, he stayed in the house of an artisan whose acquaintance he had made in Russia.) His method of visiting the West was to send his Swiss adviser Lefort on a diplomatic mission to the Western Courts and then to travel incognito in his own ambassador's suite as one of a party of naval apprentices. As for his mechanical bent, he had already learnt the use of all manner of tools and mechanical apparatus by his twelfth year, before ever he had stirred abroad. In 1697 the Kurfürstin Sophie Charlotte of Brandenburg found him master of no less than fourteen trades; he took the opportunity of his visit to the West to add dentistry and etching to his accomplishments and to make some study of anatomy; and he astonished the Saxon Court by his technical knowledge of artillery. The most 'American' of all Peter's traits was the combination of this manual ability with the lynx eye of the prospector and the entrepreneur. When he temporarily occupied the Caspian Provinces of Persia in 1722-3 his first step was to organize a systematic inquiry into their natural resources; and he himself divined the commercial future of coal in an age when coal was as yet of no account at Newcastle. More remarkable still, a passing visit to Baku in the course of a military campaign revealed to Peter's uncannily perspicuous vision the future of mineral oil!³
It will be seen that Peter was a *lusus Naturae* in two degrees. He was a Westerner born into Russian Orthodox Christendom; and he was a Westerner born into the World two centuries before the West itself succeeded in producing human beings of Peter's type. When we have added that Nature endowed Peter with genius and that Fortune placed in his hands the autocratic government of a great state, we shall find that we have left ourselves only one historical figure with whom Peter can be treated as comparable, and that is Ikhnaton.

Ikhnaton, inheriting despotic power in a society in which he was a spiritual stranger, attempted to remake Society in his own image and ended in utter failure. Peter, attempting the same *tour* English simplicity in dress, which comes out in the anecdote cited in III. C (i) (c) on p. 179, footnote 2, above.

¹ Throughout his reign, Peter restricted himself to a modest personal income.

² This suburb was known in Russian as 'the Svoboda' or 'free town'. The proportion of self-made men among its bourgeoisie was high. For its *éthos*, see vol. ii, p. 232, above.

³ See II. D (vii), vol. ii, pp. 278-9, above.

de force in the same circumstances, achieved a resounding success. What accounts for this extreme difference between the fortunes of these two historic human 'sports'? Partly, no doubt, the difference in temperament (for in temperament, as opposed to circumstances, Peter and Ikhnaton were poles apart). There is, however, another factor which was manifestly of the utmost importance in Peter's career and which was lacking in Ikhnaton's career; and this factor is the movement of Withdrawal-and-Return. Ikhnaton did indeed withdraw from the Egyptiac Society into the enchanted palace which he conjured up for himself at Tell-el-Amarna. But, once within the precincts of this asylum, he could never bring himself to face the return to reality. Peter likewise withdrew from the alien Orthodoxy of Russia into the Western World towards which he was drawn by spiritual affinity; but his whole absence in the West, on the momentous tour of A.D. 1697-8, only lasted eighteen months; and the absentee autocrat cut his travels short, upon the news of the outbreak of the Streltzy, in order to return to Russia post-haste and crush the mutineers. Moreover, the Peter who returned to Russia in the autumn of 1698 was a different man from the Peter who had left Russia less than two years before.

The change in Peter which actually took place is symbolically described in a Russian fairy-tale. On the Western tour, as the tale is told, the real Peter disappeared;¹ and the man who came back to Russia in 1698 was neither Peter nor indeed a real man at all, for he was none other than Antichrist in Peter's shape! There is more in this fairy-tale than the naïve peasants who tell it comprehend; for Peter really did return with a life-work to carry out which is aptly described as the work of Antichrist from the standpoint of Russian Orthodox Christendom. When he left Russia for the West, Peter was still just a boy who had found his hobby in carpentry and had applied this hobby, when Fortune gave him the power, to building himself a navy and building it on Western lines because those lines happened to be technically the best. If this gifted boy had simply stayed at home, immersing himself in his hobby and making himself an *enfant terrible* to the conservative Byzantine Court which was his native social milieu, he might well have met the same untimely and violent end as Scyles the Scythian;² and his vagaries would certainly have had no greater effect

¹ He is said to have disappeared in Sweden—a country which he did not actually visit—but the Sweden of the fairy-story is a mythical German Kingdom which is ruled by a virgin—a wraith, perhaps, of the famous Queen Christina (*regnabat* A.D. 1633-54).

² Scyles (*florebat circa* 450 B.C.) was the prince of a Scythian Nomad horde which ranged the steppes in the hinterland of the north coast of the Black Sea. Through the Greek colonies planted on this coast, Scyles made the acquaintance of the Hellenic Civilization, and he fell in love with it. For a time he led a double life—living part of the year, unknown to his fellow-Nomads, in the Greek city of Borysthene in Greek clothes and in the Greek manner, with a Greek wife. (Compare Peter's visits to 'the

than those of Ikhnaton upon the subsequent course of history. The very different course which Peter's life-history actually took was the outcome of his brief Western tour of A.D. 1697-8—as far as it can be ascribed to any external event. At any rate, Peter returned to Russia from this tour with his mental horizon immensely widened and with his mind made up to carry out a design which might seem to be beyond the compass of any one man's powers but which, nevertheless, was the one possible way of safeguarding 'the changeling's' own personal fortunes. Peter returned with the resolve to make life possible for Russia in the contemporary World—and, incidentally, to make life possible for Peter himself in Russia—by bringing this derelict remnant of Byzantinism into the comity of Western nations as one of the Great Powers of the Western political system.

This broadening of Peter's aim can be discerned in those records of his Western tour that have come down to us. The interests that took him abroad in 1697 were not social and political but technical. Out of his eighteen months in Western Europe, he spent nine on improving his knowledge of the technique of ship-building. He worked for five months and a half on a frigate that was under construction in the Dutch Admiralty dockyard at Amsterdam; and he went on from Holland to England because the Dutch naval designers were not sufficiently scientific in their methods to satisfy him! The impression which he made, in England, upon King William and Bishop Burnet has been described already. Yet a broadening of outlook is indicated by the fact that, in England, Peter sometimes turned aside from his technical pursuits in order to attend Anglican church services and Quaker meetings; and such indications are confirmed by his action after his return, when he launched his campaign of Westernization along the whole front of the battle-ground between his own subversive personality and the traditional social life of Russian Orthodox Christendom. On every sector of this front, he took the offensive and won a victory. He overcame the Streltzy,¹ he overcame the Boyars,² he overcame the

Svoboda', and his ten-years-long liaison with Anna Mons.) When the Nomads discovered their prince's secret Hellenism, they did him to death. The story is told by Herodotus in Bk. IV, chs. 78-80.

¹ The Streltzy were destroyed by Peter in A.D. 1698-9. In non-Western communities that have entered upon the path of Westernization, the destruction of a turbulent and inefficient 'Old Guard', in order to make room for a new-model army on the Western pattern, has been a common first step in the campaigns of political Westernizers. Compare the destruction of the Mamlûks in Egypt by Mehmed 'Ali in A.D. 1811 and the destruction of the Janissaries in Turkey by Sultan Mahmûd II in A.D. 1826. The exception which proves the rule is the voluntary renunciation of traditional privileges in Japan by the Daimyos and their Samurai in A.D. 1868-9. For these phenomena, see further Part IX, below.

² The noble cadets attached to Lefort's suite (of whom Peter himself was one!) were given exacting instructions to master certain particular Western techniques. If they did not bring home satisfactory evidence that they had done what had been laid upon them,

Byzantine social tradition,¹ he overcame the Orthodox Church,² and he overcame the Swedes.³ This astonishing list of victories is a summary of Peter's life-work; and this life-work was a sequel to his withdrawal-and-return in A.D. 1697-8.

Lenin

Withdrawal-and-Return is likewise the key to the career of

they were to forfeit their estates! Peter even went so far as to prohibit any nobleman from marrying until he had passed an examination in geometry, arithmetic, and navigation! Moreover, all hereditary boyars were conscripted by Peter for a lifelong term of compulsory public service—and this without even the compensation of being given a monopoly of the field. For at the same time the public service was thrown open to all classes; and self-made men were automatically ennobled upon the attainment of quite modest ranks in the new political hierarchy. More than that, the Russians of all classes in Peter's service were subordinated to the imported Westerners, of whom more than a thousand were engaged on long-term contracts during the Western tour of A.D. 1697-8. It will be seen that Peter passed his boyars under the harrow, without mercy.

¹ Peter's declaration of war upon the Byzantine social tradition was delivered in his celebrated gesture of shaving, with his own hand, the beards of the grandees who came to congratulate him on his return from the West in A.D. 1698. A ukase of the 4th January, 1700, made the wearing of Western dress compulsory by a certain date 'for the glory and beauty of the State and the improvement of the Army'. This was confirmed in a second ukase of the 20th March, and detailed instructions were issued in 1701. Compare Mehmed 'Ali's imposition of Western uniforms upon his troops, and Mustafâ Kemâl's imposition of Western dress upon the entire male civil population. (The compulsory change of dress which was carried through by Peter in Russia was confined to the upper class, and the obligation to shave might be bought off by the payment of a beard-tax.) Peter, however, was not content with imposing Western dress. He arranged for the compilation of elaborate manuals of Western fine manners; and in the houses of the nobility in the new capital, Petersburg, 'receptions' *à la française* were organized by the Police.

² Peter re-converted the Orthodox Church in Russia into the docile instrument of state which had been the church's function in the minds of Peter's Byzantine precursors Constantine the Great and Justinian the Caesaro-papist and Leo the Iconoclast; but Peter's model in this matter was probably the contemporary practice in the Protestant countries of the Western World rather than the original practice in Orthodox Christendom itself. In A.D. 1690 (just on the morrow of his effective accession to power) Peter failed to secure the election of his own well-educated and progressive candidate, the Metropolitan Marcellus of Pskov, to the Patriarchate of Moscow. But when the Patriarchate fell vacant next time, which happened in 1700, Peter deliberately left it vacant for 20 years, until 1721, when he substituted for the Patriarchate, as the supreme authority over the Russian Orthodox Church, a Holy Synod which was simply a secular department of the Petrine State. The measure of Peter's victory over the Orthodox Church is given by the fact that he attended Protestant and Catholic church services, not only abroad, but in 'the Svoboda' under the very walls of Moscow. In a prospectus, issued in 1702, inviting foreign experts to come to Russia—a document which was printed in German and was circulated in the West—Peter gave an express and explicit guarantee of religious toleration. (Text of the relevant passage in Brückner, *op. cit.*, p. 204.)

³ Having realized Russia's need to acquire a seaboard, Peter began, in A.D. 1695-6, with the relatively easy conquest of Azov from the Turks. It is significant that, after his return from the Western tour of A.D. 1697-8, he addressed himself to the far more formidable task of conquering the Baltic Provinces from the Swedes, and persevered in this arduous enterprise for twenty years (A.D. 1700-21) until he finally achieved his aim. He had come to the conclusion that a seaboard on the Baltic was worth acquiring at any price because it would open the door for direct intercourse between Russia and the West. (For the significance of the new capital which Peter founded on the Neva, see II. D (v), vol. II, pp. 157-8, above.) On the other hand, the conquest of Azov was not worth following up, because the further passage from this port to the open sea was blocked by the Ottoman Government's control of the Straits of Kertch and of the Bosphorus and of the Dardanelles. And even if the Russian ships had been able to run the gauntlet of these three successive 'Symplegades', they would have merely found themselves at large in the Eastern Mediterranean—a sea which, in Peter's day, before the opening of the short-cut from the Atlantic to the Indian Ocean, was a sluggish backwater, remote from the principal ocean-highways of the World.

284 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
 Lenin:¹ the second Russian 'Antichrist' whose intention it was to undo, and whose achievement it has been to consummate, the work of Westernization which was originally initiated by Peter.² Born in 1870, Lenin entered, in 1893, upon the conventional revolutionary career of the Russian intellectual of his generation: an abortive agitation which ended in 1897 in banishment to Siberia. It was after his withdrawal from Russia to Switzerland in 1900, after his Siberian sentence had been served out, that Lenin came to know his own mind and began to impose his will upon the minds of his fellow revolutionaries. He came to the front in 1903, when a conference of Russian Marxian Socialists in exile, which was held that year in Brussels and London, resulted, by reason of Lenin's masterful intransigence, in the historic split of the Russian Marxian Socialist Party into the two sects of Minoritarians (*Mensheviki*) and Majoritarians (*Bolsheviki*). From that time onwards Lenin, as leader of the 'majoritarian' Bolshevik faction in the Russian Marxian Socialist camp, continued to gain in authority and prestige through the long course of an absence from Russia which extended, from first to last, from 1900 to 1917. And though this potent exile's first return missed fire in the failure of the abortive Russian Revolution of 1905-7,³ his second return, when he appeared again in Russia from the West on the 4th April, 1917, will assuredly rank as one of the decisive events in the history of our Western Civilization and perhaps in the history of Mankind, as well as in the history of Russia. After twenty-four years of revolutionary work, of which some eighteen years had been spent at work in exile in Siberia and Europe, Lenin now returned, with seven more years of life before him, to carry out his tremendous life-work. Before he died in 1924 he had made himself master of the territory and population and resources of the *ci-devant* Russian Empire; and he had turned this mastery to account in order to put in hand—with a ruthlessness equal to Peter's—the great experiment of translating the Marxian Utopia into real life on the grand scale.

Garibaldi

Before we pass on from the 'practical men' to the 'intellectuals', we may observe the Withdrawal-and-Return *motif* appearing again in the careers of two famous Western heroes of the modern age: Giuseppe Garibaldi (*vivebat* 1807-82) and Paul von Hindenburg (*vivebat* 1847-1934).

¹ See Mirsky, D. S.: *Lenin* (London 1932, Holme Press).

² For the function of Bolshevism as an instrument of Westernization, see III. C (i) (d), pp. 200-2, above.

³ On this occasion, Lenin returned to Russia in November 1905 and withdrew again in December 1907.

The first chapter in Garibaldi's career is not unlike the first chapter in Lenin's. Born in 1807, Garibaldi entered, in 1833, upon the conventional revolutionary career of the post-Napoleonic Western Liberal: an abortive conspiracy against the régime of the Restoration, which ended in the conspirator's ignominious flight from the territory of the Sardinian Government instead of ending in the Government's overthrow. The next stage in Garibaldi's life-history recalls a stage which has come to our notice in the life-history of Philopoemen. As the young Philopoemen withdrew for ten years from his native Peloponnese in order to practise the arts of war and statesmanship overseas in the training-school of Crete, so the young Garibaldi now withdrew for twelve years (1836-48) from his native Italy in order to learn the same perennial arts in the New World of Latin America. It was in a Latin-American war between the Republic of Rio Grande do Sul and the Empire of Brazil that Garibaldi won his spurs as a guerilla leader; and it was in another Latin-American war—this time between Monte Video and Buenos Ayres—that he recruited the nucleus of his Italian 'Red-Shirts'.

'[The] Italian Legion of Monte Video was the origin of the Garibaldians proper. It was the first considerable body of his countrymen whom he ever commanded on land; most of the men were political exiles; it was they who first wore the famous "red shirt"; and those of them who came back with him to Europe in 1848 imported the Garibaldian dress, tradition, and methods in war and politics. The idea with which they enlisted was to fight for the liberties of Monte Video in return for the shelter it had given them, refusing all rich rewards; but the idea behind was to prepare for another struggle, which, as Garibaldi said, he had never forgotten even "in the depths of the American forests".'¹

Thus, when the news of the European Revolution of 1848 reached the opposite shores of the Atlantic, Garibaldi in Monte Video was ready for the call to enter upon his life-work. As they sailed homewards across the ocean in order to turn their prowess to account in fighting for the liberation of Italy, the returning hero and his companions 'knew that they were going "towards the attainment of the passion and desire of their lives"'.² And the People of Italy, on their part, were already aware of what Garibaldi's life-work was to be,³ before ever he re-entered the country which he had left, twelve years before, as an obscure and defeated fugitive. Garibaldi's fame had outstripped Garibaldi himself and

² Trevelyan, *op. cit.*, p. 40.

³ Read the anecdote recounted by Trevelyan in *op. cit.*, on pp. 39-40.

come home to Italy before him. 'Already the names of Garibaldi and his Italian Legion were household words'¹ as far afield as Rome. In the chapter of his life-history which began when he once more set foot on Italian soil in 1848, Garibaldi stepped straight into that place in the hearts of his countrymen and in the history of his age which he was to occupy from that time onward.²

Hindenburg

As for Hindenburg, in the summer of 1914 he was already some four years older, at the age of 67, than Garibaldi had been at the time when the task which had been Garibaldi's life-work was carried to completion by the entry of the Italian troops into Rome in the autumn of 1870. And yet, at the outbreak of the General War, the life-work of Hindenburg had not really begun. Born in 1847, and born the son of a Prussian officer, he had almost automatically embraced his father's profession and had passed in his turn through the conventional career of a Prussian officer from start to finish. Nor had his career been particularly eventful; for, while he had come to manhood just in time to serve in the campaigns of 1866 and 1870-1, the whole of the rest of his time of service had elapsed in a period of unbroken peace, until he had been placed on the retired list in his sixty-fourth year as a worthy but undistinguished General Officer. Yet this retirement, which seemed to write 'finis' upon his record, was destined to last for no longer than three years. On the 22nd August, 1914, less than a month after the outbreak of the General War, von Hindenburg re-emerged from his retirement at Hanover, and entered upon his life-work, when he rescued East Prussia from her Russian invaders. For this was the first step in a new career which culminated in the command of the whole German Army on all fronts; and the veteran Generalissimo justified the trust which had been placed in him by his countrymen in the stress of national danger when he stood by his troops at the moment of débacle instead of running to earth on neutral soil at the heels of his sovereign and his chief-of-staff. Thereafter, when the fighting had ceased and the armies had been demobilized, von Hindenburg retired to Hanover for the second time in July 1919, and remained in retirement this time for twice as many years as before, until his countrymen summoned him out of retirement once again by electing him President of the German Reich in April 1925. Thereupon, at the age of seventy-seven, the veteran entered

¹ Trevelyan, *op. cit.*, loc. cit.

² Compare the life-history of Hereward the Wake, who left England before the Norman Conquest as a young sprig seeking his fortune on the Continent, and returned to England after the Norman Conquest to step at once into the position of being the one Englishman who knew how to defy the Conqueror.

upon a third career in which he was required to bear the highest responsibility in an unfamiliar field of action. In this remarkable life, the *motif* of Withdrawal-and-Return has asserted itself at the eleventh hour in order to transform the retired Prussian officer of 1911 into the Pater Patriae of 1925 by miraculously adding a cubit to an old man's stature.

A Pleiad of Historians

If we pass on now, in our survey, from the lives of soldiers and statesmen to the lives of historians and poets and philosophers, our attention will first be attracted by a Pleiad of historians—Thucydides and Xenophon and Polybius; Josephus and Ibn Khaldūn; Machiavelli and Clarendon and Ollivier—who have started life as soldiers or statesmen and have made the transit from one field of action to another in their own life-histories by returning as historians to a world from which they have previously been expelled as prisoners-of-war or deportees or exiles.

Born into their social milieux in generations whose fortune it has been to encounter tremendous challenges and to live through momentous experiences, these eventual observers and recorders of the histories of their own times have all begun their careers by taking a hand in 'practical affairs': participating, that is to say, in the direct interactions between individual human wills in which current history works itself out. This original orientation of their energies towards 'practical' action may have been determined by different causes—by inward inclination or by external accident—but in every case the effect upon their activities has been the same. So long as they have been swept along in the stream of 'practical' action into which they have stumbled or plunged, they have found no occasion for exercising their latent historical abilities. In each of these lives, the occasion has been offered by some accidental breach in the future historian's career as a 'practical man'; and, here again, the effect of this compulsory abandonment of their original role in Society has been the same, whether the reversal of fortune has been greeted by the victim of it as a welcome relief from an onerous public duty or has been endured as a painful banishment from a field of action for which the exile's heart has never ceased to ache. As it happens, these opposite personal reactions to the break are illustrated in the respective attitudes of those two members of our historical Pleiad who have attained the highest distinction in the 'practical' sphere—the only two, in fact, who would undoubtedly have made their mark in history as statesmen if Fortune had allowed them to hold their ground in the political field from beginning to end and had never compelled them to

withdraw in order to make their mark otherwise by turning their historical talents to account. Yet in Clarendon's and in Machiavelli's life alike, the break in the career has actually been the making of it; and this apparent paradox applies *a fortiori* to the life of Thucydides, who lives on in living minds to-day as a greater historian than either of these, although there is no indication that he would ever have emerged from obscurity if his service as a soldier in the 'Twenty-Seven Years' War had continued to the bitter end. Without exception, every member of our Pleiad has made a greater mark and achieved a greater distinction in the last chapter of his career, which has opened with his return as an historian, than he would ever have achieved if the first chapter had not been cut short by his withdrawal as a defeated general or a fallen minister of state.

In these eight broken lives we have a conspicuous example of that process of 'etherialization' which we have taken as our criterion of growth. In the 'practical' first chapter of their careers, these future historians have all set themselves to produce an effect upon their fellow men by the obvious and crude and finite 'direct method' of bringing their wills to bear upon the wills of their neighbours. The compulsory withdrawal, which has inhibited the exercise of their activities on this 'practical' plane, has compelled them to find a new vent by transferring their action to another plane and transmuting their energies into a new medium. In prison or internment or exile, the energies that can now no longer discharge themselves in the impact of will upon will have been transmuted from will-power into a heightened intensity of perception and thought and imagination and feeling; and, in virtue of this transfiguration, the same energies have been able, in the fullness of time, to return to action by evoking an answering note of heightened perception and thought and imagination and feeling in the souls of other human beings. On this higher plane, and through this more etherial medium, action duly begets action in the end, as it does when will strikes will; for the heightening of perception and thought and imagination and feeling cannot take place without producing some tension in the will of the personality that enjoys the experience. In this subtler form of interaction, however, the second will responds to the first by a spontaneous movement that arises from within, and not under a duress that has been imposed upon it *more mechanico* or *manu militari*.

This new form of action on a new plane has been made possible by the employment of a new method of expression and approach. The *ci-devant* soldiers and statesmen who once produced an effect on their fellow men by the direct exertion of will-power, have been

taught by Necessity to invent the alternative method of creating works of art; and, just because it is more etherial, this alternative method is also more effective. It is more effective in the double sense of being wider in its range and of going deeper in its penetration. For the influence of soul on soul that is transmitted through the medium of will-power is as narrow and as superficial as it is sensational. In every kind of action, the agent's scope is limited by the nature of his field; and the scope of the 'practical' man of action is bounded by the confines of the personal and institutional relations through which he is operating. It is only when human action is transmuted—by the purging out of all its human passion and its human *animus*¹—from the gross medium of will into the etherial media of perception and thought and feeling and imagination, that it is able to transcend all limits of Time and Space and to win its way into a field that extends to Infinity.

Let us search, in our own time and place, for vestiges of the living presence of Thucydides and Xenophon the Athenian soldiers, or Polybius the Megalopolitan statesman, or Josephus the defender of Jotapata, or Ibn Khaldun the vizir and the *qādi*, or Machiavelli the Secretary to the Signoria of Florence, or Clarendon the mentor and minister of Charles the First and Charles the Second, or Ollivier the minister of Napoleon III. Search as we may, we shall not find one vestige of life to-day in any of these souls in their original 'practical' capacities. In these capacities, their only monument is Shirley's remorseless stanza:

Some men with swords may reap the field
And plant fresh laurels where they kill;
But their strong nerves at last must yield:
They tame but one another still.
Early or late
They stoop to Fate
And must give up their murmuring breath
When they, pale captives, creep to death.

It is the break in their careers that has saved these abortive soldiers and statesmen from a Caesar's or Napoleon's fate by compelling them to withdraw from the field of 'practical affairs' in order to return to action on the plane on which they have achieved their immortality.

Ergo vivida vis animi pervicit, et extra
Processit longe flammantia moenia mundi
Atque omne immensum peragravit mente animoque.²

¹ For purgation (*κάθαρσις*) as the function of the Hellenic art of tragic drama, see Aristotle's famous definition of Tragedy in the *Poetics*, vi. 2 (1449 B).

² Lucretius: *De Rerum Natura*, Bk. I, ll. 72-4, quoted already in II. C (ii) (b) 1, vol. i, on p. 299, above.

If we search now for Thucydides and Xenophon and Polybius and Josephus and Ibn Khaldūn and Machiavelli and Clarendon the historians, we shall find each one of them just as much alive and just as effectively in action in his etherial communion with posterity as ever he was in his 'short and narrow-verged' life in the flesh. As creative artists, these *ci-devant* soldiers and statesmen are proof against Shirley's taunt:

The garlands wither on your brow;
Then boast no more your mighty deeds.

They can answer in the language of Wren's epitaph *Si monumentum requiris circumspice*¹ or in the language of Horace's ode *Non omnis moriar*.² For, in withdrawing on one plane to return on another, they have found life in losing it;³ and their action sweeps on, immortal and infinite.

O love, they die in yon rich sky,
They faint on hill or field or river:
Our echoes roll from soul to soul
And grow for ever and for ever.

This is the spiritual significance of the *motif* of Withdrawal-and-Return as it manifests itself in the lives of our Pleiad of historians. At a later point in this Study, when we come to consider the inspirations of historians,⁴ we shall have to examine this particular type of Withdrawal-and-Return once again for the sake of the light which it may be found to throw upon the nature of the historian's art. For the purpose of our present inquiry, we have merely to review the circumstances in which each of these eight withdrawals and returns took place.

On a comparative view, these eight lives fall into three groups. In five of them—the lives of Thucydides and Xenophon and Josephus and Ollivier and Machiavelli—the *motif* appears in its simple form. The break which cuts short the chapter of 'practical' action concludes it once and for all, and the chapter of literary activity fills the rest of the life to the end. In two other lives—the lives of Polybius and Clarendon—the pattern is more complicated. Instead of there being only one break, there are two or three; and the periods of 'practical' and literary activity are interwoven in a series of alternate chapters. Finally, there is the life of Ibn Khaldūn, in which a single short period of literary activity is followed, as well as preceded, by a long period of immersion in 'practical' affairs—the posterior period of 'practical' activity lasting, in this case, right down to the philosophic qādi's death.

⁴ This is the subject of Part XIII, below.

Thucydides

Thucydides (*vivebat circa* 454-399 B.C.) was a citizen of Athens who lived through the Twenty-Seven Years' War of 431-404 B.C., and who was overtaken by the outbreak of the war in his early manhood. He thus belonged to a generation which was just old enough to have known the pre-war Hellenic World as an adult member of the pre-war society; and at the same time he lived long enough to see the denouement of the great catastrophe that brought the growth of the Hellenic Civilization to an end and set in motion the long and tragic movement of decline and fall. The definite breakdown of the Hellenic Civilization was, in fact, the challenge which the generation of Thucydides had to encounter and the experience through which they had to live; and Thucydides was fully alive to the significance of the catastrophe. 'This war', he says in the preface to the first part of his work,¹ 'was . . . the greatest upheaval ever experienced by Hellas and by a part of the non-Hellenic World (it would hardly be an exaggeration to say: by the Human Race)'; and he informs his readers in the same passage that, 'in the belief that this war would eclipse all its predecessors in importance, he began to write as soon as war broke out'. In the Athens, however, of Thucydides' day an able-bodied adult male citizen was constrained in peace-time, and *a fortiori* in war-time, to devote the best part of his time and energy to public service if the State made the demand; and we may suppose that, as soon as war broke out, this 'practical' demand upon Thucydides became exacting. At any rate, in the eighth year of the war, we find Thucydides serving as one of the ten Athenian Generals: a board of public officers, elected annually for a twelve months' term, who exercised the chief executive authority in the civil government in addition to their command over military operations.

It was in this position of 'practical' responsibility, which Thucydides held in 424-423 B.C., that he suffered the break in his career which was the turning-point in his life-history. In the winter of 424-423 B.C., when Thucydides was in command of an Athenian naval squadron stationed at Thasos, he failed to prevent a Lacedaemonian expeditionary force commanded by Brasidas from capturing Amphipolis. The lost fortress was a key-position, since it commanded the passage across the River Strymon on the land-route leading from Continental Greece towards the Dardanelles:

¹ Thucydides' *History of the Twenty-Seven Years' War* is in two parts, each introduced by a preface. The preface to Part I = Bk. I, chs. 1-23; the preface to Part II = Bk. V, chs. 25-6. Part II is unfinished. (The work was apparently interrupted by the author's death.) The narrative breaks off abruptly in the middle of the record of the twenty-first year of the war (411 B.C.) out of the total of twenty-seven years (431-404 B.C.) which the author intended to cover.

the only route along which it was possible for the Peloponnesians to strike, with their superior land-power, at a vital point in the Athenian Empire, so long as Athens retained her command of the sea. The Athenian People sought relief for their feelings of chagrin and alarm at the news of this reverse by cashiering Thucydides and sentencing him to exile. And it was thanks to this personal mishap to Thucydides the soldier that Thucydides the historian at last obtained the opportunity to accomplish his life-work.

'I lived', he writes in the preface to the second part of his work, 'through the whole of [the Twenty-Seven Years' War], and I was not only of an age of discretion, but I took special pains to acquire accurate information. It was my fate to be exiled from my country for twenty years after my command at Amphipolis; and in this situation I was enabled to see something of both sides—the Peloponnesian as well as the Athenian—and to make a special study of the War at my leisure.'

Thanks to this fortunate misfortune, Thucydides was able to complete rather more than two-thirds of his projected work,¹ though he seems to have died a premature death before he was out of his fifties. What is more, he has triumphantly achieved his ambition, declared in the preface to the first part of the work, to produce 'an everlasting possession'—a permanent contribution to knowledge—'rather than an ephemeral *tour de force*'. In his own austere intellectual way, this cashiered Athenian officer has anticipated the injunction

'Lay not up for yourselves treasures upon Earth, where moth and rust doth corrupt, and where thieves break through and steal;

'But lay up for yourselves treasures in Heaven, where neither moth nor rust doth corrupt, and where thieves do not break through nor steal;

'For where your treasure is, there will your heart be also.'²

The passing agony of one unhappy generation of Hellenes who dealt their own Hellas a mortal blow and knew that her blood was on them and on their children³ has been transmuted by Thucydides, in a great work of art, into an ageless and deathless human experience.

Xenophon

Xenophon was the continuator of Thucydides' work; and he carried on the tale of ruin, from the point at which Thucydides' narrative broke off, for another fifty years,⁴ until he, too, dropped his pen

¹ The title of Part II, as given by the author himself in the preface to this part, is: 'The History of the Second Phase of the War down to the Overthrow of the Athenian Empire by the Lacedaemonians and their Allies and the Occupation of the Long Walls and the Peiraeus.'

² Matt. vi. 19-21.

⁴ Xenophon's *Hellenica* covers the years 411-362 B.C.

³ Matt. xxvii. 25.

from a hand which was arrested, not by the accident of death, but by the inward inhibition of despair.¹ Born an Athenian citizen in a generation which did not come to manhood until the Twenty-Seven Years' War was in full swing, and which therefore was inclined to take the state of war for granted, Xenophon can scarcely have seen his first military service until some time after Thucydides had seen his last;² and his experience of the Atheno-Peloponnesian War did not sate Xenophon's appetite for the military career. After the restoration of peace in Hellas he went off to seek his fortune in the service of Cyrus the Lesser: a young pretender to the Achaemenian throne; and this gratuitous military adventure—on which Xenophon embarked against the advice of his mentor Socrates³—resulted, as Socrates had feared, in Xenophon's being penalized at Athens by a sentence of banishment;⁴ but this political mishap simply impelled the incorrigible soldier of fortune to find a new opening for military adventure by irrevocably throwing in his lot with the Spartans. He attached himself to the staff of King Agesilaus, and was actually present, in the Spartan king's suite, at an important engagement in which his own Athenian countrymen were on the opposing side.⁵

It was after this, when Xenophon was perhaps some ten years older than his predecessor Thucydides had been when he retired, after his banishment, to his Thracian asylum at Scaptê Hylê, that at last the change took place in Xenophon's life which transformed Xenophon the soldier into Xenophon the author. The Lacedaemonian Government now showed its appreciation of Xenophon's services by endowing him with an estate at Scillus, a quiet, rural neighbourhood in the Peloponnese;⁶ and at Scillus Xenophon lived in peace and wrote at leisure for some twenty years, until eventually

¹ After recounting the Battle of Mantinea which was fought in 362 B.C., and in which Xenophon's own son met his death as well as the great Theban statesman Epaminondas (the one man of his generation who might conceivably have saved Hellas, if his life had been spared), Xenophon winds up his history with the following sentence: "There was more unsettlement and disorder in Hellas after the battle than before it—but I do not propose to carry my narrative further, and will leave the sequel to any other historian who cares to record it" (Xenophon: *Hellenica*, Bk. VII, *ad fin.*). The bitterness of this sentence comes with peculiar pungency from the pen of a writer with Xenophon's placid temperament.

² Xenophon is said to have been in action, in the summer of 424, at the Battle of Delium, and to have had his life saved on this occasion by Socrates. This story, however, is probably apocryphal; and Xenophon was perhaps some ten years younger than the story assumes.

³ See Xenophon's own account of this incident in his *Cyri Anabasis*, III. i. 4-8.

⁴ The decree of banishment appears to have been issued against Xenophon in 399 B.C., the same year in which Socrates was put to death. His final offence, in the eyes of his own Athenian countrymen, seems to have been his action in inducing the remnant of his ten thousand fellow-Greek mercenaries, after their catabasis from Babylonia to the Aegean, to take service with the Spartan commander Thibron in his operations against the Achaemenian Power in western Asia Minor.

⁵ The Battle of Coronea, fought in 394 B.C.

⁶ See Xenophon's own charming description of his estate at Scillus in *Anabasis*, v. iii. 7-13.

he was expelled by the Eleans after the downfall of his Lacedaemonian patrons.¹ It was those twenty years in Scillus that ensured the achievement of Xenophon's life-work.

Josephus

Josephus was a Jew who lived through the Romano-Jewish War of A.D. 66-70, and who was overtaken by the outbreak of the war in his late twenties.² Born into a distinguished family of the hereditary Jewish priesthood, and brought up at Jerusalem in the traditional Jewish culture,³ Josephus was old enough to have known the pre-war Jewish life in Palestine as an adult member of the pre-war society; and at the same time he lived to witness the great catastrophe which ended in the destruction of the Palestinian Jewish community root and branch, and which thereby reduced Jewry to a mere diaspora.⁴ The Great Romano-Jewish War of A.D. 66-70 was the last and the decisive bout in a long-drawn-out combat which had opened with the armed insurrection of the Maccabees against the Seleucid Power in 168 B.C. This Jewish attempt to resist the impact of Hellenism by force of arms had been a forlorn hope from the outset; and the tragedy of the inevitable outcome was only heightened by the accidental prolongation of the unequal struggle over a period of little less than two and a half centuries.⁵ The annihilation of the Palestinian Jewish community through the knock-out blow which was delivered, in the end, by the military power of Rome, was the experience which had to be endured by Jewry in the generation of Josephus; and Josephus writes of this great Jewish catastrophe in terms that recall Thucydides' description of the great Hellenic catastrophe of 431 B.C. 'The Judaeo-Roman War', he says in the opening sentence of the preface to his history of it, 'is the greatest war of our own times, and it would hardly be an exaggeration to add that it is the greatest of any wars on record between either city-states or nations.'⁶

In the early part of the war, Josephus, like Thucydides, participated as a combatant; and, like Thucydides again, he was com-

¹ The Eleans were former allies of the Lacedaemonians who had shown themselves recalcitrant and had therefore been chastised by the Lacedaemonian Government in 398-397 B.C. as soon as the downfall of Athens had set Spartan hands free to attend to minor matters. Scillus was a former possession of the Eleans which had been taken from them by the Lacedaemonians on this occasion. The Eleans promptly resumed possession after the Lacedaemonian *débâcle* at Leuctra in 371 B.C.

² See Josephus's *Autobiography*, chs. 3 and 4 and 15.

³ See Josephus, *op. cit.*, chs. 1 and 2. He records that, between the ages of sixteen and nineteen, he spent three years in self-mortification in the Wilderness, as the disciple of an ascetic anchorite, as a prelude to becoming a Pharisee.

⁴ See II. D (vi), vol. ii, p. 236, and II D (vii), vol. ii, pp. 285-6, above.

⁵ The militant anti-Hellenic reaction of Jewry in Palestine was respite by a series of accidents: the overthrow of the Seleucidae by Rome; the rise of the Arsacid Power east of Euphrates; and the adroit temporizing policy of the Herods.

⁶ Josephus: *The Romano-Jewish War*: Preface = Bk. I, chs. 1-16.

pelled to change his role by the fortune of war, which broke his military career and thrust him into the position of an observer who was penalized in one sense and privileged in another. Josephus was penalized in the sense that the circumstances in which his change of fortune came about were such as to produce a moral breach between the prisoner-of-war and his own people, in whose eyes he was a traitor to the Jewish cause.¹ He was privileged inasmuch as he won the confidence and esteem and patronage of Vespasian—the Roman commander in Palestine who rose, while the war in Palestine was still in progress, to be the lord and master of the Roman World. When the war was over and the last embers of the great conflagration had been stamped out, Josephus left Palestine for Rome in the same ship as Vespasian's son and lieutenant and successor Titus; and in Rome he settled down in comfort² to his life-work of writing *The History of the Romano-Jewish War* and *The Ancient History of the Jews* and the other historical and controversial works through which he lives to this day. Josephus's own account of the stroke of Fortune which turned Josephus the soldier into Josephus the historian is given in the following terms:

'By descent I am a Hebrew from Jerusalem, by profession a priest. I saw service against the Romans in the initial phase of the War, and was a compulsory spectator of its latter stages.³ . . . My own record of the War as a whole and of the incidental details is correct, since I was a first-hand witness of all the events. I was in command of our Galileans so long as resistance was possible, while after my capture I was a prisoner with the Romans. Vespasian and Titus compelled me to remain in constant attendance upon them under guard, at first in chains, though afterwards I was released and was sent from Alexandria, on the staff of Titus, to the siege of Jerusalem. During this period nothing was transacted that escaped my observation. The events in the Roman camp I sedulously recorded at first hand, while I was the only person present who could understand the reports of the deserters from the

¹ Josephus became a prisoner-of-war in the campaign of A.D. 67 upon the capture of the Galilaean fortress of Jotapata, of which he had been the commandant. During the siege of Jotapata and in the earlier operations in which he had taken part, Josephus had shown himself an energetic and able soldier; but his record down to this point did not subsequently count to him for righteousness in Jewish eyes. The Jewish people could not forgive Josephus for having been the only survivor of the garrison of Jotapata to give himself up alive, instead of falling in action or committing suicide; nor could they forgive him for having made favour thereafter with Vespasian and for having attempted, in the final campaign, to persuade the fanatical defenders of Jerusalem to capitulate before it was too late. No doubt Josephus had been in the black books of the Zealots from the outset as an original opponent of the war, who had only taken up arms against his better judgement after he and his party had lost control of the political situation. (For Josephus's part in the war down to the siege of Jotapata, see his *Autobiography*, chs. 4-74. For the siege of Jotapata and the circumstances in which Josephus not only escaped with his life but promptly established himself in the good graces of Vespasian, see *The Romano-Jewish War*, Bk. III, chs. 127-408.)

² See Josephus's own rather self-complacent account of his life after becoming the protégé of Vespasian in his *Autobiography*, chs. 75-6.

³ *The Romano-Jewish War*, Bk. I, ch. 3.

Jewish side. When all my material was in the proper state of preparation, I took advantage of a period of leisure at Rome to employ the services of collaborators to help me with the Greek language, and I thus wrote out my narrative.¹

It will be seen that, in their external aspect, the career of Josephus and the career of Thucydides ran an almost identical course, but that there is a profound difference in the spiritual response which the same challenge evoked from the two personalities. The response of Thucydides is a noble example of the tragic *catharsis*; and, in 'the everlasting possession' into which the Athenian exile has transmuted his transitory experience, the dross of egotism and animus has all been refined away. As we read Thucydides' history, we are conscious that the author's personal misfortune is genuinely of no account in the author's own eyes by comparison with the public catastrophe which has overtaken Athens and Hellas; and even the deep emotion which the consciousness of this catastrophe awakens in Thucydides' soul is so rigorously held in control that we are only made aware of its intensity now and again by the quivering tension which reveals itself, here and there, through the texture of the historian's calm and measured words. In the soul of Josephus, on the other hand, the *catharsis* has been imperfect; and the note which his writing strikes has a tart and polemical tone. While one element in his soul is seeking to transmute the agonizing experience of a war of annihilation into an everlasting memorial of the people and the culture that have been blotted out of the book of life,² there is all the time another Josephus who is seeking a personal relief for a private spiritual malaise. This other Josephus is attempting to heal his personal breach with Jewry by making himself the classic interpreter of Jewry to Hellenism; and he is trying to assuage the stings of his conscience—which will not leave him in peace, in his pampered life of exile in Rome, while Jerusalem lies in ruins—by conducting a perpetual polemic against Hellenism with his pen, as an amends for his having once bought personal immunity and advancement from the lords of the Hellenic World by giving up his sword. In other words, Josephus, in his latter-day literary work, is in some sense pursuing his previous 'practical' activities in a new medium. And this fault is still more conspicuously apparent in the literary work of the French member of our Pleiad: Émile Ollivier.

Ollivier

Ollivier is not without excuse for his frailty, for his personal identification with the disaster that overtook his country in his day

¹ *A Reply to Apion*, Bk. I, chs. 47-50.

² Exod. xxxii. 32; Rev. iii. 5.

was much more intimate, and much more serious, than Thucydides' identification with the fall of Athens or Josephus's with the fall of Jewry. Ollivier was a Frenchman who lived through the Franco-Prussian War of 1870-1. For France, this war, which brought to an end a French political and military hegemony of two centuries' standing on the European Continent, was not only a supreme national catastrophe; it was also a supreme national humiliation, since the war was lost by no honourable defeat but by a lamentable *débâcle*. And for Ollivier this tragic experience of France was a personal tragedy of equal magnitude; for, at the moment when the disaster occurred, Ollivier occupied in France the principal position of political responsibility next to the Emperor Napoleon III himself. While the Emperor was saved from the fury of the French people by falling into the enemy's hands, his minister had to fly the country. Ollivier took refuge in Italy, and when he ventured to return to France in 1873 his life was in ruins. Born in 1825, engaged in politics from 1848 to 1870, and virtually Prime Minister in the Imperial Government during the fatal days between the end of 1869 and the 9th August, 1870, Ollivier now found himself, at the age of forty-eight, a scapegoat in the wilderness, with all the transgressions of the Second Empire heaped upon his devoted head.¹

Ollivier's retort to the outrageous Fortune which had felled his country and himself by the same terrific blow was to write, on the grand scale, a history of the whole unhappy chapter in French history in which he had played his own unhappy part. The prologue to the drama, as he presents it in *L'Empire Libéral*,² begins with the morrow of the peace-settlement of 1815; the curtain descends upon the *débâcle* of 1870 after Ollivier's fall from office on the 9th August of that year and his subsequent abortive private mission to Italy. The first volume was published in 1895, a quarter of a century after the catastrophe, when the author himself was already seventy years old;³ and thereafter volume followed volume

¹ Ollivier applies the simile of the scapegoat to himself in *L'Empire Libéral*, vol. i, p. 30.

² *L'Empire Libéral: Études, Récits, Souvenirs*, par Émile Ollivier (Paris 1895-1912, Garnier Frères, 16 volumes).

³ The final and effective decision to write seems to have been taken by Ollivier as a consequence of Bismarck's outright avowal that he had deliberately precipitated the war by tampering with the text of the famous 'Ems Telegram'. This outright avowal was not made until 1892, after Bismarck's dismissal from the Chancellorship of the German Reich by the Emperor William II. Ollivier appears to have been stirred by this revelation in two ways. He was elated to see the responsibility for the outbreak of the war transferred from the shoulders of France to the shoulders of Germany by so conclusive an authority as Bismarck himself; and he was outraged to find that Bismarck's confession was not being taken by public opinion as an exoneration of Ollivier for his own part in those transactions. *L'Empire Libéral* seems to have been committed to writing under this twofold stimulus. The context in which Ollivier gives his account of Bismarck's avowal is illuminating. (See *L'Empire Libéral*, vol. i, pp. 24-31.)

year by year until the sixteenth and last volume was published in 1912, when the author was eighty-seven and when the greater war of 1914-18, which was to reverse the result of the war of 1870-1, was only two years ahead in the future.¹ In thus transferring to historiography the energies that had been expelled from the field of politics twenty-five years earlier, Ollivier was not achieving a spiritual *catharsis* and was not pursuing the path of 'etherialization'. To parody a notorious maxim of his Prussian enemies,² he was rather taking up the historian's pen in order to pursue the politician's aims by the best alternative means that still remained at his disposal. The driving force that impels him to write and write from his seventy-first to his eighty-eighth year is a burning desire to vindicate France and to vindicate Ollivier.

The first of these two motives is proclaimed at the beginning of the book:

'À la veille de disparaître de ce monde, je veux donner une dernière preuve de dévouement à la patrie bien aimée à laquelle j'ai consacré toutes mes pensées. Je veux la laver devant la postérité de la tache d'avoir déchaîné parmi les hommes la misère, la défiance, la haine, la barbarie. Je veux démontrer qu'en 1870 elle n'a pas été plus agressive qu'elle ne l'avait été en 1792 et en 1806; qu'alors comme autrefois elle a défendu son indépendance, non attenté à celle d'autrui. Laissant aux contempteurs de son droit les gémissements dont depuis tant d'années ils affaiblissent son courage, je lui tends la coupe où l'on boit le cordial qui rend la foi, la force, l'espérance. Si elle l'accepte, tant mieux pour elle!'³

The patriotic motive, here confessed, is plain to read; but the personal motive, which Ollivier is at pains to deny, is equally unmistakable. It is revealed in the author's chagrin that Bismarck's avowal of his responsibility for precipitating the war has not served to vindicate his own—Ollivier's—reputation.⁴ It is revealed in the ostentation with which he abstains from vindicating himself (for 'on s'excuse même en renonçant aux excuses'). Above all, it is revealed in his grand finale, which is not the *débâcle* at Sedan and is not the fall of Metz and is not the fall of Paris and is not the signature of the Peace of Frankfurt, but is—at the end of sixteen volumes—the fall of the Ministère Ollivier!

¹ The writer of this Study, who was an undergraduate at Oxford at the time when the last volumes of *L'Empire Libéral* were appearing, can well remember the interest which their publication aroused.

Machiavelli

If Émile Ollivier is the dimmest member of our Pleiad, Niccolò Machiavelli is as bright a star as Thucydides himself.

Machiavelli (*vivebat* A.D. 1469–1527) was a citizen of Florence who was twenty-five years old when King Charles VIII of France crossed the Alps and overran Italy with a French army in A.D. 1494. He thus belonged to a generation which was just old enough to have known Italy as she had been during her age of immunity from 'barbarian invasions'; and he lived long enough to see the peninsula become the international arena for trials of strength between sundry Transalpine or Transmarine Powers, which found the prize and the symbol of their alternating victories in snatching from one another's grasp an oppressive hegemony over the once independent Italian city-states. This impact upon Italy of non-Italian Powers was the challenge which the generation of Machiavelli had to encounter and the experience through which they had to live; and the challenge was the more difficult for the Italians of this generation to meet inasmuch as the experience had not been tasted, either by these Italians or by their forefathers, for the best part of two and a half centuries.

The immunity which was broken (for nearly four centuries to come) by the French invasion of A.D. 1494 had been enjoyed down to that date, with little or no interruption, since the death of the Holy Roman Emperor Frederick II in A.D. 1250. Between those two dates, the Italian city-states had not only lived their own parochial lives in political freedom and security from external attack behind the 'natural frontiers' of the Alps and the sea, but on the economic plane their merchants and manufacturers had dominated the business-life of three worlds: the Arabic World and the main body of Orthodox Christendom, as well as the whole of Western Christendom. The coasts of the Levant and the Black Sea had been bespangled with Italian trading-ports and naval stations and colonies. The Republic of Venice had made herself mistress of Crete; Florentine dukes had ruled in Athens; the Greek Emperor in Constantinople had been browbeaten by his Genoese neighbours across the Golden Horn at Galata; and the Genoese flag had flown as far afield as Caffa in the Crimea and Tana at the mouth of the Don, in the far corner of the Sea of Azov. Moreover, Italian explorers had pushed their way beyond the farthest limits of Italian empire and commerce. Some twenty-five years after Frederick II's death three Venetian explorers, the Polos, had made their way to China across the whole breadth of the Eurasian Steppe; and, just two years before Charles VIII's passage of the

300 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
Alps, a Genoese explorer, Columbus, had made his way across the whole breadth of the Atlantic to the West Indies.

But the greatest achievements of the Italian genius during those two and a half centuries of immunity had not been extensive but intensive, not material but spiritual. In architecture, in sculpture, in painting, in literature, and in almost every other province in the realm of aesthetic and intellectual culture, the Italians, during those centuries, had been performing works of creation that bear comparison with the creative achievements of the Greeks during an equal period of time in the sixth and fifth and fourth centuries B.C.¹ In fine, the Italians had used their long-sought, hard-won immunity from alien military and political domination in order to create, within their sheltered peninsula, a miniature Italian World apart within the wider world of Western Christendom—an Italian World in which the level of the Western Civilization had been raised precociously to such a high degree that the difference of degree became tantamount to a difference in kind. By the close of the fifteenth century the Italians were, and felt themselves to be, so far superior in civilization to all other Westerners (with the possible exception of the Flemings) that—half in conceit and half in earnest—they revived the term ‘barbarians’ to describe the Western peoples on the farther side of the Alps and beyond the Tyrrhene Sea. And then, in this very generation, the latter-day ‘barbarians’ began to act in character by showing themselves militarily and politically wiser than the Italian children of light.²

As the new Italian culture radiated out of the peninsula in all directions, it had quickened the cultural growth of the peoples round about, and quickened it first in the grosser elements of culture—such elements as political organization and military technique—in which the effect of radiation is always most prompt to make itself felt.³ In consequence, the ‘barbarian’ peoples of Western Christendom, while remaining little less barbarous than before in everything else, had begun to overtake their Italian teachers in the mastery of the military and political arts; and when once they had mastered them they were able to apply them on a vastly larger scale than the scale of the Italian city-states. Their ability to surpass the Italians in this material way was not, of course, a symptom of any greater inborn genius. On the contrary, the ‘barbarians’ were manifestly inferior in political and military

¹ The Italians, of course, sought inspiration from this ancient Greek genius by evoking the ghost of the extinct Hellenic culture, first in its latter-day second-hand Latin version and eventually in its original Greek form. (For this Italian Renaissance of Hellenic Culture, see further IV. C (iii) (c) 2 (x), vol. iv. p. 275, footnotes 1 and 2, as well as Part X, below.) ² Luke xvi. 8.

³ For this phenomenon of social radiation, see Part II. A, vol. i, p. 187, and Part III. C (i) (a), pp. 151-3, above, and Parts VIII and IX, below.

as well as in artistic and literary genius to the Italians of Machiavelli's age. The explanation of the 'barbarians' relative success in achieving a scale of social organization which the Italians had found to be beyond their own powers lies in the fact that the 'barbarians' were applying the political lessons which the Italians had taught them in far easier circumstances than those with which statesmanship had to contend in contemporary Italy.

In Machiavelli's generation, Italian statesmanship was being handicapped, and 'barbarian' statesmanship was being facilitated, by the operation of one of the regular laws of 'the Balance of Power'.¹

The Balance of Power is a system of political dynamics that comes into play whenever a society articulates itself into a number of mutually independent local states; and the Italian Society that had differentiated itself externally from the rest of Western Christendom during the second chapter in the history of our Western Civilization (*circa* A.D. 1075-1475) had at the same time articulated itself internally in this very way. The political movement to extricate Italy from the Holy Roman Empire had been initiated and carried through by a host of 'communes' or city-states which were striving, each for itself, to assert a right to local self-determination; so that the creation of an Italian World apart and the articulation of this world into a multiplicity of local states were coeval events in Italian history. Thus the Balance of Power had been introduced from the outset into the political structure of this new Italian version of the Western Civilization; and indeed the Italian city-states were already contending fiercely with one another in order to maintain or modify or restore this balance among themselves long before they had completed their common task of shaking themselves free from the old Imperial trammels. At this stage of Italian history, however, the loss of energy and the destruction of wealth and life and happiness which were caused by this internal political strife were not yet so serious as to check the new Italian Society's growth in civilization. This growth made headway in all those fields of activity that have been cited above; and, as Italy grew in spiritual stature, she radiated her culture, as has been described, into the regions round about her. The effect of this continuing radiation of culture from an Italian source of social energy was to bring an ever widening circle of surrounding countries and peoples within the ambit of the Italian Civilization in this or that sphere of social activity and in this or that degree. It has been mentioned already that (as always happens) the first

¹ The various laws of interaction between mutually independent states that follow from 'the Balance of Power' are examined in greater detail in Part XI, below.

302 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
sphere of activity in which the 'barbarians' made substantial progress in learning from their Italian teachers was the sphere of military and political technique. And at this point one of the laws of the Balance of Power comes into play.

The Balance of Power operates in a general way to keep the average calibre of states low in terms of every criterion for the measurement of political power: in extent of territory and in head of population and in aggregate of wealth. It operates in this way through a system of pressures; a state which threatens to increase its calibre above the prevailing average becomes subject, almost automatically, to pressure from all the other states that are members of the same political constellation; and it is one of the laws of the Balance of Power that, in any given constellation of states in which the political units are in this dynamic relation with one another, the pressure is greatest at the heart of the constellation and relaxes progressively towards the periphery.

At the centre, every move that any one state makes with a view to its own aggrandizement is jealously watched and adroitly countered by all its neighbours, and the sovereignty over a few square feet of territory and a few hundred 'souls' becomes a subject for the bitterest and stubbornest contention. For this reason, it commonly happens that, at the centre of the constellation, no appreciable political result is produced by the application of even the highest genius or by the mobilization of the utmost energy. The severity of the mechanical pressure under which the statesman has to operate here effectively counteracts the statesman's ablest efforts; while, on the other hand, on the periphery, a second-rate statesman is capable—thanks to the relatively slight degree of pressure under which he has to work—of producing results that arouse the astonishment and envy of the first-rate statesman at the centre. In the easy circumstances of the periphery quite a mediocre political talent is often able to work wonders. In this field, the second-rate statesman can carry out his naïve moves without their being frustrated or even being suspected by his local rivals; and he can annex a province or a kingdom or even a whole continent without arousing as much opposition as his brilliant contemporary in the central region has to face when he seeks to annex a single fortress or a single village. The domain of the United States can be expanded unobtrusively right across North America from Atlantic to Pacific, the domain of Russia right across Asia from Baltic to Pacific, in an age when the best statesmanship of France or Germany cannot avail to obtain unchallenged possession of an Alsace or a Posen.

This extreme unevenness in the distribution of political pressure

prescribes a law of the Balance of Power which can be formulated as follows: If a given society is articulated politically into a multiplicity of mutually independent local states, with the result that the Balance of Power has been introduced into the dynamics of this society's political structure; and if this society proceeds to grow in civilization, with the result that it radiates its culture out abroad and thereby enlarges its own geographical ambit:¹ then the states that occupy the heart and homeland of this civilization will sooner or later be dwarfed and overshadowed and dominated by the rise, around the periphery of the expanding constellation, of a whole new order of Great Powers with an overwhelmingly greater average calibre.

There are many historical examples of this phenomenon; and, to look no farther than our own present predicament,² we can see that the multiplicity and the discord of the national states of Europe is being challenged collectively in our generation by the rise, in Asia and overseas, of a new order of Great Powers of a vastly greater average magnitude. The United States, which has been the first of these giants to grow to full stature, is to-day a match, not merely for this or that European state or group of states, but for all Europe put together (if Europe ever can be put together by the genius of any European statesman). And to-morrow we Europeans must look forward to seeing our little European World encircled by a dozen giants of the American calibre when Canada and Argentina and Australia have peopled their empty spaces, and when Russia and India and China and Brazil have acquired the knack of efficiency, and when the Union of South Africa has expanded its domain from the Tropic of Capricorn to the Equator.

¹ In the case of an expanding civilization, the unevenness in the distribution of the political pressure as between the centre and the periphery is accentuated by a psychological factor which the process of geographical expansion brings into play. Two common forms which expansion takes are the cultural assimilation of outer barbarians and the physical occupation of outlying regions by colonists from the homelands of the expanding society. The effect of both these forms of expansion is to create 'new countries'; and in 'new countries' of both kinds there is a high degree of psychological plasticity which works powerfully in favour of political consolidation. The political value of this psychological factor is illustrated by the relative ease with which the statesmanship of the Roman Republic was able to incorporate the semi-barbarous mountaineers of the Sabina and Picenum into the Roman body politic, by contrast with the strength of the resistance that was offered by a Veii or a Capua. Another illustration is the relative ease with which British statesmanship has succeeded in creating new self-governing nations out of the bi-national White populations of Canada and South Africa, by contrast with that fissiparous tendency in European multi-national states which disrupted the pre-war Austria and which is threatening to disrupt the post-war Belgium. (For the plasticity of colonial populations and the way in which this factor has worked in favour of the construction of the British Commonwealth of Nations, see further Toynbee, A. J.: *The Conduct of British Empire Foreign Relations since the Peace Settlement* (London 1928, Milford), pp. 37-8.)

² Other examples are to be found in the history of the Sinic World *post Confucium*, during 'the period of contending states', and in the history of the Hellenic World *post Alexandrum*. This latter example is dealt with on pp. 310-12, below, apropos of the career of Polybius.

When that day comes, the pygmy countries of Europe, instead of being confronted by a single giant, will be encircled by half a dozen; and these encompassing giants, who already overtop us as they grow in stature, all owe their gigantic strength to the currents of vitality that have been flowing into their frames, through one medium or another, from Europe itself. These gigantic countries of the extra-European World have either been colonized by European immigrants or they have been overrun by European conquerors or they have been opened up by European traders or else they have been spiritually irradiated by European techniques or institutions or ideas without any physical inoculation with European flesh and blood; but, whatever the process may have been, they have all been brought to life by being brought within the ambit of that Western Civilization of which Europe has been the fountain-head. And thus it would appear that—to invert a famous phrase¹—we Europeans have called a new world into being not to *redress* but to *upset* the balance of the old.²

In the light of the political laws which we have analysed above, we can see objectively that this 'dwarfing' of Europe is the natural and indeed the inevitable result of the expansion of our Western Civilization when it has expanded out of a continent that is partitioned politically into a multiplicity of states and when its inter-state relations are governed by the principle of the Balance of Power. At the same time, the result is, subjectively, a strange sensation for us Europeans who, in our generation, are living through this experience. It is strange to find Europe being dwarfed and put out of countenance by the outer world which she has succeeded in bringing within her ambit through the radiation of her higher culture. It is strange to realize that she may emerge from her last four centuries of triumphal progress as the servant, and not as the mistress, of the other continents round about her. An uncomfortable blend of bewilderment and misgiving and pique and irony is the characteristic state of mind of a European in our generation when he gazes out at the 'Brave New World' which he sees arising all around him. And this was likewise the state of mind of an Italian in Machiavelli's generation, when he looked abroad and saw the 'barbarians' looming up from outer darkness into the penumbra of the light that was shining out from Italy into the rest of Western Christendom.

¹ The phrase was uttered by the British statesman Canning in a debate in the House of Commons at Westminster on the 26th December, 1826, in allusion to the part which British statesmanship had played in the liberation of a score of new nations that had come to life in South and Central America within the chrysalis of the Spanish Empire.

² 'The dwarfing of Europe' in our generation is examined further in Part XII, below, *apropos* of the prospects of our Western Civilization.

It was just this Italian light that had given the 'barbarians' their new and formidable vitality. A France politically Italianized by Louis XI and a Spain politically Italianized by Ferdinand and Isabella and an England politically Italianized by Henry VII were the new 'barbarian' Powers which, in Machiavelli's day, were dwarfing an Italian Florence or Venice or Milan and were putting the whole of Italy out of countenance.¹ It is curious to reflect that these raw 'barbarian' Powers which were overshadowing the city-states of Italy at the turn of the fifteenth and sixteenth centuries are the self-same nation-states of Transalpine Europe which, in their turn, are being overshadowed now, four centuries after, by the rising continent-states of an extra-European World. By A.D. 1527, the year of Machiavelli's death, his Florence and Venice and Milan had come to stand to France and Spain and England as our England and France and Spain were standing in A.D. 1927 to Canada and Russia and the United States.

This situation is a challenge to statesmanship. If the pygmy states at the centre take no preventive action, it is obvious that the giant states on the periphery are bound to overwhelm them by sheer weight of metal; and this means that, on the political plane, the creators and sustainers of the common civilization will lose their power of initiative and perhaps their independence, and that the sceptre will pass to the outer 'barbarians' who are not yet fit to wield it. This will not only be a political calamity for the pygmy central states; it will also be a cultural calamity for Society as a whole. From every point of view, it is in the public interest that this calamity should be averted; and the duty of averting it devolves upon the statesmen of the central states whose political existence is threatened. It is for them to act, but how are they to perform their task? The solution manifestly lies in somehow transmuting political pluralism and political strife into political concord and political solidarity; but how is this miracle to be achieved? For, as we have observed, it is precisely here, in the centre of the international constellation, that the forces working for political disunity

¹ There were also two other Great Powers which began to press heavily upon Italy in Machiavelli's lifetime, but which had not been brought to life by the radiation of Italian influence. One of these other two Powers was the Ottoman Empire, which engulfed the Italian enclaves in the Levant as soon as it had finished its conquest of the Orthodox Christians. (The 'Osmanlis made themselves masters of Genoese Galata in A.D. 1453 and of Florentine Athens in 1456; and in 1470 they conquered Venetian Negrepont in the course of a great Venetio-Ottoman War which lasted from 1463 to 1479, and which did not end until the Ottoman cavalry had appeared in Friuli (in 1477-8). In 1475 they annexed Genoese Caffa and Tana, and in 1480 an Ottoman expeditionary force momentarily occupied Otranto.) The other Great Power which arose on Italy's eastern flank was the Danubian Hapsburg Monarchy, which took shape in A.D. 1526—a few months before Machiavelli's death—as a carapace to protect the eastern borders of Western Christendom against Ottoman onslaughts. (For this function of the Danubian Hapsburg Monarchy see II. D (v), vol. ii, pp. 177-90, above.)

and discord exert their strongest pressure. It will be seen that the task which confronted Italian statesmanship in Machiavelli's generation, and which likewise confronts European statesmanship in ours, is a task of peculiar difficulty; if the problem can be solved at all, it can only be solved by some stroke of genius; and, in the Italy of Machiavelli's generation, Niccolò Machiavelli himself had many of the qualities for serving as the man of the hour.

Machiavelli was endowed by Nature with consummate political ability; he had an insatiable zest for exercising his talents; and Fortune conspired with merit to give him his opportunity. Fortune made him a citizen of Florence, one of the leading city-states of the peninsula; and merit won him, at the age of twenty-nine, the post of secretary to the Government of the Republic. Appointed to this important office at Florence in A.D. 1498, four years after the passage of the 'barbarian' Charles VIII, Machiavelli acquired a first-hand knowledge of the new 'barbarian' Powers in the course of his official duties; for the Florentine Government sent their Secretary abroad on frequent diplomatic missions, and these not only to other Italian Governments but also to the Courts of the formidable potentates beyond the Alps. In the course of the fourteen years during which he held his Secretaryship, Machiavelli was sent on one mission to the Emperor and on no less than four missions to the Court of France; and his writings show how ably he turned these occasions to account.¹ With his genius for political observation, he studied and apprehended and recorded exactly those features in the political structure of the new Transalpine nation-states which were of practical interest and importance for contemporary Italian statesmanship. After fourteen years of this experience, Machiavelli had become perhaps better qualified than any other living Italian for taking in hand the urgent task of helping Italy to work out her political salvation, when a turn in the wheel of Florentine domestic politics suddenly expelled him from his whole field of 'practical' activity. On the 7th November, 1512, Machiavelli was deprived of his Secretaryship of State; in the February and March of the following year he suffered imprisonment and torture; and, although he was lucky enough to emerge again alive, the price which he had to pay for his release from prison was a perpetual rustication on his farm in the Florentine countryside at San Casciano, where he found himself wholly cut off from all those affairs of state in which he had hitherto lived

¹ See the instructions, dispatches, and reports, relating to these five diplomatic missions, which are printed in Machiavelli's collected works, as well as his four special studies on France and Germany (*Ritratti delle Cose della Francia, Ritratti delle Cose dell'Alamagna, Rapporto delle Cose della Magna, Discorso sopra le Cose di Alamagna e sopra l'Imperatore*).

and moved and had his being. The break in his career was complete; yet, in putting him to the proof of this tremendous personal challenge, Fortune did not find Machiavelli wanting in the power to make an effective response.

The fallen and imprisoned statesman had already decided on his response before he had obtained his release, as is apparent from the following passage in a letter of the 9th April, 1513, which he wrote to a friend and former colleague from his place of confinement:

'Fortune has decided that, as I do not know how to talk about the *Arte della Seta* or the *Arte della Lana*,¹ or about profits and losses, my cue must be to talk about the State. I have to talk about that or else resign myself to keeping quiet.'²

Already, the *ci-devant* Secretary of State was preparing to return as a political philosopher to a world which had cast him out as a practical politician; and the circumstances in which this change of role was actually achieved are described by the philosopher himself in another letter addressed to the same correspondent and written before the close of the same calendar year:

'Here I am on the farm; and, since those last experiences of mine, the number of days that I have spent in Florence does not amount to twenty, all told. I have spent my time since then in fowling—thrushes—with my own hand, rising before daylight. I have been setting bird-lime and going along with a bundle of cages on my back, for all the world like Geta when he came from the harbour with Amphitryon's books. I have been catching at least two thrushes a day, and sometimes as many as seven. In this way I occupied myself for the whole of September. After that, this sport came to an end (to my regret, in spite of its being odd and not worth caring about); and I will now tell you what my life has been since then.

'I rise with the Sun, and go my ways to my wood, which I am having cut. I stay there two hours inspecting the previous day's work and passing the time with the wood-cutters, who always have some trouble on hand, with their neighbours if not among themselves. About that wood I have a thousand tales to tell of the things that have happened to me. . . .

'After leaving the wood, I go off to a spring, and from there to a fowling-place of mine, with a book stowed away: a Dante or a Petrarch or one of these minor poets: say, Tibullus or Ovid or the like. I read those tales of lovers' passions and call to mind my own and indulge myself a little in such reminiscences. Then I transfer my quarters to

¹ In Florentine parlance, these two terms might mean either 'the Woollen Industry' and 'the Silk Industry' or else 'the Wool Guild' and 'the Silk Guild' which were two of the six 'Greater Corporations' (*Arti Maggiori*) that constituted the ruling oligarchy of the Florentine city-state.—A. J. T.

² From a letter of the 9th April, 1513, to Francesco Vettori (Machiavelli: *Lettere Familiari*, No. xiii).

the roadside inn, talk with the passers-by, ask them the news of their villages, hear all kinds of things and note the various tastes and diverse fantasies of Mankind. Then comes the hour for dinner, when I eat, with my household, of such viands as this poor farm of mine and this tiny property can afford me. So soon as I have eaten, I return to the inn; and, here, most days, I find the inn-keeper, a butcher, a miller, and two kiln-tenders. With this company I amuse myself to day's end playing cards—source of a thousand disputes and a thousand bouts of mutual abuse. Most times the stakes are a farthing; and, for all that, our shouts can be heard from San Casciano. Thus, amid these trifles in which I am enveloped, I drag my brain out of the mildew in which it moulders and purge out the malignity of my fortune—content to let Fate trample on me in this way, if only to see whether she won't become ashamed of herself.

'When the evening comes, I return to the house and go into my study; and at the door I take off my country clothes, all caked with mud and slime, and put on court dress; and, when I am thus decently re-clad, I enter into the ancient mansions of the men of ancient days. And there I am received by my hosts with all lovingkindness, and I feast myself on that food which alone is my true nourishment, and which I was born for. And here I am not abashed to speak with these Ancients and to question them on the reasons for their actions. And they, in their humanity, deign to answer me. And so, for four hours long, I feel no gêne, I forget every worry, I have no fear of poverty, I am not appalled by the thought of death: I sink my identity in that of my Ancient mentors. And since Dante says that there can be no science without some retention of that which Thought has once comprehended, I have made notes of the mental capital that I have acquired from their conversation, and have composed an essay *De Principatibus*, in which I try to penetrate as deep as I can into the theory of the subject—discussing what Sovereignty is, what varieties of it there are, how these are acquired, and how they are maintained, and through what causes they are lost. And if ever any conceit of mine has pleased you, you should not be displeased by this, while a sovereign—and especially one newly installed—should find it acceptable. Accordingly, I am dedicating it to His Magnificence Giuliano [de' Medici]. Filippo Casavecchia has seen it and will be able to regale you with the substance of the thing and with the arguments I have had with him—though all the time I am enriching it and re-polishing it.'¹

This was the origin of *The Prince*; and the concluding chapter of the famous treatise, which is an 'Exhortation to liberate Italy from the Barbarians', reveals the intention that Machiavelli had in mind when he took up his pen to write. He was addressing himself once more to the one vital problem of contemporary Italian statesmanship in the hope that perhaps, even now, he might help to

¹ Machiavelli, Niccolò: Letter of the 10th December, 1513, to Francesco Vettori (*Lettere Familiari*, No. xxvi).

bring that problem to solution by transmuting into creative thought the energies which had been deprived of their practical outlet. If *The Prince* had happened to inspire some living Italian princeling—if a Medici or Este or Sforza or Gonzaga had employed the author's methods to attain the author's ends—it is not inconceivable that Machiavelli might have lived to see the political union of Italy accomplished; and, had this Italian political problem been solved in that age, the consequences would assuredly have been far-reaching. In the *Cinquecento*, a politically united Italy would have easily driven the Transalpine 'barbarians' beyond her borders, and she might even have established over her discomfited invaders as decisive an ascendancy in the cruder commerce of politics and war as the politically disunited Italy of the *Quattrocento* had established already over the rest of Western Christendom on the ethereal planes of Literature and Art.

In fact, of course, the political hope that animates *The Prince* was utterly disappointed. The problem of Italy's political disunity was not solved by Italian statesmanship in Machiavelli's lifetime; and therefore it was Italy's fate to serve for centuries as the battle-field of 'barbarian' armies and the prize of 'barbarian' victories—a prize that fast depreciated in value as it was bandied to and fro between alternate 'barbarian' victors. Spanish and Austrian and French hegemonies came and went and monotonously came again. It was only in the nineteenth century, when more than four hundred years had passed since Machiavelli's birth, that the political union of Italy was belatedly accomplished; and, *au fin du compte*, the Italian people had to pay a heavy price for the long incompetence of Italian statesmanship. While an Italy united in the sixteenth century might have made herself mistress of Europe and have contended with the 'Osmanlis on equal terms for the dominion of the Levant, the Italy who completed her union on the 20th September, 1870, was content to take her place in the rank and file of European states as the last and least of the latter-day Great Powers.

Thus *The Prince* failed to achieve its author's immediate aim, as this aim is presented in the final chapter; but this is not to say that *The Prince* was a failure; for 'the pursuit of practical politics by literary means' was not the essence of the business which Machiavelli was going about when, evening after evening in his remote farm-house, he entered into the mansions of the men of ancient days and ate of the ambrosia which he had been born to eat. In these rare hours of mental retreat, the fallen politician was freer from the burden of practical politics than at any other times in his life; yet, in virtue of this complete withdrawal from the plane of

activity on which he had made his first effect upon the World, Machiavelli was able to return to the World on a more ethereal plane on which his effectiveness has been vastly greater. Even if he had retained his Secretaryship to the end of his days, and even if the political union of Italy had been accomplished in his lifetime through his instrumentality, Machiavelli the practical politician would never have influenced the course of history as it has actually been influenced by Machiavelli the political philosopher. For, in finding his 'true nourishment' in his communion with the Ancients, Machiavelli was really finding his opportunity to perform his life-work. In those magic hours of *catharsis* when he rose above his vexation of spirit, Machiavelli succeeded in transmuting his 'practical' energies into a series of mighty intellectual works—*The Prince* and the *Discourses on Livy* and *The Art of War* and *The History of Florence*—and these fruits of a Florentine politician's broken career have been the seeds of our modern Western political philosophy. The thought which these famous books put out into the World is still living and working in our thought to-day.

Polybius

Polybius of Megalopolis (*vivebat circa 206-128 B.C.*) was born a citizen of a Hellenic city-state in the heart of Continental Greece in an age when Greece was in the same general predicament as Europe in our time or Italy in the age of Machiavelli.¹ In the Hellenic World of the second century B.C., as in our Great Society of the twentieth century of the Christian Era and in the Western Christendom of the *Cinquecento*, the little states in the centre of the World, at the fountain-head of Civilization, were ringed round by a circle of gigantic Powers which the quickening outflow of the living waters had called into life on the periphery. Eastward, the Greek core of the Hellenic World was overshadowed by the Greek 'successor-states' of the Achaemenian Empire: the political progeny of the military conquests of Alexander. Westward it was overshadowed by the even greater Powers of Carthage and Rome: two non-Greek city-states which had been stimulated into empire-building in the process of resisting the impact of Hellenic arms and succumbing to the influence of Hellenic culture. The general situation was one with which we are familiar; but in the Hellenic World of Polybius's day this situation worked itself up to a climax—and out to a catastrophe—which our Western World has hitherto escaped.

¹ The following sketch was written before the writer of this Study had read the sympathetic and penetrating appreciation of Polybius and his work by Mr. T. R. Glover in *The Cambridge Ancient History*, vol. viii (Cambridge 1930, University Press), ch. i.

In the Western World of to-day, the encirclement of Europe by the giant Powers of the penumbra is recent and still incomplete. And the Western World of yesterday, which did see Machiavelli's Italy both encircled and overrun by the Transalpine 'barbarians', was at least spared the spectacle of seeing the giants collide on Italian soil in a war of annihilation. Though Northern Italy had to suffer the damage and humiliation of serving as 'the battle-field of Europe' from A.D. 1494 to A.D. 1866, this evil was mitigated by the fact that, in all the European warfare of this age, 'the European forces' were 'exercised by temperate and undecisive contests'. And the great European historian who wrote these words in 1781 was able to declare his confident belief that 'the Balance of Power will continue to fluctuate, and the prosperity of our own or the neighbouring kingdoms may be alternately exalted or depressed; but these partial events cannot essentially injure our general state of happiness, the system of arts and laws and manners, which so advantageously distinguish, above the rest of Mankind, the Europeans and their colonists'.¹ The confidence here proclaimed was based on the experience of three centuries of European history, and it was to be justified by the subsequent course of events for another century to come.

In all the warfare between French and Spanish armies, and French and Austrian armies, that met in battle on Italian soil in the course of nearly four centuries of European contests from the days of Charles VIII to the days of Napoleon III, no combatant, from first to last, ever dealt his adversary a mortal blow; and the Balance of Power between the great Transalpine states continued to fluctuate without being overthrown until the day when Italian statesmanship at length succeeded in abating the nuisance of this high-handed usage of Italy as an arena for Transalpine military exercises by fulfilling Machiavelli's dream and consolidating Italy herself into a single united nation-state of the Transalpine calibre—a state strong enough to guard its own frontiers and to warn off, for the future, the habitual Transalpine trespassers. This has been the relatively fortunate history of the relations between Europe and Italy during the epoch of Western history that began in Machiavelli's lifetime and came to a close in 'the eighteen-seventies'. Let

¹ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, ch. xxxviii, *ad finem*: 'General Observations on the Fall of the Roman Empire in the West.' The passage here quoted appears to have been written some time during the first quarter of the year 1781, at a moment when the author's own country happened to be engaged in fighting a losing battle. At that moment, the American Revolutionary War was approaching its crisis. His Britannic Majesty was at war with France and Spain and Holland, as well as with the Thirteen American Colonies; the Northern Powers of Europe were maintaining an unfriendly 'armed neutrality'; and the decisive campaign of the war, which was to end at Yorktown so disastrously for British arms, was about to open! And yet Gibbon's confidence was justified in the event by the peace settlement of A.D. 1783.

us hope that the history of the comparable relations between a latter-day Great Society and Europe may be no more unhappy than this during the centuries to come. For the history of the relations between the Hellenic Great Society and Greece in the lifetime of Polybius shows that a general situation of this kind is fraught with potential dangers which may work out to a disastrous outcome.

In the Hellenic World of Polybius's age, the new Great Powers of the periphery duly found their battlefields on Greek soil, but they did not 'exercise' their forces there 'in temperate and undecisive contests'. In their Greek arena, they fought one another to the death; and Greece was devastated and the Hellenic Civilization destroyed before these gladiatorial combats between Rome and Carthage and Rome and Macedon were brought to an end by a series of 'knock-out blows', which wiped the defeated Powers off the face of the Earth and left Rome, the victor, as the sole surviving Power in the whole circuit of the Mediterranean.

In this deadly warfare on Greek battle-fields between 'barbarian' Powers, a helpless and defenceless Greece suffered only less severely than the vanquished titans. The wars between Rome and Carthage were fought out mainly on Greek soil in Sicily and Magna Graecia; and the Hannibalic War entailed the sack of the two chief Greek cities of the West: Syracuse in 212 B.C. and Tarentum in 209. A larger number of smaller Greek cities suffered the same fate in the wars between Rome and Macedon, which were fought out on the soil of Continental Greece. In the first Romano-Macedonian War, the victims were Aegina and Anticyra (sacked in 211-210) and Oreus (sacked in 208); in the Third Macedonian War they were Haliartus and Coronea (sacked in 171)¹ and seventy cities in Epirus (sacked in 168). And the overthrow of Macedon at Pydna by Roman arms did not spell the end of Greek disasters. A desperate revolt of Macedon against her Roman conquerors in 150-148 B.C. excited the Achaean Confederacy in the Peloponnese to make a declaration of war on Rome next year: a suicidal gesture which resulted in the annihilation of Corinth in 146 B.C., a few months after the annihilation of Carthage. The annihilation of Corinth and the dissolution of the Achaean Confederacy in 146 B.C. dealt the final blow to Greek prosperity and Greek independence.

This was the overwhelming experience through which Polybius lived and of which he eventually became the historian.

'The events which he has chosen as his subject are sufficiently extraordinary in themselves to arouse and stimulate the interest of every reader, young or old. What mind, however commonplace or indifferent,

¹ See II. D (v), vol. ii, p. 213, above.

could feel no curiosity to learn the process by which almost the whole World fell under the undisputed ascendancy of Rome within a period of less than fifty-three years,¹ or to acquaint itself with the political organization to which this triumph—a phenomenon unprecedented in the annals of Mankind—was due? What mind, however infatuated with other spectacles and other studies, could find a field of knowledge more profitable than this?

That is how Polybius apostrophizes his readers in the preface to his *Oecumenical History*;² but although this panoramic history of his own times was Polybius's life-work, it was not as a historian that he started his career; for all the circumstances of his birth and upbringing drew him in his youth towards the life of a practical politician.

Polybius's native city, Megalopolis, was an Arcadian community which was one of the leading states-members of the Achaean Confederacy. Its accession to the Confederacy, some thirty years before the date of Polybius's birth, had been an historic event, which had given the Achaean Confederacy a prospect of achieving the political unification of all the Peloponnese, and perhaps of all Continental Greece. The accession of Megalopolis, which had opened this prospect up, had been the work of a high-minded and clear-sighted Megalopolitan statesman, Lydiadas, who had found himself despot of his native city and had voluntarily abdicated from this post of personal power in order to serve the public interest both of Megalopolis and of Greece. In making this generous gesture, Lydiadas of Megalopolis was taking up the policy of his contemporary Aratus of Sicyon—the Greek statesman who had started the movement for turning the ancient parochial Achaean Confederacy into the nucleus of a wider Greek political union by persuading his own city Sicyon to enter the Confederacy, as its first non-Achaean state-member, after he had liberated Sicyon from Macedonian occupation.

It will be seen that Aratus and Lydiadas dreamed the same dream for Greece that Machiavelli dreamed for Italy.³ They

¹ 220–168 B.C.

² Polybius: *Historiae*, Bk. I, chs. 1–4.

³ In the history of the Sinic World, in which the process of geographical expansion produced its usual result of encircling the little states at the centre with an outer ring of younger states of larger calibre (see p. 303, footnote 2, above), the central states sought to protect themselves in the same way as in ancient Greece and in modern Italy: that is to say, by forming a confederacy; and this confederacy 'remained one of the fundamental elements in Sinic politics' for two-and-a-half centuries (Maspéro, H.: *La Chine Antique* (Paris 1927, Boccard), p. 299). Ultimately, however, the Sinic Central Confederacy failed, and this for the same reason as the Achaean League. Though its history bore out the rule that 'union is strength', it never succeeded in making itself quite strong enough to shake itself free from the toils of the surrounding Powers; and thus the Confederacy sank in the end into the position from which its constituent members had hoped to extricate themselves once for all when they joined forces. It became a pawn on the Great Powers' chess-board.

realized that the age-long disunion and strife of the Greek city-states could not continue with impunity in an age when Greece was encompassed about by gigantic Powers of a vastly superior calibre. 'They should be profoundly thankful if they succeeded, by maintaining absolute unanimity and by linking hands like people crossing rivers, in flinging back the onslaughts of the barbarians¹ for the common salvation of their countries and themselves.'² This policy was originally propagated in the Peloponnese by Aratus and Lydiadas; and while it was Aratus of Sicyon who had initiated the idea, it was in Megalopolis, the city of Lydiadas, that the word became flesh in an hereditary school of statesmen. The work of Lydiadas was carried on in the next generation by two other distinguished Megalopolitans, Philopoemen and Lycortas; and Lycortas was the father of Polybius.

Thus Polybius was brought up in a social milieu in which there was a long tradition of public service; and he went into politics as a matter of course. Indeed, his first political appointment was given him by special favour before he had attained the legal minimum age. In 181 B.C. he was appointed member of a diplomatic mission which was to represent the Achaean Confederacy at the Court of Alexandria. Polybius's fellow envoys were his own father Lycortas and Aratus, the son of Aratus the Great; and it was in virtue of his family connexions that the statutory age-qualification was waived on this occasion in the young man's favour.³ After this favourable start in politics, Polybius doubtless looked forward to living the life of 'a practical politician' for the rest of his days; but political events which were beyond the Achaean Government's control were to give quite a different turn to Polybius's career. The young Megalopolitan had happened to come of age during a momentary lull in the great political tornado that was sweeping across his world. Continental Greece had enjoyed a respite from serving as the battle-field of the Powers since 189 B.C., when the Aetolian Confederacy had laid down its arms after a vain attempt to wage war against Rome in alliance with the Seleucid Monarchy. But the respite was brief; for the Third Romano-Macedonian War broke out in 171 B.C.;

¹ The word 'barbarians' is used here as a half-jesting half-serious nickname for the non-Greek Great Powers on the periphery of the Hellenic World and in the penumbra of the Hellenic Civilization. Compare the similar usage, cited above, in fifteenth-century and sixteenth-century Italy.

² This statement of the problem to be solved by Greek statesmanship might well have been made by either Aratus of Sicyon or Lydiadas of Megalopolis, though it was actually made by Agelaus of Naupactus: a statesman of the rival Aetolian Confederacy which was attempting in the same age to achieve the same aim of unifying Greece politically, though round a different nucleus. Agelaus's speech on this theme, which was delivered at a peace conference which was held at Naupactus in 217 B.C., is reported by Polybius in Bk. V, chs. 103-5.

³ See Polybius's own notice of this transaction in Bk. XXIV, ch. 6. The mission never actually sailed for Egypt, after all!

and one of the sequels to the overthrow of Macedon by Rome in 168 was the precautionary deportation to Italy, *en masse*, of leading politicians from the states of Greece. The deportees included a thousand Achaeans; Polybius was one of the number; and this sudden break in his political career was the turning-point in his life.

From that point onwards, Polybius's life was an alternation between periods of compulsory withdrawal from practical politics and other periods of painful return to public affairs. His internment in Italy lasted for more than sixteen years (166-150 B.C.); and during this first compulsory withdrawal he accepted the challenge of Fortune by taking advantage of the break in his political career at home in order to enlarge, in his Italian exile, both the range of his political horizon and the circle of his personal acquaintance.¹ At Rome he learnt to know the Roman Commonwealth from within;² at Rome, likewise, he became the friend and mentor of the most promising young Roman of the next generation: Publius Cornelius Scipio Aemilianus;³ and these two experiences governed the course of Polybius's life thereafter.

Released from internment in 150 B.C., Polybius was drawn back into public affairs by the catastrophic international events of the next five years. In 147 Scipio was elected consul in order to take command in Africa and break the desperate resistance which the Carthaginians were offering to the now overwhelmingly superior force of Rome in the Third Romano-Carthaginian War;⁴ and Poly-

¹ The challenge presented to Polybius and his fellow deportees was severe; for the uncertainty in which they were kept by the deliberate policy of the Roman Senate must have imposed a heavy nervous strain upon their spirits. The nominal reason for which they had been brought to Rome was in order to give them an opportunity of vindicating themselves in person from the charge of having adopted a hostile attitude towards the Roman cause during the Third Romano-Macedonian War. Upon their arrival in Rome, the Senate professed astonishment that it should be asked to pass judgement on citizens of foreign states on whom judgement had already been passed at home. Thereupon, the Achaean Government sent an embassy to Rome to point out that the Achaean deportees had not, as a matter of fact, had any sentence passed upon them in Achaëa, and to ask the Senate either to try the deportees itself or to send them home for trial forthwith. Thereupon the Senate—being determined to prevent the deportees from returning to political life in their own countries, and at the same time desiring to avoid the juridical irregularity of passing judgement itself on individuals who in theory were not under Roman jurisdiction—replied, in writing, to the Achaean embassy that: 'In the opinion of the Senate, it is not in the interests either of the Roman Government or of your Governments that these individuals should return home.' Polybius, who narrates this diplomatic transaction himself (in Bk. XXX, on. 32), has recorded that 'when this reply came out, it not only threw the deportees themselves into a state of utter despair and mental paralysis, but it excited public grief throughout Greece, where the reply was taken as depriving the unfortunates of all hope of salvation. When the terms of the reply became generally known, the feelings of the Greek public were devastated, and people were overcome by a wave of hopelessness.'

² Compare the knowledge of France and Germany which Machiavelli acquired on his more transient Transalpine missions.

³ The origin and history of this friendship between Polybius and Scipio Aemilianus is recorded by Polybius himself in Bk. XXXI, chs. 22-30. It was through Scipio's intercession that Polybius was permitted by the Roman authorities, as a special favour, to continue to reside in the capital when his fellow deportees were distributed for internment among the country towns of Italy.

⁴ Scipio, on this occasion, like Polybius some thirty-four years earlier, had the honour

bios accompanied his Roman friend to the African front. Polybius was thus an eyewitness of the last act of the long tragedy that ended now in the literal annihilation of a commonwealth which had been one of the greatest of the Great Powers in the World at the time of Polybius's birth.¹ And then, from Scipio's camp by the smouldering ruins of Carthage, Polybius was called post-haste to Greece by the news of the outbreak of war between Rome and the Achaean Confederacy; and he arrived in his own country to find Corinth already overtaken by the same awful fate which Carthage had just suffered under his eyes.

Thereupon, Polybius was required, after a twenty years' absence, to resume his political career at home in circumstances which were at once more honourable and more painful for him than any which he could have foreseen or imagined. The Board of Ten Commissioners which the Roman Government, according to its usual practice, had sent out after the termination of hostilities to wind up the affairs of the conquered enemy country now courteously invited Polybius to serve as their expert adviser; and after they had performed their own major task—which was to dissolve the Achaean Confederacy and to confiscate the property of communities and individuals convicted of war-guilt—they left it to Polybius to regulate the affairs of the ex-member-states on the new footing on which they were thenceforth to live.² In this transaction, Polybius deserved as well of his country as in anything that he had ever been able to do for her; and his countrymen were not ungrateful for his services; but it was a transaction which was final by its very nature; and after Polybius had followed the Commissioners to Rome to make his report, he found himself again—and now irrevocably—cut off from practical politics. His second retirement, which now followed, was to last until the end of his long life (he lived to be eighty-two), with one interval when his faithful friendship for Scipio conspired with his insatiable desire for knowledge to draw him out of his retreat and lure him into the heart of Spain

of receiving his appointment in advance of the legal minimum age. Scipio had, in fact, been the only Roman officer to distinguish himself in the first two campaigns of the Third Romano-Carthaginian War—a war which had been forced upon Carthage by the Roman Government with the deliberate intention of destroying Carthage root and branch.

¹ In a passage which has only been preserved at second-hand (in Appian's *Punica*, 132), Polybius himself has recorded how, at the final scene of destruction, Scipio broke down; and how he afterwards quoted two foreboding lines of Homer (*Iliad* vi, ll. 448-9); and how, when Polybius asked him point-blank what he meant by his quotation, Scipio confessed that he was thinking that Rome would suffer one day what Carthage was suffering then.

² Though the Achaean Confederacy was dissolved, the individual states-members (with the exception of Corinth, which forfeited its juridical existence, besides being physically destroyed) retained their juridical sovereignty and *de facto* autonomy as isolated *civitates liberae* under the supervision of the Roman Governor of Macedonia (which, unlike Achaia, was now annexed by Rome and converted into a Roman province).

in order to witness the last phase of the war between Rome and Numantia.¹

In this strange alternation between periods of enforced leisure and other periods of strenuous participation in public affairs, Polybius continued, through his personal merit, to gain experience and achieve distinction while all the World around him, including Rome herself,² was going to wrack and ruin; and as he 'watched the workings of Fortune' and learnt to 'know her genius for envious dealing with Mankind',³ he answered her challenge by transmuting his unemployed ability and frustrated zeal for practical politics into the literary activity of 'depicting the operation of the laws of Fortune upon the grand scale' in an oecumenical history of his own times.⁴ In this work, Polybius the historian has performed an act of creation which could never have been emulated by Polybius the politician; and though the *Oecumenical History* may not be a pearl of as great a price as the work of Polybius's predecessor Thucydides, it is nevertheless, in its own way, 'an everlasting possession' likewise; for Polybius, like Thucydides, had the genius to divine the character of his time and to catch its reflexion in a work of art;⁵ and, like Thucydides again, he also had the strength of mind to bring his genius into play by seizing the unique opportunity that was offered to the historian by the politician's adversity. Expelled from the political life of their respective countries at an age when they were at the height of their personal powers, both men returned after an absence of twenty years to find their countries politically prostrate. But this physical return in the flesh to a home in ruins was not the true return of Polybius and Thucydides; 'for here' they had 'no

¹ Scipio had been appointed to the Spanish command in 134 B.C., as he had been appointed to the African command in 147 B.C., in order to break the resistance of an enemy who was outmatched by Rome in every element of military strength except the vital elements of generalship and *moral*.

² In Bk. XXXI, ch. 25, Polybius describes the general demoralization of the rising generation of the Roman governing class after the destruction in 168 B.C. of Macedon—the last surviving Great Power that had been capable of disputing Rome's ascendancy; and he lived to see the outbreak, in 133 B.C., of the Hundred Years' Revolution which was the nemesis of the devastation of Southern Italy in the Hannibalic War and which was to end in autocracy.

³ Polybius, Bk. XXXIX, ch. 8.

⁴ The work consists of forty volumes (only the first six survive intact), of which thirty contain the main body of the work, two the prologue, and eight the epilogue. The main body (Bks. III–XXXII) records the history of the conquest of the whole Hellenic World by Rome between 220 B.C. and 168 B.C. The epilogue (Bks. XXXIII–XL) carries the story down to the annihilation of Carthage and Corinth in 146 B.C. The prologue (Bks. I–II) carries the story back to the outbreak of the First Romano-Carthaginian War in 264 B.C.

⁵ 'The coincidence by which all the transactions of the World have been oriented in a single direction and guided towards a single goal is the extraordinary characteristic of the present age, to which the special feature of the present work is a corollary. The unity of events imposes upon the historian a similar unity of composition in depicting for his readers the operation of the laws of Fortune upon the grand scale; and this has been my own principal inducement and stimulus in the work which I have undertaken' (Polybius: *Oecumenical History*, Preface = Bk. I, chs. 1–4).

318 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
continuing city'.¹ Megalopolis and Athens were in truth the cities
from which they withdrew; but the city to which they have both
returned, to abide in it for ever, is not the City of Cecrops but the
City of Zeus.²

Clarendon

The English statesman and historian Edward Hyde, Earl of Clarendon (*vivebat* A.D. 1609-1674), saw his life rudely shattered and still more strangely remade by a social convulsion which was scarcely less violent in its way than the terrible experience that fell to the lot of Polybius. In Clarendon's generation, the modern Western World was shaken to its spiritual depths; and out of those depths there emerged a titanic new force—the political force which, under the name of Democracy, is still in the ascendant in our world in our generation, three centuries later.³ This tremendous political movement which is still in motion to-day—expanding in a wave which has latterly submerged the greater part of the Habitable Earth—welled up three centuries ago in a huge eruption of molten lava from the mouth of a single crater. England was the place in Western Christendom where this crater opened in order to discharge to the ends of the Earth a stream of energy that rose, with terrific impetus, from the vast subterranean reservoirs of Western social experience; and Clarendon's generation was the time in which the volcano erupted. Born in 1609, Edward Hyde had reached the age of thirty-three in the year in which the English Civil War between Crown and Parliament broke out, and the outbreak of that war broke up Hyde's life into periods of alternate storm and calm on the pattern which we have detected in the life of Polybius.⁴ The Englishman's lifework, like the Greek's, was the outcome of his inward response to these external vicissitudes; and this truth became manifest to Clarendon himself when, in the haven of his final exile, he reviewed his life-history and saw it in retrospect as a whole. The noble passage in which Clarendon describes his own experience of Withdrawal-and-Return must be given in his own words, which cannot be paraphrased, though they must perforce be abbreviated.

'He was wont to say that, of the infinite blessings which God had vouchsafed to confer upon him almost from his cradle, amongst which he delighted in the reckoning up many signal instances, he esteemed himself so happy in none as in his three acquiescences, which he called

¹ Heb. xiii. 14.

² Marcus Aurelius: *Meditations*, iv. 23.

³ See the present Study, Part I, *ad init.*, vol. i, above, and the present chapter, pp. 359-63, below.

⁴ If the parallel between the lives of Clarendon and Polybius is to be worked out in detail, we shall have to confess that Polybius was more fortunate in his friendship with Scipio than Clarendon in his service to Charles II.

his three vacations and retreats he had in his life enjoyed from business of trouble and vexation; and in every of which God had given him grace and opportunity to make full reflections upon his actions, and his observations upon what he had done himself, and what he had seen others do and suffer; to repair the breaches in his own mind and to fortify himself with new resolutions against future encounters, in an entire resignation of all his thoughts and purposes into the disposal of God Almighty, and in a firm confidence of his protection and deliverance in all the difficulties he should be obliged to contend with; towards the obtaining whereof, he renewed those vows and promises of integrity and hearty endeavour to perform his duty, which are the only means to procure the continuance of that protection and deliverance.

The first of these recesses or acquiescences was his remaining and residing in Jersey, when the Prince of Wales, his now Majesty, first went into France upon the command of the Queen his Mother . . . ; and his stay there, during that time that his Highness first remained at Paris and St. Germain's, until his expedition afterwards to the fleet and in the Downs.¹ His second was when he was sent by his Majesty as his ambassador, together with the Lord Cottington, into Spain; in which two full years were spent before he waited upon the King again.² And the third was his last recess, by the disgrace he underwent and by the act of banishment.³ In which three acquiescences he had learnt more, knew himself and other men much better, and served God and his country with more devotion, and he hoped more effectually, than in all the other more active part of his life.

He used to say that he spent too much of his younger years in company and conversation, and too little with books. . . . He accused himself of entering too soon out of a life of ease and pleasure and too much idleness into a life of too much business, that required more labour and experience and knowledge than he was supplied for; for he put on his gown as soon as he was called to the Bar;⁴ and, by the countenance of persons in place and authority, as soon engaged himself in the business of the profession as he put on his gown, and to that degree in practice that gave him little time for study, that he had too much neglected before; besides that he still indulged to his beloved conversation. Few years passed before the troubles in Scotland appeared, and the Little Parliament was convened; which being dissolved and presently a new one called, he was a member in both, and wholly gave himself up to the public affairs agitated there. . . . And in the beginning of the rebellion he was sworn of the Privy Council and made Chancellor of the Exchequer: and from this time the pains he took, and the great fatigue he underwent, were notorious to all men; insomuch as, the refreshment of dinner

¹ Clarendon's residence in Jersey lasted from the 17th April, 1646, to the 26th June, 1648.—A. J. T.

² Clarendon was actually in Madrid from the 26th November, 1649, until the December of 1650.—A. J. T.

³ Clarendon was required to deliver up the Great Seal on the 30th August, 1667; he had to leave England as a fugitive on the 29th November; and he reached France on the 2nd and December of the same year. He died abroad on the 9th December, 1674.—A. J. T.

⁴ Clarendon was called to the Bar in 1633 at the age of 24.—A. J. T.

excepted, for he never supped, he had very little of the day, and not much of the night, vacant from the most important business. . . .

[His] 'first retreat gave him opportunity and leisure to call himself to a strict account for whatsoever he had done, upon revolving of all his particular actions and the behaviour of other men; and to compose those affections and allay those passions which, in the warmth of perpetual actions and chafed by continual contradictions, had need of rest and cool and deliberate cogitations. He had now time to mend his understanding, and to correct the defects and infirmities of his nature, by the observation of and reflection upon the grounds and successes of those counsels he had been privy to, upon the several tempers and distempers of men employed both in the martial and civil affairs of the greatest importance, and upon the experience he had and the observation he had made in the three or four last years, where the part he had acted himself differed so much from all the former transactions and commerce of his life. . . .

'These unavoidable reflections first made him discern how weak and foolish all his former imaginations had been, and how blind a surveyor he had been of the inclinations and affections of the heart of Man; and it made him likewise conclude from thence how uncomfortable and vain the dependence must be upon any thing in this World, where whatsoever is good and desirable suddenly perisheth, and nothing is lasting but the folly and wickedness of the inhabitants thereof. In this first vacation, he had leisure to read many learned and pious books; and here he began to compose his Meditations upon the Psalms, by applying those devotions to the present afflictions and calamities of his King and country. He began now by the especial encouragement of the King,¹ who was then a prisoner in the Army, to write The History of the late Rebellion and Civil Wars, and finished the first four books thereof; and made an entry upon some exercises of devotion which he lived to enlarge afterwards.

'When he had enjoyed, in that pleasant island of Jersey, full two years, in as great serenity of mind as the separation from country, wife and children can be imagined to admit, he received . . . an express order from the King . . . that he should forthwith attend the person of the Prince of Wales . . . and then without any delay he used all possible diligence to find the Prince. . . .

[In] 'his second retreat and recess' [when he was sent as ambassador into Spain], though he underwent in this employment many mortifications of several kinds, yet he still acknowledged that he learned much during the time of his being in Spain, from whence he returned a little before the Battle of Worcester; and after the King's² miraculous escape into France he quickly waited upon his Majesty, and was never separated from his person till sixteen or seventeen years after by his banishment.

'This he called his third and most blessed recess, in which God vouchsafed to exercise many of his mercies towards him. And though

¹ i.e. Charles the First, not Charles the Second!—A. J. T.

² i.e. Charles the Second.—A. J. T.

he entered into it with many very disconsolate circumstances; yet in a short time, upon the recovery of a better state of health, and being remitted into a posture of ease and quietness, and secure from the power of his enemies, he recovered likewise a marvellous tranquillity and serenity of mind, by making a strict review and recollection into all the actions, all the faults and follies, committed by himself and others in his last continued fatigue of seventeen or eighteen years. . . .

'In all this retirement he was very seldom vacant, and then only when he was under some sharp visitation of the gout, from reading excellent books or writing some animadversions and exertations of his own, as appears by the papers and notes which he left. He learned the Italian and French languages, in which he read many of the choicest books. Now he finished the work which his heart was most set upon, *The History of the late Civil Wars and Transactions to the Time of the King's Return in the Year 1660*; of which he gave the King advertisement. He finished his *Reflections and Devotions upon the Psalms of David*, which he dedicated to his children; which was ended at Montpellier before the death of the Duchess. He wrote and finished his *Answer to Mr. Hobbes's Leviathan*, to which he prefixed an epistle dedicatory to the King, if his Majesty would permit it. He wrote a good volume of *Essays, Divine, Moral and Political*, to which he was always adding. He prepared a *Discourse Historical of the Pretence and Practice of the successive Popes from the Beginning of that Jurisdiction they assume*; in which he thought he had fully vindicated the power and authority of kings from that odious usurpation. He entered upon the forming a *Method for the better disposing the History of England*, that it may be more profitably and exactly communicated than it hath yet been. He left so many papers of several kinds, and cut out so many pieces of work, that a man may conclude that he never intended to be idle."

Ibn Khaldūn

The last member of our Pleiad of historians is 'Abd-ar-Rahmān ibn Muhammad ibn Khaldūn al-Hadramī of Tunis (*vivebat* A.D. 1332-1406)—an Arabic genius who achieved in a single 'acquiescence' of less than four years' length, out of a fifty-four years' span of adult working life, a life-work in the shape of a piece of literature which can bear comparison with the work of a Thucydides or the work of a Machiavelli for both breadth and profundity of vision as well as for sheer intellectual power. Ibn Khaldūn's star shines the more brightly by contrast with the foil of darkness against which it flashes out; for while Thucydides and Machiavelli and Clarendon are all brilliant representatives of brilliant times and places, Ibn Khaldūn is the sole point of light in his quarter of the firmament. He is indeed the one outstanding personality in the

¹ *The Life of Edward Earl of Clarendon, written by himself, ad fin.* (Oxford 1817, Clarendon Press), vol. ii, pp. 549-67.

history of a civilization whose social life on the whole was 'solitary, poor, nasty, brutish, and short'.¹ In his chosen field of intellectual activity he appears to have been inspired by no predecessors² and to have found no kindred souls among his contemporaries and to have kindled no answering spark of inspiration in any successors; and yet, in the Prolegomena (*Muqaddamāt*) to his *Universal History* he has conceived and formulated a philosophy of history which is undoubtedly the greatest work of its kind that has ever yet been created by any mind in any time or place. It was his single brief 'acquiescence' from a life of practical activity that gave Ibn Khaldūn his opportunity to cast his creative thought into literary shape.

Ibn Khaldūn was born into the Arabic World in an age when the infant Arabic Civilization was struggling (as it proved, in vain) to bring order out of the chaos which was its legacy from a recent social interregnum. This interregnum (*circa* A.D. 975-1275) had been the sequel to the break-up of the Umayyad and 'Abbasid Caliphates, which had been the final embodiments of the Syriac universal state; and at the western extremity of the derelict Syriac World—in North-West Africa and in the Iberian Peninsula—the last vestiges of the old order had been swept away by a conflux of barbarians from three continents: European Asturians and Franks from the Pyrenees; African Nomads from the Sahara³ and highlanders from the Atlas⁴ who made themselves a name as the 'Berbers' *par excellence*;⁵ and Asiatic Arab Badu from the North Arabian Steppe who were perhaps the most barbarous and destructive of them all.

The destruction which these barbarians had worked was brought home to Ibn Khaldūn by his family history as well as by his personal experience. The Khaldūns were a prominent house of the aristocracy of Seville⁶ who had emigrated from Andalusia to Africa, about a century before 'Abd-ar-Rahmān ibn Khaldūn's birth, in anticipation of the conquest of Seville by the Castilians;⁷ and in the

¹ The famous description of the life of Primitive Man in the State of Nature which is given by Thomas Hobbes in *Leviathan*, part i, ch. 13. For the history of the Arabic Civilization into which Ibn Khaldūn happened to be born, see I. C (i) (b), vol. i, pp. 70-2, with Annex I, above.

² The education which he received from his masters—of whom he gives an account in his *Autobiography*—seems to have been exceedingly thorough but entirely scholastic. (See the relevant passage, in French translation, in Ibn Khaldūn: *Muqaddamāt*, translated by de Slane, McG. (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. i, Introduction, pp. xix-xxvi.)

³ The Murābits.

⁴ See II. D (v), vol. ii, p. 204, above.

⁵ By origin, the family were Yamanis from the Hadramawt who had migrated to Andalusia, after the Umayyad conquest, in one of the military colonies which were then drafted out to the Iberian Peninsula from the five garrisons of Arab troops in Syria (de Slane, *op. cit.*, vol. i, pp. ix-x).

⁷ Ibn Khaldūn, in his *Autobiography* (translation in de Slane, *op. cit.*, vol. i, p. xv), mentions that his ancestors migrated from Seville to Ceuta some twenty years before the fall of Cordova (A.D. 1236), Carmona (A.D. 1243), Seville (A.D. 1244), and Jaen (A.D. 1246).

⁴ The Muwāhids.

family's new home in Ifriqiyah 'Abd-ar-Rahmān, comparing the local conditions in his own generation, as he saw them, with the descriptions of Ifriqiyah in earlier ages which he read in historical works, was evidently impressed by the greatness of the contrast between present and past and was convinced that the immense change for the worse which had taken place within the last three centuries was the handiwork of the Arab Badawī tribes—the Banu Hilāl and the Banu Sulaym—who had been unleashed in A.D. 1051 upon a rebellious Maghrib by the Fātimid rulers of Syria and Egypt.

'Ifriqiyah and the Maghrib',¹ he writes, 'are suffering still from their devastation by the Arabs. The Banu Hilāl and the Sulaym broke their way in during the fifth century of the Hijrah [the 11th century of the Christian Era]; and they have continued to wreak their fury on these countries for three centuries and a half. Hence devastation and solitude still reign there. Before this invasion, the whole region extending from the [Western] Sudan to the Mediterranean was thickly populated: the traces of an ancient civilization, the débris of monuments and buildings, the ruins of towns and villages, are there to testify to the fact.'²

Ibn Khaldūn was conscious of the difference between this purely destructive Arab invasion during the post-Syriac interregnum and the movement which, some three or four centuries earlier, had brought his own ancestors westward from the Hadramawt to Andalusia. For these Arab emissaries of the Umayyads had come to the Maghrib not to destroy but to fulfil. They had come to step into the shoes of the previous Roman garrisons and Roman officials and to retrieve for the ancient Syriac Society, in its latter days, the former colonial domain of which it had been deprived during eight or nine centuries of alien rule.³

'After the preaching of Islam,' Ibn Khaldūn observes, 'the Arab armies penetrated into the Maghrib and captured all the cities of the country; but they did not establish themselves there as tent-dwellers or as Nomads, since their need to make sure of their dominion in the

¹ In the language of Arabic political geography, the Maghrib (i.e., 'the West') means in a general way the whole of the Arabic World west of Egypt, though the term is apt to be confined to the Arabic domain in North-West Africa to the exclusion of the Arabic domain in the Iberian Peninsula (Andalus). Maghrib al-Aqṣā (i.e., 'the Far West') means Morocco. Ifriqiyah (an Arabization of the Latin name 'Africa') means a region of rather wider extent than the modern Tunisia in which urban and agricultural life had the ascendancy over Nomadism. The successive capitals of Ifriqiyah have been Carthage, Qayrawān, Mahdiyyah, and Tunis.

² Ibn Khaldūn: *Muqaddamāt*, translation by de Slane, vol. i, p. 312. Cp. pp. 66-7.

³ The Syriac culture had been planted on the coasts of North-West Africa and Spain by Phoenician colonists from about the ninth century B.C. onwards. The interval of alien rule between the end of the Carthaginian régime and the beginning of the Umayyad régime had lasted in Spain from the close of the third century B.C. to the beginning of the eighth century of the Christian Era, and in Africa from the middle of the second century B.C. to the middle of the seventh century of the Christian Era.

Maghrib compelled them to keep to the towns. So in the Maghrib at this stage the Arabs did not occupy the open country. It was not until the fifth century of the Hijrah that they came to take up their abode there and to spread tribe-wise in order to camp all over this immense region.¹

The first of the two passages here quoted from the *Universal History* of Ibn Khaldūn occurs in a chapter² which is perhaps the most crushing indictment of Nomad rule over sedentary populations that has ever been delivered from the mouth of a first-hand witness.³ But the thought which had been set in motion in Ibn Khaldūn's mind by his apprehension of the ruin which the Nomads had brought upon the Maghrib did not come to a standstill here. It moved on, with a gathering momentum, to contemplate the contrast between the Nomadic and the sedentary way of life and to analyse the nature of each; to ponder over the group-feeling or sense of social solidarity or *esprit de corps* ('*asabiyyah*') which is the Nomad's psychological response to the challenge of life in the desert; to trace out a connexion of cause and effect between *esprit de corps* and empire-building and between empire-building and religious propaganda; and thence to broaden out until at last it embraced, in a panoramic vision, the rises and falls of empires and the geneses and growths and breakdowns and disintegrations of civilizations.⁴

This mighty tree of thought, with its towering stem and symmetrically branching boughs and delicate tracery of twigs was the eventual outcome of the seedling that germinated in the young 'Abd-ar-Rahmān's mind under the early impression of the contrast between present and past in his native Ifriqiyyah. But Ibn Khaldūn did not begin his career by sitting down to put these burgeoning thoughts into order. It seemed a more pressing task to be putting some rudiments of order into the struggling, chaotic social life of

¹ Ibn Khaldūn: *A History of the Berbers = A Universal History*, vols. vi and vii, French translation by de Slane (Algiers 1852-6, 4 vols.), vol. i, p. 28. The passage here quoted is taken for the text of his tenth chapter by Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot). See further Marçais, G.: *Les Arabes en Berberie du XI^e au XIV^e Siècle* (Paris 1913, Leroux).

² Ibn Khaldūn: *Muqaddamāt*, Bk. I, section ii, *ad fin.* The chapter-headings speak for themselves: 'Every country that is conquered by Arabs rapidly goes to ruin'; 'In general, Arabs are incapable of founding an empire unless they have received a tincture of religion of a certain strength from some prophet or saint'; 'Of all peoples, Arabs are the least capable of governing an empire.'

³ The indictment is the more remarkable when we consider that the particular Nomads at whose expense Ibn Khaldūn makes his *argumentum ad hominem* shared the name of Arab with the author himself; but perhaps it is actually this ostensible kinship which inspires Ibn Khaldūn with his animus against the Banu Hilāl; for the House of Khaldūn had not only been bourgeois for centuries; there was no Nomadic chapter at all in their past; for the peasantry of the Hadramawt is just as sedentary as the bourgeoisie of Mecca or Medina or San'ā. The very accent and argot of the Banu Hilāl set Ibn Khaldūn's teeth on edge. (For this, see the passages quoted by Gautier in *op. cit.*, p. 387.)

⁴ See, further, Annex III, below.

contemporary Ifriqiyah; and this was the task to which the young man found himself called both by family tradition and by personal need of a livelihood. The Macrocosm called him; the Microcosm could wait. And so, at the age of twenty, 'Abd-ar-Rahmān ibn Khaldūn followed in his forbears' footsteps by plunging into local politics as a courtier and a minister of state.

The Arabic adventurer's own account, in his *Autobiography*, of his life during the next twenty-two years reminds a modern Western student of history, who re-reads the story in A.D. 1935, of nothing so much as the life of some latter-day Western-style Chinese politician during the equal span of time which has elapsed since the outbreak of the Chinese Revolution. It was, indeed, a life of 'meeting at night and parting at morning'; for, within this span of twenty-two years, Ibn Khaldūn saw service with no less than seven different princelings; and from almost every one of these successive royal masters his parting was abrupt and violent. In his native principality of Tunis, where he made his début, he remained no longer than a few weeks; and thereafter we find him making a series of brief appearances now in Fez and now in Granada (whence his momentary employer sends him, in A.D. 1363, on an embassy to the court of Peter the Cruel in Seville)¹ and now again in this or that city of Ifriqiyah. In all these peregrinations, his only tranquil 'getaway' was the last; and this, too, was effected *more sinico*.

In the spring of A.D. 1375 Ibn Khaldūn had just settled down at Tilimsān (Tlemçen), under the patronage of the local prince, to give public instruction as a change from practical politics, when it pleased the prince to send his accomplished guest on a political mission to a Nomad Arab tribe in the interior.

'As I had renounced public affairs,' Ibn Khaldūn proceeds, 'in order to live in retreat, the prospect of this mission filled me with repugnance; but I affected to accept it with pleasure. [On my road], I fell in with the 'Awlād 'Arif [who appear to have been a branch of the Duwāwidah tribe which Ibn Khaldūn had been instructed to visit]; and they welcomed me with gifts and honours. I took up my abode with them; and they sent to Tilimsān to fetch my family and my children. They promised at the same time to represent to the Sultan that it was positively impossible for me to fulfil the mission with which he had charged me; and in fact they induced him to accept my excuses. Thereupon I established myself with my family at Qal'at ibn Salāmah, a castle situated in the country of the Banu Tujīn which was held from the Sultan by

¹ This was how 'Abd-ar-Rahmān ibn Khaldūn visited, for the first and last time, the home of his ancestors. 'When I arrived at Seville', he writes, 'I remarked a number of monuments of my ancestors' greatness'. Peter received 'Abd-ar-Rahmān with honour, and actually offered to reinstate him in his ancestral property if he would consent to enter his service—an offer which 'Abd-ar-Rahmān politely declined. (See the relevant passage from the *Autobiography* in de Slane's translation of the *Muqaddamāt*, vol. i, p. xliv.)

the Duwāwidah in feudal tenure. I remained there for four years, entirely free from worries and from the turmoil of public affairs; and it was there that I began the composition of my work [on universal history]. It was in this retreat that I completed the *Muqaddamāt*:¹ a work which was entirely original in its plan and which I made out of the cream of an enormous mass of research. When I settled at Qal'at ibn Salāmah, I installed myself in a large and solid suite of rooms that had been built there by Abu Bakr ibn 'Arif. During the prolonged stay which I made in this castle, I completely forgot the kingdoms of the Maghrib and of Tilimsān and thought of nothing but the present work.²

This light-hearted 'acquiescence', secured by chicane, was obtained in strangely different circumstances, and was accepted in a profoundly different spirit, from the three 'acquiescences' in the life of Clarendon. Yet the volatile Maghribī's single sojourn in Qal'at ibn Salāmah evoked a greater work of genius than anything that came of the sober Englishman's successive sojourns in Jersey and Madrid and Montpellier—and this notwithstanding the fact that Ibn Khaldūn's quadrennium in the wilderness was the solitary incident of the kind in the whole of his long career. For, when once he quitted the friendly walls of Qal'at ibn Salāmah, Ibn Khaldūn was sucked back into the turmoil of affairs; and he never extricated himself again.

From the author's own account, it is not clear whether scholarship or boredom was the magnet that drew him back into the World. It is only certain that he was not responding, like Clarendon, to the call of public duty.

'When I had finished the *Muqaddamāt* and passed on to the history of the Arabs and Berbers and *Zenāta*, I had a keen desire to consult a number of books and collections that are only to be found in great cities; and I had to correct and to make a fair copy of a work that had been dictated almost entirely from memory. . . . Impelled by the desire to visit the Sultan Abu'l-'Abbās and to set eyes again on Tunis, the home of my fathers, . . . I set to work to obtain from this prince his permission to re-enter the dominions of the Hafsid Government. Shortly after, I received letters of amnesty, with an invitation to join the prince forthwith; so I hastened on the preparations for my departure and took my leave of the 'Awlād 'Arif.'³

From that autumn of A.D. 1378 till his death in the spring of 1406, nearly twenty-eight years after, Ibn Khaldūn never found

¹ It is amusing to reflect that the great work on the philosophy of history which had been originally inspired in Ibn Khaldūn's mind by the portent of Arab barbarism in the Maghrib was actually composed under the aegis of the very barbarians who were the author's *bêtes noires*. We may conjecture that Ibn Khaldūn found means of excusing himself from reading aloud to his ingenuous hosts the biting satire on their ancestral way of life which he had been composing under their hospitable roof!

² Ibn Khaldūn: *Autobiography*, in op. cit., vol. i, pp. lxvii-lxviii.

³ Op. cit., vol. i, p. lxviii.

another haven where his mind could be 'entirely free from worries'. His experiment of returning to public life in his home country was not a success; and four years later he sailed from Tunis for Alexandria—never again to return to his native Maghrib. But this was one of the cases in which *caelum non animum mutant qui trans mare currunt*;¹ and, even in the stabler society of Egypt, Ibn Khaldūn contrived to enliven his old age with as many chances and changes as had given zest to his youth in the chaotic West. The high personal distinction which he had now attained only gave him so much the greater scope for making enemies; and in the twenty years ending with his death in A.D. 1406 he was no less than six times appointed to one of the four highest judicial posts of Cairo² and five times deposed—to die at last triumphantly in office, within ten days of his fifth reinstatement. In each successive tenure, he put his colleagues and rivals out of countenance by exposing with equal ruthlessness their venality in administering the law and their ignorance in interpreting it—a double humiliation for which they were unable to forgive him. Nor were these legal feuds the only sensational incidents in the Egyptian chapter of the Maghribī philosopher's life. On the eve of his first deposition, his whole family, with all his worldly goods, were lost at sea on their way from Ifriqiyah to join him in his new Egyptian home; and, in the interval between his second and his third tenure of his judicial office at Cairo, he had an encounter at Damascus with Timur the Lame³ which was a vastly more hazardous adventure than his youthful encounter, thirty-seven years before, with Peter the Cruel.

These were the turbulent circumstances in which 'Abd-ar-Rahmān ibn Khaldūn completed the life-work upon which he had embarked when he started to dictate his incomparable *Muqaddamāt*

¹ Horace: *Epistles*, I. xi. 27.

² The post of Qādi'l-Qudāt of the Mālikī School of Islamic jurisprudence.

³ Ibn Khaldūn's encounter with Timur was involuntary; for he seems to have been included more or less by *force majeure* in the suite of the Mamlūk Sultan Nāsir Nāsir-ad-Dīn Faraj when the Sultan marched out, towards the close of A.D. 1400, to dispute Timur's passage through Syria. The philosopher was deposited in Damascus while the Sultan went to meet his redoubtable adversary on the battle-field; but a brief engagement with the Transoxanian invaders was sufficient to damp the martial ardour of the Mamlūks; and their retreat was so precipitate that Ibn Khaldūn found himself, without warning, marooned in Damascus, with Timur's victorious army beleaguering the city. In this predicament, the resourceful philosopher headed a deputation from the citizens of Damascus to the conqueror's camp. (Since the enterprise was vetoed by the Mamlūk military governor of Damascus, Ibn Khaldūn and his fellow ambassadors made their exit from the city by having themselves let down over the city-wall with cords: a traditional Damascene expedient which had once saved the life of Saint Paul!) When the deputation found themselves in Timur's presence, Ibn Khaldūn contrived to engage Timur in conversation and then won the Emperor's heart by reciting to him the section of his *Universal History* in which he had recorded Timur's career up to date, with the request that Timur would deign to correct any errors of fact in the narrative! Timur treated Damascus with little less than his customary harshness, but he let Ibn Khaldūn depart to Cairo in peace. (For this encounter between Ibn Khaldūn and Timur, see the passages quoted from the original authorities by de Slane in op. cit., vol. i, pp. lxxxvi-xcii.)

328 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS during his creative 'acquiescence' at Qal'at ibn Salāmāh. The task of committing to writing the *Universal History* which was in his mind was not at an end until the Prolegomena had been followed by six further volumes; and we may conjecture that these last six-sevenths of the work might never have seen the light if the successful composition of the prelude, during those four exceptional years of tranquillity, had not inspired the philosopher with an impetus to write which persisted through the subsequent years of recurrent turmoil. We must add that the relative value of the different parts of the work as 'everlasting possessions' is not to be measured by any quantitative standard; and that if Posterity were confronted with the cruel choice between losing the first volume alone of Ibn Khaldūn's *Universal History* or saving the *Muqaddamāt* at the price of losing all the other six, we should unhesitatingly sacrifice the six volumes which the author contrived to compose after his re-emergence from Qal'at ibn Salāmāh in order to preserve the single volume which came to birth in that tranquil retreat. In fact, Ibn Khaldūn's life-work is the work which he accomplished in the four years devoted to creation out of half a century spent in a whirl of public activity. And the great philosopher's true return from his brief withdrawal was not the second chapter of practical life in which he emulated the vagaries of the first. In one aspect, the Ibn Khaldūn who bade farewell to Qal'at ibn Salāmāh in the autumn of A.D. 1378 reassumed, at Tunis and in Cairo, the role of the restless politician who had whimsically taken his congé from the Court of Tilimsān in the spring of A.D. 1375. In another aspect, the ephemeral man of affairs re-emerged from his retreat transfigured, once for all, into the immortal philosopher whose thought still lives in the mind of every reader of the *Muqaddamāt*.

Confucius

The same *motif* of Withdrawal-and-Return appears in the life of the Sinic social philosopher Confucius (*vivebat circa* 551-479 B.C.)—a life which was outwardly not unlike the life of Ibn Khaldūn.

Born into the Sinic World within a century of the breakdown of the Sinic Civilization,¹ at a time when the destructive internecine warfare between a plurality of sovereign states was rapidly gathering momentum, the young Confucius aspired to enter politics in order to arrest the disintegration of the Sinic Society by systematizing and enforcing the observance of its traditional ceremonies and customs and institutions. Unlike Ibn Khaldūn, who evidently took

¹ If this breakdown is to be dated by any external event, a convenient date is the outbreak of war, in 634 B.C., between the peripheral states of Tsin and Ch'u for the hegemony over the cluster of smaller states at the centre of the Sinic World. (See Maspéro, H.: *La Chine Antique* (Paris 1927, Boccard), p. 323.)

his politics lightly as a profitable and diverting outlet for his practical energies, Confucius placed his whole treasure in the life of practical action, and found little consolation in imparting to a band of admiring disciples the precepts which he yearned to put into practice as a minister of state. Hence Confucius's life was a life of personal disappointment;¹ for the local princes of the contending states had little use for the services of a pedant in their cynical and perilous struggle for existence. Accordingly, Confucius had difficulty in obtaining an official appointment at all; and when at last he did attain a minor administrative post in his native state of Lu (one of the smaller states of the centre), he did not succeed in retaining it. His resignation was followed by his withdrawal from his native country; and he spent the next fourteen years in a peripatetic way of life—presenting himself in the capital of one state after another in the hope that some foreign prince might offer employment to a prophet who had found too little honour at home. This hope was never fulfilled; and Confucius's wanderings abroad were only brought to an end by an invitation to return to Lu which was extended to him as an act of grace without any accompanying offer of reinstatement in office. By then Confucius was sixty-eight years old; and when death overtook him five years later he was still in a private station. But this disappointing return to his little native state of Lu at the close of his life in the flesh was not the final way in which Confucius returned to the public life which he had quitted *à contre-cœur* fourteen years earlier. For the energies which the unsuccessful administrator was no longer able to apply to practical affairs found their outlet thereafter through literary and educational channels.

Confucius in exile collected and edited the literary monuments of the traditional lore which Confucius in office had sought to put into practice; the disciples who gathered round the philosopher's person and accompanied him in his wanderings from place to place followed suit by collecting and editing their master's oral precepts; and some three and a half centuries after Confucius's death, when the long crescendo of internecine warfare between the contending states had ended in the 'knock-out blow' of 221 B.C., and when bitter experience had taught the Sinic World to appreciate the stabilizing power of the pedantic Confucian ethos, the *Corpus Confucianum* was actually adopted by the Government of a Sinic universal state as its official canon of statesmanship.² The final

¹ For a critical sifting of the attested facts in Confucius's life-history, see Maspéro, *op. cit.*, pp. 454-9. For the traditional biography, see Hirth, F.: *The Ancient History of China to the End of the Chou Dynasty* (New York (reprint of) 1923, Columbia University Press), pp. 241-8.

² See Hu Shih: 'The Establishment of Confucianism as a State Religion during the Han Dynasty' (in the *Journal of the North China Branch of the Royal Asiatic Society*,

step was taken in 125 B.C.,¹ when a competitive public examination in the Confucian Classics was instituted as the avenue of entry into the Imperial Civil Service; and the official reign of Confucius, which dates from that year, may be said to have lasted until the abolition of the examination system in A.D. 1905.

During these two thousand years, the posthumous ascendancy of Confucius survived the interregnum (*circa* A.D. 175-475) which followed the break-up of the Empire of the Han; it survived the influx of the barbarians, and the far more revolutionary influx of the Mahayana, into the new Far Eastern World; and it survived the latter-day barbarian invasions of Khitan and Kin and Mongol and Manchu. The one power that has ever seriously disputed the hold of Confucius over Chinese minds since the sage's ethereal reign began is the Civilization of the West, which is making its forcible impact upon the traditional life of China in the present generation. For the moment, maybe, the Western impact has driven Confucius from his millennial throne; yet, even if he has been officially deposed, the unconquerable sage is still contriving to govern where he no longer reigns by ruling incognito. For the essence of the Confucian social system, as it was instituted two thousand years ago, is government by students under the auspices of a sage whose personality and precepts are regarded with all the more veneration since the man of flesh and blood has departed this life and has received his apotheosis; and the lineaments of this system can still be detected in the life of a revolutionary China beneath all the scum and froth that have gathered on its agitated surface. In this twenty-eighth year after the abolition of the Confucian examinations, China is still being governed by students in a dead philosopher's name. The veneration long paid to Confucius has been transferred provisionally to Sun Yat-sen; and the borrowed prestige of the founder of the Kuomintang has secured the long-suffering acquiescence of the Chinese People in the conduct of public affairs by Dr. Sun's political legatees, who (to China's undoing) have received their education abroad in the social and physical sciences of the West, instead of being educated in the Confucian Classics like their predecessors for sixty generations. The moral and political bankruptcy of these Western-educated student-politicians of the Kuomintang may conceivably bring King Confucius back into his own again; and thus, even now, we cannot foresee the end of the mighty kingdom which this Sinic sage unwittingly acquired when he lost his official post in the petty principality of Lu.

vol. ix, 1929, pp. 26-7). See also Shryock, J. K.: *The Origin and Development of the State Cult of Confucius* (London 1932, Century Company).

¹ This is Hu Shih's date in *op. cit.*, p. 27. The date is given as 124 B.C. by Franke, O.: *Geschichte des Chinesischen Reiches*, vol. i (Berlin and Leipzig 1930, de Gruyter), p. 301.

Kant

The *motif* reappears in the life of a modern Western philosopher who was more academic than Confucius himself. Immanuel Kant of Königsberg (*vivebat* A.D. 1724-1804) withdrew from the World deliberately. Though he had to wait fifteen years to obtain a professorial chair in his native city, he steadfastly refused all calls to other universities. In all his life, he never travelled more than forty miles from his birthplace or took a voyage upon the waters of the Baltic on whose shores he lived; and the daily round of his activities was so monotonously regular that the townspeople learnt to set their watches by his punctual passage past their windows on his daily 'constitutional' walk. Yet within his own lifetime the retiring philosopher lived to draw a host of students to the outlying Prussian city from which he refused to move; and the insignificant-looking man who never transported his body more than forty miles has radiated his thought from Königsberg to the ends of the Earth.

Dante

When we turn our attention from the philosophers to the poets, we find the same *motif* in the life-history of Dante (*vivebat* A.D. 1265-1321). For this greatest of all Florentines did not accomplish his life-work till he had been driven to withdraw from his native city. In Florence, Dante fell in love with Beatrice, only to see her die before him after marrying another man. In Florence he went into politics, only to be sentenced to exile.¹ And from this banishment the Florentine *exul immeritus*² never returned in the flesh. Yet, in losing his birthright in Florence, Dante was to win the citizenship of the World; for, in exile, the genius which had been crossed in politics after being crossed in love found its life-work to achieve in creating the *Divina Commedia*.³ To judge by an allusion in the first ode of Paragraph Nineteen of *La Vita Nuova*,⁴ the first

¹ Dante was a philosophic Ghibelline, who broke away from the prevailing Guelf tradition of Florence because he divined—two centuries before Machiavelli—that the supreme political need of the Italian Society was for some supreme authority to bring peace and order into the relations between the contending city-states. While Machiavelli looks for an Italian dictator to be his saviour of Italian Society, Dante, in his less sophisticated generation, feels no repugnance against calling in a 'barbarian' to perform the same service for Italy in the traditional role of a Holy Roman Emperor.

² 'Dantes Aligherius Florentinus et Exul Immeritus' is the superscription over four out of ten extant letters written by Dante in exile.

³ Dante was condemned to exile *in absentia* (under pain of death if he returned) on the 10th March, 1302. He is believed to have composed the *Divina Commedia* in exile during the last seven years of his life (A.D. 1314-21). The date in which the action of the poem is placed in the poem itself is A.D. 1300, when the poet was still living in Florence; but this date, which represents the middle-point of Dante's life on the conventional lifespan of three-score years and ten, is evidently fictitious.

⁴ Dante: *La Vita Nuova*, § 19, Canzone Prima, ll. 45-7:

Là, ov' è alcun che perder lei s'attende,
E che dirà nell' Inferno a' malnati:
'Io vidi la speranza de' beati.'

332 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
conception of the *Commedia* must already have arisen in Dante's mind before the death of Beatrice in A.D. 1290. Yet it was not until a quarter of a century later, when Beatrice had been twenty-four years in her grave and Dante himself twelve years in exile, that the extinction of the Florentine statesman's last political hopes, by the death of the Emperor Henry VII in A.D. 1314, at last set the poet free to escape from the trammels of Time and Space into the writing of his ageless and deathless masterpiece.

Hamlet

We may conclude our survey of the working of Withdrawal-and-Return in the lives of individuals by reverting from the realm of fact to the realm of myth from which we started, and contemplating the hero of a Scandinavian myth who has been transfigured by the genius of Shakespeare into the archetype of 'the intellectual'. In Shakespeare's tragedy of *Hamlet*, the dreamstudent of Wittenberg is suddenly confronted, by the revelation of his mother's guilt, with the prospect of having to do the deed of Orestes. In face of this dreadful challenge, which finds him unfitted by temperament and unprepared by experience for making the response that his conscience demands, Hamlet does not resort to a physical withdrawal from the tragic scene in the fashion of his Hellenic counterpart. Orestes is conveyed away secretly, as a child, from the clutches of his mother and her lover and is brought up in distant Phocis in order to return to Argos in his manhood as his father's avenger. Since his earliest memory, Orestes has grown up with the knowledge that this is the deed which it has been laid upon him to do. Hamlet learns his fate by a sudden intimation at an age when he has already passed the threshold of maturity; and the manner in which he withdraws in order to return is characteristically different. Understanding, from the first, that his spiritual agony cannot be escaped by physical flight, he deliberately assents to his mother's request that he stay in Denmark instead of returning to Wittenberg; and thereupon he withdraws—on a far longer spiritual voyage—into the innermost depths of the Microcosm, in order to return to the Macrocosm, in the fullness of time, transformed, for the Orestian deed, into a demonic 'man of action'.

Puberty

Having now completed our survey of Withdrawal-and-Return in the lives of individuals, we may trace the same *motif* in the histories of minorities.

The *motif* presents itself conspicuously in the case of one minority of a natural order which always exists of necessity in every society: the minority consisting of those male members of any given society

who, at any given moment, are in course of passing out of boyhood into manhood through the metamorphosis of puberty. The withdrawal of the boys from the common life of Society on the eve of puberty in order that they may return as men when they are ripe for marriage is a social movement which is not only common in the life of primitive societies, but is also traceable in the lives of societies that are in process of civilization—sometimes as a theme of Mythology and sometimes as a custom that lingers on in practice in some by-way of practical life. The temporary segregation of the boys of a primitive society during their years of puberty is a commonplace of Anthropology.¹ The reflexion of this custom in Mythology is illustrated by the Hellenic myth of the Centaur Cheiron's school of heroes in the wilderness of Mount Pelion. Its survival, as 'a going concern', into the history of a civilization is illustrated by the Spartan institution of the so-called 'Lycurgeoan Agôgê' and by the English institution of the so-called 'Public Schools'.²

Penalized Minorities

Other illustrations of the same *motif* are to be found in the experiences of some among those 'penalized minorities' whose histories we have already surveyed in another connexion.³

In the history of Jewry, for example, in face of the challenge presented by the impact of Hellenism, the Pharisees withdrew⁴ in the second century B.C. not only from the cultural movement of Hellenization which had been unsuccessfully promoted by the High Priest Joshua-Jason but also from the triumphant military and political reaction against the Hellenic Seleucid Power which was captained by the Maccabees. And then, in the first century of the Christian Era, the greatest Pharisee that ever lived returned from this two-centuries-long segregation, with a mighty spiritual impetus, to sweep away all cultural barriers between Jew and Greek⁵ by preaching the transfigured Judaism of Jesus as a means of salvation for the whole of Humanity.⁶

¹ For a survey of the prevalence of this institution in the lives of extant primitive societies, see Schurz, H.: *Altersklassen und Männerbünde* (Berlin 1902, Reimer).

² For an examination of the Lycurgeoan Agôgê and its analogies in the English 'Public Schools', see Part III. A, above. It is to be noted that while the English boy who is segregated from his family on the eve of puberty by being sent to a 'public school' does return to ordinary life upon reaching manhood, the Spartiate never returns, after his entry into the Agôgê at the age of seven, until he is superannuated from military service at the age of sixty.

³ In II. D (vi), vol. ii, above.

⁴ The name 'Pharisees' literally means 'those who separate themselves'.

⁵ Col. iii. 11.

⁶ For the *motif* of Withdrawal-and-Return in the personal life-history of Paul, see the present chapter, pp. 263-4, above. It is to be noted that the particular Pharisee who accomplished this Christian return from the Pharisaic withdrawal was an exceptional individual. The rank-and-file of the Pharisaic minority of Jewry marched into the same blind alley as the rank-and-file of the Spartiate soldiers and the Hellenic philosophers. They duly withdrew, but they never made their withdrawal fructify by returning in new capacities to create new worlds.

In a similar movement, the Nestorians withdrew, under pressure from the following wave of Islam, right out of the domain of their native Syriac Society into the remote interior of the Eurasian Steppe; and thence in due course they returned as conquerors on the crest of the wave of the Mongol invasion.¹ The Constantinopolitan Greeks, driven out of public life by the Ottoman conquest, withdrew into the realm of private business in order to emerge again into public life, some two centuries later, as the Phanariots—the efficient secretaries of state whose business training made their political services indispensable to the Ottoman Government in its hour of adversity.² The English Nonconformists,³ who had made their stormy entrance on to the stage of English history in the Civil War and the Commonwealth, thereafter withdrew and returned in somewhat similar circumstances to those that evoked the corresponding movement among the Ottoman Greek Orthodox Christians. Dropping out of public life from the morrow of the Restoration until the eve of the passage of the Reform Bill,⁴ they likewise reacted by withdrawing into the realm of private business in order to return omnipotent, a century and a half later, as the authors of the Industrial Revolution.⁵

¹ See II. D (vi), vol. ii, pp. 236–8, above.

² Ibid., pp. 222–8, above.

³ Ibid., pp. 220–1 and 250, above.

⁴ The exclusion of the Nonconformists from public life may be dated from the passage of the Corporation Act in A.D. 1661 and the Test Act in A.D. 1673. Their readmission may be dated from the repeal of these two Acts in A.D. 1828.

⁵ In the examples of Withdrawal-and-Return here cited from the histories of certain 'penalized minorities', the two beats of the movement make a sequence in Time—the withdrawal coming first and the return following after a perceptible Time-interval. But there is also a sense in which the very response of a penalized minority to the challenge of penalization is in itself an example of Withdrawal-and-Return, even when the two beats of the movement are virtually simultaneous. Some of the most conspicuous representatives of the 'penalized minorities'—e.g. the Jewish Diaspora—have never returned at all in the literal sense; but in the ethereal sense they undoubtedly have returned to the World in a new capacity and with enhanced power in the act of concentrating their social energies on other fields, and excelling in these fields, in response to the challenge of being handicapped in, or altogether excluded from, the most highly regarded fields of social activity. (See II. D (vi), vol. ii, p. 209, above.)

This 'timeless' exhibition of the Withdrawal-and-Return *motif* is characteristic of what may be called the 'institutional penalized minorities': e.g. the Buddhist and Christian monastic orders or the Roman Catholic celibate clergy. It is indeed a common practice in primitive societies to penalize, by the imposition of tabus, those minorities or individuals who serve as institutions incarnate. The notion underlying this practice seems to be that, the more drastically such incarnate institutions are compelled to withdraw from the ordinary activities of social life, the more vigorously they will return to Society on the plane of magical or religious activity which has been assigned to them as their special field. In fact, their fellows deal with them as the man with the pollarding-axe deals with the willow (See I. C (iii) (b), vol. i, p. 168, above) or the pruner with the vine or the mower with the meadow. A classic example of such compulsory withdrawal being imposed upon an incarnate institution by tabu is the treatment of the Toda 'palol', or sacred dairyman, by the pastoral Toda Society of the Nilgiri Hills in Southern India. (See Rivers, W. H. R.: *The Todas* (London 1906, Macmillan), pp. 98–105.) The 'palol', who is solely charged with the management of the sacred dairy, is not allowed to visit his home or any ordinary village. He has to do all his business with ordinary people through an intermediary. He may not cross a bridge. He must be celibate (except in the celebration of his eighteenth year of office). He may not attend a funeral under pain of having to resign his office. He may not be approached at all by ordinary Todas on two days

Barbarian Rear-guards

The *motif* reappears in the histories of other minorities which we have already had occasion to examine in the course of this Study.

We have seen, for example, how the Celtic and Teutonic rear-guards of the European Barbarism parted company with the van-guard and held themselves in reserve when the van-guard threw itself upon the derelict provinces of the Roman Empire in the *Völkerwanderung* of *circa* A.D. 375-675; and we have noted the historic difference in the outcome of these two alternative barbarian strategies. The barbarian van-guard, recklessly rushing in, was easily and rapidly overcome by the internal proletariat of the defunct Hellenic Society, which was able, through the institution of the Catholic Church, to deliver an irresistible counter-attack on its own ground.¹ On the other hand, the Celtic and Teutonic rear-guards, which held aloof and concentrated their efforts in the first instance upon begetting embryonic civilizations of their own, were able to contend with Catholic Christendom on equal terms when they emerged from their withdrawal at last in their own good time. In the embryonic Far Western Christian Civilization of the Irish and the embryonic Scandinavian Civilization of the Vikings, the Catholic Church found adversaries of a very different metal from the temper of the Goths and the Franks, which had been as flexible as the iron of a Galatian sword-blade. And there were moments in the seventh century of the Christian Era, and again in the ninth, when it was really an open question which of two contending Powers would win for itself the privilege of giving birth to the future civilization of the West.² In the narrowness of the margin by which the abortive Far Western Civilization and the abortive Scandinavian Civilization were defeated in their struggle with the Catholic Church we have the measure of their superiority over the Gothic Barbarism from which they had parted company; and this

in the week. Neither he nor his dairy must be touched by any ordinary person. He may not cut his hair or nails. Compare the tabus imposed upon the Grand Lama in Tibet. And compare likewise the role of 'the prisoner in the Vatican' which, in modern Western Christendom, has been played by the Pope for more than half a century, from A.D. 1870 to A.D. 1929. As 'the prisoner in the Vatican', the Pope has been able to move the feelings and imaginations of Roman Catholics all over the World more powerfully than he had ever moved them when he was the temporal sovereign of an Italian principality extending from the Mediterranean to the Adriatic and from the Po to the Garigliano. At the time of writing, it remains to be seen what will be the ultimate psychological consequences of the Lateran Agreements of 1929 between the Holy See and the Kingdom of Italy, under which 'the prisoner in the Vatican' has emerged from his masterly captivity to resume the role of a territorial sovereign over the miniature territory of the Vatican City. (For the Lateran Agreements, see further Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs for 1929*, Part V (i).)

¹ See II. D (vii), vol. ii, pp. 320-1, above.

² For the successive combats in which the Roman Church had to engage with the embryonic Far Western Christian Civilization and the embryonic Scandinavian Civilization for the privilege of becoming the embryo of our modern Western Civilization, see II. D (vii), vol. ii, pp. 322-60, above.

336 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
superiority can be traced to the special impetus which the two barbarian rear-guards acquired, before coming into action, from their previous movement of Withdrawal-and-Return.

Athens in the Second Chapter of the Growth of the Hellenic Society

A still more conspicuous example of Withdrawal-and-Return, which has come to our attention repeatedly,¹ is the behaviour of the Athenians in the crisis into which the Hellenic Society was thrown by the presentation of the Malthusian challenge in the eighth century B.C.

We have noticed that the first reaction of Athens to this problem of over-population was ostensibly negative. She did not react to the pressure of over-population, as her neighbours Eretria and Chalcis and Corinth and Megara reacted to it, by seizing and colonizing new agricultural land overseas; and she did not react, as the Spartans reacted, by conquering the territories of adjoining Greek city-states and turning the Greek inhabitants into serfs.² In this age, so long as her neighbours were content to leave Athens alone, Athens was content to play an apparently passive role on a Hellenic stage on which the action was all the time becoming more intense all around her. The first glimpse of her demonic latent energy that she gave to the rest of Hellas was in her violent and victorious reaction against King Cleomenes' attempt, towards the close of the sixth century B.C., to bring her under the Lacedaemonian hegemony, as his predecessors had brought the Isthmian states.³ And

¹ See vol. i, pp. 24-5; vol. ii, pp. 37-42; and vol. iii, pp. 122, 139-40, 197, above.

² The definitive boundaries of Attica as they had been established by Solon's time, at the turn of the seventh and sixth centuries B.C., certainly embraced an area which was exceptionally large for a Continental Greek city-state (the territorial scale of the Greek colonies in Magna Graecia and Sicily was distinctly larger than that of the mother-states in Continental Greece). In fact, Attica was by far the largest city-state territory in Continental Greece with the one exception of the territory of Sparta. Yet there is no indication, either in tradition or from presumptive evidence, that Attica was a product of conquest. It is probable, though unattested, that Eleusis was originally an independent city-state; but, if so, the unrecorded act of union between Eleusis and Athens must have been an agreed measure, on a footing of equality, like the union of A.D. 1707 between Scotland and England. The sole apparent exception to the pacific process by which Attica grew is the acquisition of the Island of Salamis from Megara by force of arms; but this did not become a precedent. When Athens next extended her territorial sphere on the Continent by the attachment of Plataea, she attached her, not as a conquered and recalcitrant enemy, but as an enthusiastic and devoted ally.

³ The Lacedaemonian Government attempted to establish its ascendancy in Athens, as it had established it in Corinth and Sicyon and Epidaurus and Megara, by overthrowing a local despotic régime and setting up in its place a more or less reactionary oligarchy which could only make itself secure against a restoration of the radical despotism by continuing to lean upon Lacedaemonian support. When King Cleomenes applied this policy to Athens, he was successful in the first step. In 511 B.C., a Lacedaemonian expeditionary force duly expelled the despots of Athens and set up an oligarchy in their stead. But at Athens this was not the end of the story. The local restoration of the oligarchy was followed here by a struggle for power between the moderates and the extremists; in 508 B.C. the leader of the moderates, Cleisthenes, gained the upper hand by 'taking the Dêmos into his party' (Herodotus, Bk. V, ch. 66); the extremists appealed to Sparta; and Cleomenes led a new Lacedaemonian military expedition to Attica with surprising consequences. When he put the Athenian extremists back into power and drove

thus, by her passive non-participation in the general movements of the age, and by her active resistance to any attempt to coerce her into conformity, Athens more or less deliberately segregated herself from the main body of the Hellenic World for upwards of two centuries. Yet these two centuries of Athenian withdrawal were not centuries of Athenian inactivity. On the contrary, we have seen how Athens took advantage of this long seclusion, which left her free from foreign entanglements, to concentrate her energies upon solving the general Hellenic problem of over-population by an original solution of her own—an Athenian solution which proved its superiority by continuing to work when the Spartan solution and the Chalcidian solution were bringing in diminishing returns. It was only in her own good time, when she had remodelled her traditional institutions to suit her newfangled way of life, that Athens at last returned to the arena from which she had so long absented herself. But when she returned in these circumstances, she returned with an impetus that was unprecedented in Hellenic history.

Athens proclaimed her return by the sensational gesture of throwing down the gauntlet to the Achaemenian Power. It was Athens who responded—when Sparta hung back—to the appeal of the Asiatic Greek insurgents in 499 B.C.; and from that day onwards Athens stood out as the protagonist in the Fifty Years' War (*gerebatur* 499–449 B.C.) between Hellas and the Syriac universal state. For upwards of two centuries from the beginning of the fifth century B.C., the role of Athens in Hellenic history was the absolute antithesis of the role which she had been playing for an equal period of time before.¹ From the outbreak of the Ionian Revolt in

the moderates into exile, he was answered by a general rising of the population of Attica; he found himself blockaded, with his little expeditionary force, in the citadel of Athens; and he was compelled to capitulate on condition of evacuating Attica unconditionally. Thereupon, Cleisthenes returned and immediately introduced his famous democratic constitution. In 507 B.C., Cleomenes sought to avenge this humiliation by unleashing against Athens her three strongest neighbours: Thebes, Chalcis, and Aegina. But, in face of this fresh attack, the Athenians displayed their latent energy once again. On land, they decisively defeated the combined Theban and Chalcidian forces in a single campaign (after which they dealt with Chalcis as Sparta had dealt with Messene). At sea, they successfully carried on a desultory naval warfare against the Aeginetan seapower for some twenty years, until the imminence of Xerxes' great offensive against European Greece put a temporary stop to local inter-state hostilities.

¹ In the earlier period of Athenian history, the prevalent Athenian policy was only departed from by the despot Peisistratus, who anticipated, in the third quarter of the sixth century B.C., the Athenian imperialism of the fifth century by attempting to secure strategic and political and economic control over the two key-points in the Aegean area: the Black Sea Straits and the mouth of the River Strymon together with the mineral deposits of Mount Pangaeus. Peisistratus found his opportunity at Athens because his predecessor Solon had insisted upon implementing the Solonian economic policy by non-revolutionary methods which worked too slowly for the stress of the times. On the whole, Peisistratus came to fulfil the Solonian programme and not to destroy it; but he used his despotic power in order to 'speed up' the agrarian reconstruction of Attica by revolutionary methods. After his final triumph, he appears to have taken a leaf out of the Spartans' book and to have carried out in Attica an internal redistribution of landed property at the expense of the defeated and exiled aristocrats.

338 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
499 B.C. down to the end of the Chremonidean War in 262, Athens was always in the thick of the mêlée of Hellenic international politics; and it was not until she found herself hopelessly out-classed by the new titans of the periphery that she reluctantly renounced the status and the burdens of a Hellenic Great Power. Nor was her would-be withdrawal from the arena of international politics after her final overthrow by Macedon in 262 B.C. the end of her active participation in the general life of the Hellenic World. For, long before she fell behind in the military and political race, she had made herself 'the education of Hellas' in every other field. She had given the Hellenic culture a permanent Attic impress which it still retains in the sight of Posterity.

Ionia in the First Chapter of the Growth of the Hellenic Society

In the history of Athens, we have discerned our *motif* of Withdrawal-and-Return in the creative activity of a minority which taught the Hellenic Society how to continue its growth by teaching it how to solve one of its crucial problems. Athens made herself 'the education of Hellas' in the literal sense by discovering how to solve the general Hellenic problem of over-population by a special Athenian method of intensive economic development. We have seen, however, at an earlier point,¹ that this Malthusian challenge which received an Athenian response was not the first crucial challenge with which the Hellenic Society had been confronted in the course of its history. The Malthusian challenge was actually evoked by the previous success of the Hellenic Society in replying to the prior challenge of Chaos. And it is natural to inquire whether, in this first chapter of Hellenic history, we can detect the same *motif* of Withdrawal-and-Return that is apparent in the second. We have seen that this primary challenge of Chaos was victoriously met in Hellenic history by the invention of the city-state: an institution which enabled the relatively orderly and progressive population of the rare and narrow plains to establish their ascendancy over the wild highlanders. Was the Hellenic city-state, like the later Hellenic economic system of specialized production for export, the invention of some creative minority which temporarily withdrew from the rest of the Hellenic Society, like Athens in a later age, in order to return in its own good time with a solution of a common problem which it had worked out for itself in its period of retreat?

We are here in the realm of conjecture; for we have no contemporary records of this first chapter of Hellenic history; but in

¹ In Part III. B, on pp. 120-1, above.

an earlier passage of this Study¹ we have found some reason for believing that the Hellenic city-state was originally invented, at the end of the post-Minoan Völkerwanderung, by those refugees from the 'Dorian' avalanche who parted company from their neighbours in Continental Greece by taking to their ships and finding new homes overseas on the coast of Anatolia. The transmarine migration which brought into existence the historic city-states of Aeolis and Ionia and Doris may fairly be regarded as a 'withdrawal' in our present usage of the term; and there are indications, as we have seen, that the historic city-states of Continental Greece were later foundations which were established on the overseas pattern artificially by mimesis. If we have interpreted these indications aright, then the eventual 'return' of the transmarine settlers into full communion with the rest of the Hellenic Society may be traced in the spread of the new institution of the city-state over the greater part of the Hellenic World. And, whether or not the Hellenic city-state can properly be regarded as a specifically Ionian invention, it is beyond dispute that there was an Ionian 'return' in the cultural if not in the political sphere. The monument of this return is the historic conquest of Continental Greece by the Ionian Epic,² which became 'an everlasting possession' of all Hellas. In fact, the Hellenic culture had received a definitely Ionian impress before Athens withdrew and returned to give it the Attic impress which it subsequently bore. Nor, even then, did the second impress wholly efface the first; for, although the Attic *êthos* and the Ionian *êthos* were notably different,³ the Athenians did not begin to perform original acts of creation on their own account until they had saturated themselves with the Ionian spirit. The Athenian poet Aeschylus himself, in whom the Attic Promethean *élan* is incarnate, is content to describe his plays as 'slices from Homer's banquets';⁴ and it was the Athenian 'reception' of the Ionian Epic that secured for the *Iliad* and the *Odyssey* an unchallenged supremacy in the realm of Greek literature as 'the Hellenic Bible'—a supremacy from which the Ionian 'Homer' was never to be ousted by any of his Attic successors.

The Achaean Confederacy in the First Chapter of the Disintegration of the Hellenic Society

Thus it would appear that, in each of two successive chapters in the history of the growth of the Hellenic Civilization, a challenge

¹ In II. D (iii), vol. ii, pp. 97-8, above.

² *Ibid.*, pp. 94-6, above.

³ See the illuminating analysis of the difference, as it comes out in a comparison of the Aeschylean with the Homeric treatment of an originally identical theme, in Murray, Gilbert: *The Rise of the Greek Epic*, 2nd ed. (Oxford 1911, Clarendon Press), pp. 289-95.

⁴ Athenaeus 347 E, quoted in this Study already in vol. i, p. 449, footnote 1, above.

was met by the withdrawal and return of a creative minority which withdrew temporarily from the rest of Society in order to discover an original solution for the common problem and then returned in the fullness of time in order to communicate to the rest of Society the solution which it had duly discovered during its temporary retreat. In the growth-phase of the Hellenic Society, there are no more chapters than these two, since the growth of the Hellenic Civilization was brought to an end by a failure to meet the next challenge—the challenge of international anarchy—which the Athenian response to the Malthusian challenge evoked in its turn.¹ The consequence was the breakdown of 431 B.C. and the long disintegration which followed; but this disintegration was not a constant process. It consisted in an alternation of lapses and rallies and relapses;² and in the first rally the *motif* of Withdrawal-and-Return appears again.

One of the features of this first Hellenic rally was an attempt to solve a problem which had been presented to the central states of the Hellenic World by the renewal of the process of geographical expansion—the problem of saving the central states from being not only dwarfed but overwhelmed by the rise of new Great Powers of titanic calibre on the expanding periphery. Athens; as we have seen, had confessed herself worsted by this problem when she sought to retire from active participation in international politics after her last disastrous experience in the Chremonidean War of 266–262 B.C. In her foregoing attempt to pose among the titans as the Great Power which in their presence she had ceased to be, Athens had not succeeded in adding a cubit to her stature. She had merely exposed herself to being treated—and sacrificed—as a pawn in the war-game between giant Antigonos and giant Ptolemy. When she shook herself free at last from Macedonian military occupation in 228 B.C., her impulse, upon which she acted, was to repeat the gesture of withdrawal which had turned out so fortunately for her when she had made it for the first time some five centuries earlier. By this time, however, there were other statesmen in Greece who perceived that, in the new Hellenic World which had been called into existence by Alexander the Great, the little city-states at the centre were so utterly at the mercy of the titans round about that they were not even free to withdraw from

¹ The Athenian response to the Malthusian challenge of over-population was to obtain an enhancement of local productivity by specializing in production for exchange; but this economic solution of an economic problem confronted the Hellenic Society with the new political problem of establishing some international system of political peace and order as a framework for an international system of economic interdependence. This was the problem which the Hellenic World failed to solve. (See Part III. B, p. 122, footnote 3, above, and IV. C (iii) (b) 10, vol. iv. pp. 206–14, below.)

² For the movement of Lapse-and-Rally-and-Relapse in the disintegrations of civilizations, see V. C (ii) (b), vol. vi. pp. 278–321, below.

the field at their pleasure. They were no longer actors on a stage; they were pawns on a board; and the all-powerful players of the diplomatic and military game would replace them on the board, and sacrifice them once again, whenever this might happen to suit their convenience. If the city-states of Greece were to recover their freedom even to withdraw, they could only hope to succeed by joining forces in order to establish in the heart of Greece a confederacy of city-states which would be sufficiently strong to compel a Macedon or an Egypt to respect its neutrality. This was the policy of the statesmen who attempted to turn the ancient parochial Achaean Confederacy into a wider union.¹ We need not enlarge upon this policy here, for we have noticed it already in our inquiry into the social milieu of Polybius.² We need only mention that in this instance the movement of withdrawal was followed by no movement of return because the policy of Aratus failed and the first rally of the Hellenic Civilization broke down into a relapse.³ Yet in the policy which Aratus pursued with persistence and success for a quarter of a century, from 251 B.C. to 225, the first beat of the familiar rhythm is unmistakably recognizable.

Italy in the Second Chapter of the Growth of the Western Society

We have seen that Aratus in Greece was at grips with a problem of the Balance of Power which likewise exercised Machiavelli in Italy;⁴ and we have also seen that both statesmen's efforts ended in failure. But in one important respect the two situations were different. While Aratus, in the third quarter of the third century B.C., was attempting to extricate the city-states of Greece from an entanglement with the Great Powers of the periphery from which they had been suffering for the best part of a century without ever having succeeded in shaking themselves free, Machiavelli, at the

¹ For the failure of both Athens and Sparta, the *ci-devant* leaders of Greece, to take the lead in this later chapter of Hellenic history in a movement which was manifestly the sole chance of salvation that Greece still had open to her, see, further, IV. C (iii) (c) 2 (x), vol. iv, pp. 265-6, below. In the critical year 228 B.C., Athens refused to join the Achaean Confederacy and Sparta went to war with it!

² See the present chapter, pp. 310-14, above.

³ The policy of Aratus came to grief in 228 B.C., when the Achaean federal movement came into collision with the Spartan revolutionary movement. There was not room for both movements in the Peloponnese; and when Aratus found himself being worsted by Cleomenes, he undid his own life-work by purchasing the military assistance of Macedon in 225-224 B.C. at the price of allowing the Achaean Confederacy to become a Macedonian pawn. The joint Achaean and Macedonian war against Sparta (224-222 or 223-221 B.C.) was immediately followed by a joint Achaean and Macedonian war against the Aetolian Confederacy—the rival of the Achaean Confederacy which had been attempting to carry out the Aratean policy round a different nucleus for a whole generation before Aratus himself had appeared in the field. The last hope of extricating Greece from the internecine warfare between the titanic Powers of the periphery disappeared in 212 B.C. when the Aetolians involved Greece in the Hannibalic War by entering into an alliance against Macedon with the Romans.

⁴ For a general exposition of this problem, see the present chapter, pp. 301-6, above.

turn of the fifteenth and sixteenth centuries of the Christian Era, was attempting to preserve for the city-states of Italy an immunity from molestation on the part of Transalpine Europe which they had actually enjoyed, without any serious break, for more than two centuries before the apparition of Charles VIII in A.D. 1494. In other words, the withdrawal of Italy from the international politics of Transalpine Western Christendom, unlike the attempted withdrawal of third-century Greece from the international politics of the Macedonian 'successor-states', was not a pathetically abortive gesture but a successfully accomplished fact. In this respect it is comparable, not to the Achaean movement in the third century B.C., but rather to the withdrawal of Athens in the eighth, seventh, and sixth centuries B.C. which we have been studying in this chapter already.

On a comparative view, we can see that the Athenian withdrawal of the eighth, seventh, and sixth centuries B.C. and the Italian withdrawal of the thirteenth, fourteenth, and fifteenth centuries of the Christian Era display a strong resemblance to one another. In both cases, the withdrawal—on the political plane—was complete and persistent. In both cases, the self-segregating minority devoted the energies that were liberated by its release from foreign political entanglements to the task of finding an original solution of its own for a problem that confronted the whole of Society. And in both cases the creative minority returned to the Society which it had temporarily abandoned in the fullness of time, when its work of creation was accomplished, in order to set its impress upon the whole body social. We have already noticed how the Hellenic Society took an Attic impress after the return of Athens at the beginning of the fifth century B.C. We may now remind ourselves that our own Western Society took just as strong an Italian impress when Italy returned—not voluntarily, but under protest—at the beginning of the *Cinquecento*.

Moreover, the actual problems which Athens and Italy solved, in retreat, on their respective societies' behalf were much the same. Like Attica in Hellas, Lombardy and Tuscany in Western Christendom served, after withdrawal, as a segregated social laboratory in which the experiment of transforming a locally self-sufficient agricultural society into an internationally interdependent commercial and industrial society was successfully carried out. And in the Italian, as in the Athenian, case there was a radical remodelling of traditional institutions in order to bring them into conformity with the newfangled way of life. A commercialized and industrialized Athens changed over, on the political plane, from an aristocratic constitution based on birth to a bourgeois con-

stitution based on property.¹ A commercialized and industrialized Milan or Bologna or Florence or Siena changed over from the prevalent Feudalism of medieval Western Christendom to a new system of direct relations between individual citizens and locally sovereign governments whose sovereignty resided in the citizens themselves. These concrete economic and political inventions, as well as the impalpable and imponderable cultural creations of the Italian genius, were communicated by Italy to Transalpine Europe from the close of the *Quattrocento* onwards.

At this stage, however, the respective courses of Western and Hellenic history diverge in consequence of one essential point of dissimilarity between the position of the Italian city-states in Western Christendom and the position of Athens in Hellas. Athens was a city-state which had withdrawn from a society of city-states in order to return to a society that had not ceased to consist of city-state units. And accordingly, when Athens became 'the education of Hellas', the process of education was facilitated by the fact that the creative minority and the imitative majority had one important feature in common. They were both alike organized on the city-state pattern; and thus, while the non-Athenian majority of Hellas had to change over from agriculture and aristocracy to industry and democracy in order to catch up with the progress that the creative Athenian minority had made, the majority was not required to make any change in the nature or the scale of the local communities into which it was articulated. It was merely a question of changing a number of agricultural aristocratic city-states into the same number of industrial democratic city-states. There was no question of altering the city-state basis which was the common social heritage of Athens and her Hellenic neighbours.

In the relations between the creative Italian minority and the non-Italian majority of Western Christendom, the problem of assimilation was more difficult because in this case there was no corresponding common ground between the two parts of Society. For the city-state pattern, on which the Italian minority was organized, was not the original basis of articulation in Western Christendom. The original basis—the basis on which Western Christendom, in the first chapter of its history, had met the challenge of Chaos and had triumphed over the rival Scandinavian

¹ This change, which was made in principle, and indeed in substance, by Solon himself at the beginning of the sixth century B.C., was the really radical change in the constitution of Athens. Compared with this, the transition from oligarchy to democracy which followed in the course of the next century-and-a-half was secondary. When once the change of basis from the birth-qualification to the property-qualification had been made, Athens was a potential democracy already. It was merely a question of lowering to zero the amount of the property-qualification for the exercise of political power without any further change in its essential nature.

Civilization—was not the city-state but Feudalism.¹ The city-state, in fact, was not one of the original institutions of the Western Society. In Western history, the city-state only emerged in the second chapter; and then it emerged as a newfangled institution of the minority which withdrew and returned in this age. The withdrawal of the Italian minority from political entanglements with Transalpine Christendom was accompanied by a change-over, on the part of the self-segregating Italian communities, from a feudal to a city-state basis. This change in the basis of social articulation was one of the most conspicuous ways in which the Italians differentiated themselves from the majority of Western Christendom in their temporary retreat.² There was no simultaneous change in the same sense in the social structure of the Western Society at large; and when the creative Italian minority returned in due course to become 'the education of Western Christendom', the greater part of the Western World was still organized on the original feudal basis, and not on the new city-state basis on which the Italians had built their new model for a progressive Western Society.

This situation presented a problem to Western Christendom for which, *a priori*, there were two conceivable alternative solutions. In order to place itself in a position to adopt the new social inventions which Italy had to offer, Transalpine Europe might either break with its feudal past and rearticulate itself throughout on the Italian city-state basis; or else it might modify the Italian inventions in such a way as to make them workable on the feudal basis and on the kingdom-state scale of the old-fashioned Transalpine World. Theoretically, the problem might be solved along either of these lines. The only thing that was not practically possible was for the Italian inventions, as they stood, to be applied in the Transalpine kingdoms, as they stood, without some far-reaching measure of adaptation on the one side or on the other. In the event, the city-state articulation of the Italian minority was rejected and the Italian inventions were only adopted in Transalpine Europe in so far as they could be applied on the kingdom-state scale. But the alternative solution of rearticulating Transalpine Europe into an Italianized society of city-states was not left untried; and although the experiment eventually proved abortive, it was carried a considerable distance and came within sight of success before it irrevocably failed.

Northern Italy, in fact, was not the only place in Western

¹ See II. D (v), vol. ii, pp. 199-200, and III. C (i) (d), p. 196, above.

² For the emergence of the institution of the city-state in the Italian part of medieval Western Christendom as a 'throw-back' to the 'apparented' Hellenic Society on the part of the 'affiliated' Western Society, see Part X, below.

Christendom in which, during the second chapter of Western history, a creative minority extricated itself from the general political life of the Western Society by building city walls and learning to live a new life of its own behind them. While Italy was the region in which this movement declared itself the most conspicuously, and where it achieved its greatest works of creation, the movement was not exclusively Italian in origin. It was a general movement of the Western Society, which came to the surface wherever it was favoured by the presence of certain social conditions. These conditions were presented in some measure in other parts of Western Christendom besides Italy; and wherever they were to be found, the movement asserted itself.

The main conditions were two: the one economic and the other political. The economic condition was that the emergent city-states should command a sufficient field of commercial and industrial activity—a sufficiency of markets and of sources of supply—to enable them to live by commerce and industry instead of continuing to depend upon agriculture. The political condition was that there should be a sufficiently exact equilibrium—or sufficiently prolonged stalemate—in the local Balance of Power between the large-scale Powers of Western Christendom—the Papacy and the Empire and the peripheral kingdoms—to enable new Powers on the small scale of city-states to take possession of the no-man's-land between the evenly-matched and therefore temporarily immobilized titans.¹ These conditions were fulfilled in the case of Northern Italy; for Northern Italy was the pier-head² from which medieval Western Christendom was bound to conduct its overseas trade with the Syriac World and with Orthodox Christendom—two neighbouring worlds which in that age were both larger and richer than Western Christendom itself;³ and Northern Italy was also the no-man's-land in the long and stubborn contest for the headship over Western Christendom which was waged between the Papacy and the Holy Roman Empire. These were the conditions under which Northern Italy disengaged herself (*circa* A.D.

¹ It is one of the laws of the Balance of Power that, when and where it falls into an exactly stable equilibrium, this situation gives an opportunity for the emergence of new Powers, of lesser calibre, in the interstices between the existing Powers who are temporarily immobilized by the exactness of their balance with one another. This law is examined further in Part XI, below.

² For this function of Northern Italy in the primitive geographical structure of Western Christendom, see I. B (iv), vol. i, p. 38, above.

³ Italy was the physical bridge between Western Christendom and these two alien worlds; for when Western and Orthodox Christendom emerged simultaneously from the interregnum that followed the break-up of the Roman Empire, the Italian Peninsula was partitioned between them; and, thereafter, the possession of the Orthodox Christian part of Italy—that is, the 'heel' and the 'toe' and the Island of Sicily—was disputed between Orthodox Christendom and the re-emergent colonial Syriac Society of North-West Africa.

346 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
1158-1250) from the mass of Western Christendom as a constellation of virtually sovereign city-states. But the same conditions offered themselves in certain other places with similar results.

In Germany, for example, the rise of city-states was promoted economically by the debouchure, on German soil, of the overland trade-routes from Italy to Transalpine Europe through the Alpine passes and also by the northward and eastward expansion of Western Christendom—an expansion which gave Germany a seaboard on the Baltic and brought Scandinavia and Poland and Hungary within the radius of the German pioneers of Western trade.¹ At the same time, on the political plane, the rise of city-states in Germany was promoted indirectly by the struggle between the Empire and the Papacy in Italy—a struggle which sapped the strength of the Imperial Power in its German homeland and thus gave an opportunity for the Emperor's German feudatories to erect themselves into virtually independent princes. The resulting Balance of Power between the princes and the Emperor enabled rising city-states to shake themselves free in Germany as their elder sisters in Italy had been enabled to win their freedom through the Balance of Power between the Empire and the Papacy. In Flanders, again, the rise of city-states was promoted economically by the junction on Flemish soil of the overland trade-route from the Mediterranean (over Northern Italy and Southern and Western Germany) with the maritime trade-routes along the Atlantic and North Sea coasts and across the Straits between the Continent and the British Isles. Thereafter, the Flemish city-states were enabled to complete the achievement of their *de facto* political independence from the authority of the Count of Flanders, who was a feudatory of the Crown of France, by taking sides with the Crown of England in the Hundred Years' War (*inceptit* A.D. 1337).

Thus, by the middle of the fourteenth century of the Christian Era, the feudal darkness of the Western World was thickly sown with constellations of city-states; and these constellations were disposed in a commanding formation. At each of two points on opposite fringes of the Western firmament, in Italy and in Flanders, there was a star-cluster of such density that, within its own circumference, it wholly occupied the field of vision with a continuum of stellar light which left no rifts of darkness visible. Between the Italian and the Flemish cluster, across Swabia and the Rhineland, there stretched a star-riband of looser mesh and lesser luminosity, in the likeness of the Milky Way; and from the north-eastern flank of this terrestrial galaxy, in the neighbourhood of Cologne, the star-stream of the Hansa Towns shone out across Westphalia from the

¹ For this expansion, see II. D (v), vol. II, pp. 167-70, above.

banks of the Rhine to the shores of the Baltic. It will be seen that the new cosmos of city-states, which was taking shape in Western Christendom within the framework of the old cosmos of feudal tenures, had increased and multiplied with remarkable vitality during the three centuries or so that had elapsed since the beginning of its creation. The light was shining in the darkness from which it had been divided by the creative act; but the darkness comprehended it not. Would the light prevail over the darkness or the darkness reabsorb the light?¹ The moment had come when the Western Society must choose which world, of these two alternative and incompatible worlds, it was henceforth to be: the old feudal world or a new world of city-states.²

Before the end of the fourteenth century this issue had been

¹ In the ephemeral overseas world (*terre d'outre mer*) which medieval Western Christendom won for itself in 'the Crusades' at the expense of the moribund Syriac Society and the prematurely decadent Orthodox Christendom, the feudal cosmos which the Crusaders created in this new colonial domain in the twelfth and thirteenth centuries of the Christian Era actually was swallowed up, in the fourteenth and fifteenth centuries, by the new city-state cosmos which had latterly come into being in Italy.

At the time of the original conquests, which were mainly achieved in the First Crusade and in the Fourth, the lion's share of the conquered territories was parcelled out into feudal principalities, while the Italian maritime city-states, whose sea-power had contributed so much to the success of these joint Italian and Transalpine enterprises, had to content themselves with the acquisition of a number of comparatively small (though commercially and navally important) enclaves. By the end of the story, on the eve of the total extinction of Latin dominion in the Levant at the hands of the 'Osmanlis, the relative extent of the Italian and the Transalpine holdings of Latin territory in the Levant had been completely reversed. In so far as the *ci-devant* Frankish feudal principalities had not been reconquered by the Orthodox Christians and the Muslims, the remnants had been mostly preserved in virtue of their transfer from incompetent Transalpine to competent Italian hands. The change of régime which this transfer involved was striking; for, in the Frankish principalities overseas, the principles of feudalism had been carried to greater logical extremes, under artificial cultivation, than they had ever attained in their spontaneous growth on their native European soil, whereas the Italian colonial régimes which eventually took their place were anticipations of the modern Western methods of colonial exploitation.

The outstanding example of this process is the history of the Latin Kingdom of Cyprus, which was founded in A.D. 1191-2. As a result of a local conflict which broke out in A.D. 1372 between the Genoese and Venetian colonies in Cyprus, the reigning French dynasty of the House of Lusignan fell foul of the Genoese and was compelled to cede to the Genoese Republic the sovereignty over the port of Famagusta, with a monopoly of the foreign trade of the island. Famagusta was reconquered from the Genoese by the Cypriot Crown in A.D. 1464, but the enfeebled feudal power could only maintain itself by inviting a Venetian protectorate in A.D. 1466; and this protectorate duly led on, in the usual manner of protectorates, to annexation. In the last chapter of its history, from A.D. 1489 until the Ottoman Conquest in 1571, Latin Cyprus was a Venetian colony.

Another example is the Levantine career of the Acciajuoli—a family of Brescian steel-manufacturers who had settled in Florence and taken to banking. In A.D. 1334, Niccolò Acciajuoli, who was the confidential banker of the Angevin Court of Naples, took advantage of his financial and political transactions on behalf of his royal clients in order to acquire estates for himself in the Frankish feudal principality of Achaia. In 1358, Niccolò obtained from the ruling Angevin prince of Achaia the hereditary governorship of Corinth. Niccolò's sons mortgaged Corinth to their second cousin Nerio Acciajuoli; and in 1385-8 Nerio conquered the Frankish Duchy of Athens (which included Boeotia as well as Attica) from the Catalans, who had conquered it themselves from the French in 1311. The Florentine dominion in Central Greece which was thus established in 1388 lasted until the Turkish annexation of Athens in 1456 and of Thebes in 1460.

² For a comparison between the situations in fourteenth-century Western Christendom and in fifth-century Hellas, see further III. C (ii) (b), Annex IV, below.

decided, and decided against the new dispensation. A twentieth-century historian, looking back over the intervening span of Western history to the year 1400, can see plainly in retrospect that, by that date, the brilliant new world of city-states was already doomed to be abortive. But perhaps this decision would have been less readily apparent to a contemporary observer than it is to us to-day; for, although its historical consequences have been momentous, its actual execution was not sensational. The medieval Western cosmos of city-states was not blotted out in any single overwhelming cosmic catastrophe. Its fate was decided by the outcome of a number of local conflicts, no one of which was of oecumenical importance in itself. Their importance was the consequence of their aggregate effect; and this was largely hid from the eyes of the generation that took part in them.

In Italy, the light was dimmed by the destructive War of Chioggia (*gerebatur* A.D. 1378-81) between the two principal Italian maritime commonwealths, Genoa and Venice: an equivalent of the Atheno-Lacedaemonian War of 431-404 B.C. which left both protagonists permanently enfeebled. The year A.D. 1378 may also be taken as the beginning of an era of chronic and ubiquitous warfare between the Italian city-states on more scientific and professional and therefore more exhausting and ruinous lines than the earlier Italian fashion of conducting hostilities. The hundred and sixteen years between the outbreak of the War of Chioggia and the apparition of Charles VIII (A.D. 1378-1494) were the heyday of the Italian Condottieri. Thus, in the last quarter of the fourteenth century, the Italian city-states were setting themselves seriously to break one another's strength; and in the same decades the South and West German city-states allowed their strength to be broken by the local feudal princes.¹

The policy of these German city-states was ambitious. The example of the Swiss Confederation, which had found in its union the strength to contend against the Hapsburg Power since the turn of the thirteenth and fourteenth centuries, inspired the formation of a Swabian League of Cities in 1376 and a Rhenish League of Cities in 1381. These two leagues entered into an alliance with one another shortly afterwards; and in 1385 this alliance was extended to include some of the leading members of the Swiss Confederation. At the end of the year 1385, the efficacy of this new federal movement among the Central European city-states was put to the test by the outbreak of war between the Swiss Confederation and Leopold Hapsburg; and the Swabian and Rhenish allies of

¹ For this crisis in the fate of the city-states of Southern and Western Germany, see Clarke, M. V.: *The Mediaeval City State* (London 1926, Methuen), pp. 175-8.

the Swiss proclaimed as their war aim: 'Between the Forests of the Vosges, Thuringia, Bohemia, and the Lower Alps shall be a great union of free cities.'¹ If this large aim had been achieved, the fourteenth century of the Christian Era might have seen the ancient feudal body social of Western Christendom riven asunder by a solid wedge of confederated city-states extending right across the middle of Continental Europe from the Mediterranean and the Adriatic to the Channel and the North Sea and the Baltic.² In that event, the forces of Feudalism, divided by the enemy in their midst and unable to render one another mutual aid, might eventually have been driven off the field, to leave a new society of city-states in possession. But this prospect was barely opened up before it was decisively blotted out. At the critical moment, the Rhenish and Swabian cities hung back; the Swiss defeated Leopold Hapsburg at Sempach (in A.D. 1386) and 'set the seal on their independence' unaided; and two years later, when the Rhenish and the Swabian League found themselves at war, in their turn, with their own local feudal enemies, no Swiss help came to save them from defeat. Both these German Leagues were defeated decisively by the local German princes in A.D. 1388; and thereafter, in 1389, they were formally dissolved—'as contrary to God, the King, the Empire and the Law'—by the Holy Roman Emperor Wenceslas.

At about the same time, misfortunes of equal gravity befell the older and larger and stronger North German League of the Hansa, and also the Flemish cluster of city-states.

Flanders—which, as a stronghold of the new city-state régime in Western Christendom, was only second in importance to Italy itself—became subject in A.D. 1384 to a new line of Counts of the House of Burgundy; and in these Burgundian princes the Flemish burghers found their masters. It had been one thing to assert their civic liberties against the feudal lordship of a Count of Flanders who had no external resources beyond the fitful support of his usually embarrassed suzerain the King of France. It was quite another thing for them to contend with a Power which commanded the resources of territories outside Flanders itself³ and which was learning to make the most of these resources by applying the new-fangled Italian military and fiscal and administrative methods to

¹ This watchword was an adaptation of the Swiss watchword: 'Between the four forest cantons shall be a great Switzerland' (Clarke, *op. cit.*, p. 177).

² It will be noticed that the fourteenth-century zone of city-states (Northern Italy-Rhineland-Netherlands) approximately coincided in area (apart from the replacement of a Burgundian by a Swabian corridor) with the central slice of the Carolingian Empire which was assigned to Charlemagne's eldest grandson Lothaire in A.D. 843. (For the historical importance of Lothaire's portion, see I. B (iv), vol. 1, pp. 37-9, above.)

³ In the same year, 1384, in which the House of Burgundy acquired the County of Flanders, it enlarged its home territory—the French Duchy of Burgundy—by acquiring both the French County of Nevers and the Imperial County of Burgundy.

350 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
an old-fashioned Transalpine feudal principality.¹ From the establishment of Burgundian rule in Flanders in A.D. 1384 down to the incorporation of Flanders into Revolutionary France in A.D. 1795, the Flemish city-states remained subject to the House of Burgundy and its successive heirs, the Spanish and the Austrian Hapsburgs.

As for the Hansa League, it was overtaken before the end of the fourteenth century by the nemesis of the political pressure which, in furtherance of its commercial interests, it had brought to bear upon the converted barbarians on the northern and eastern periphery of an expanding Western Christendom. The *ci-devant* barbarians, finding themselves outmatched in efficiency by the Hansa and its partners the Teutonic Order, brought their quantitative superiority into play to compensate for their qualitative inferiority, and thereby succeeded in redressing the unequal balance.² The political union of Lithuania with Poland in A.D. 1386 was as great a blow to the Hansa Towns as it was to the Teutonic Knights; and the subsequent union of the three Scandinavian Kingdoms in A.D. 1397 completed the Hansa's discomfiture.³ For the next five centuries, the history of the Hansa Towns is the history of their successive absorption into other bodies politic of different structure and larger build. And the long process was completed in A.D. 1866 when the last three survivors—Hamburg, Lübeck, and Bremen—decided to merge themselves in the North German Confederation.⁴ Indeed, that merger may be regarded as the extinction of the last three stars of the innumerable host of city-states which had covered the face of Western Christendom five centuries earlier.

England in the Third Chapter of the Growth of the Western Society

Thus it was decided that Western Christendom should not be rearticulated into a society of city-states in order to facilitate the transmission of the new Italian version of the Western culture from Italy to Transalpine Europe. And since there was no room in Western Christendom for a kingdom-state cosmos and a city-state cosmos to exist side by side in perpetuity, this decision spelled the doom of the city-state régime even in its Italian and Flemish

¹ The House of Burgundy was a pioneer among the Transalpine dynasties which set themselves, in the fifteenth century, to transform their feudal principalities into autocracies by devices borrowed from Italy. ² See II. D (v), vol. ii, pp. 172-5, above.

³ The arrest of the expansion of the German city-states into the Baltic which was brought about by the political unification of the Scandinavians and of the Polono-Lithuanians in the fourteenth century of the Christian Era may be compared with the similar arrest of the expansion of the Greek city-states into the Western Mediterranean which was brought to a standstill in the sixth century B.C. by the political unification of the Etruscans and of the Transmarine Phoenicians.

⁴ The final completion of the process ought possibly to be dated in this year 1933, when Hamburg, Lübeck, and Bremen, together with all the other *Länder* of the German Reich, have lost the last vestige of their political individuality in the course of the German National-Socialist Revolution.

strongholds. Accordingly, if the new Italian culture was to be transmitted to the Western World at large or even to be preserved in its place of origin, it was thenceforth necessary that it should be adapted to the prevailing kingdom-state scale. It was only in so far as this adaptation could be accomplished that the Italian culture had a prospect of becoming 'the education of the Western World' under the actual conditions which had been set for its propagation before the end of the fourteenth century. In these circumstances, the Western Society was confronted with a new problem which may be formulated as follows. In the preceding chapter of Western history, a change-over from an agricultural aristocratic way of life to an industrial democratic way of life had been achieved by the Italians and the Flemings in two localities in Western Christendom at the price of reducing the unit-size of the local communities from the traditional and generally prevalent kingdom-state scale to a new city-state scale which had failed to acquire a general currency. In the next chapter of Western history, the problem was to discover how the new Italian and Flemish way of life could be lived, on the kingdom-state scale, by the Western World as a whole. This challenge was taken up in Switzerland and Holland and England, and it eventually received an English response.¹

In another connexion, we have noticed already² that all these three countries have been sheltered to an unusual degree by the inaccessibility of the local physical environment from challenges presented by the surrounding human environment. In other words, the inhabitants of all these three countries are well placed for withdrawing, if they choose, from the trammels of a regional society of which they find themselves members; and in the third chapter of the history of our Western Society the Swiss and the Dutch and the English have all in fact made efforts to shake themselves free from the entanglements of Western international politics in order to concentrate their energies upon the task of finding original solutions for the general Western problem of the age.

The Swiss, who had successfully surmounted the crisis of the city-state cosmos in the latter part of the fourteenth century, when

¹ A student of social geography will observe that in this new chapter of Western history the general pattern of the social map of Western Christendom is still the same as in the last chapter. The creative minorities that temporarily withdraw in order to find a response to the challenge of the day arise in the same two neighbourhoods on either flank of the Western World. England and Holland represent the same geographical 'node' as Flanders; Switzerland represents the same 'node' as Northern Italy. It will be noticed, however, that there is a general shift towards the North-West—from Italy to Switzerland across the Alps and from Flanders to England across the Straits—and also that the relative importance of the two 'nodes' is reversed. In the Italian-Flemish chapter, the South-Eastern Node is more important than the North-Western; in the English-Dutch-Swiss chapter, the North-Western Node is the principal focus of action. In the modern period, Holland and England count for more than Switzerland, whereas in the medieval period Italy counts for more than Flanders.

² In II. D (vii), vol. ii, on pp. 262-4 and 268, above.

352 THE PROCESS OF THE GROWTHS OF CIVILIZATIONS
the German and Flemish city-states had succumbed, succeeded in maintaining their political freedom, in the Swiss-Burgundian War of A.D. 1474-7, against the nearest of the new Italianized Transalpine Powers. *Vis-à-vis* the Holy Roman Empire, the Swiss Confederation secured *de facto* independence in A.D. 1499 and *de jure* independence in the Westphalian Peace Settlement of 1648.

The Dutch succeeded in winning their political freedom from the Spanish Hapsburg Power in the Dutch-Spanish War of A.D. 1572-1609; and, like the Swiss, they obtained the recognition of their *de jure* independence from the Holy Roman Empire in 1648, as part of the Westphalian Settlement.

The English, after having squandered their energies in the Hundred Years' War (A.D. 1337-1453) in order to win a Continental European empire, had found themselves at the end of the struggle in possession of less Continental territory than they had held at the moment when they embarked on this Continental adventure. In 1337 they had held Aquitaine; in 1453 they were left with nothing but Calais; and Calais went the way of all the other English possessions on the Continent in 1558. This experience cured the English of Continental ambitions; and then, in the next generation, they encountered the Continent in a still more disagreeable guise: not, this time, as a hazardous field for English military adventures in which England might burn her fingers, but as a formidable breeding-ground for aggressive Great Powers of supra-insular calibre which might use the Continent as a base of operations for bringing the island into political subjection. From the moment of Queen Mary's marriage to King Philip of Spain in A.D. 1554 the English were confronted by this new Continental danger; and the danger was only banned, after a generation of warfare against heavy odds, by the destruction of the Spanish Armada in 1588. The triumph of that year confirmed the outlook which had been first induced in English minds by the humiliations of 1429-53 and 1558. From that time onwards until the General War of A.D. 1914-18, the avoidance, as far as possible, of Continental European political entanglements was accepted, without further question, as one of the fundamental and perpetual aims of English foreign policy.¹

Thus the same policy of withdrawal was adopted, in their different circumstances, by the English, the Dutch, and the Swiss; but these three local minorities in the modern Western body social were not equally well placed for carrying this policy out, though they were all better placed for this purpose than any of their neigh-

¹ This statement requires some qualification in regard to British foreign policy during the period A.D. 1689-1815.

bours. In an age before the field of warfare had been extended to the air, the Swiss mountains were less effectually protective than the Dutch and English waters; and in an age before the invention of the steamship but after the invention of artillery, there was all the difference in the world between the breadth of a Dutch dyke, which was already too narrow to insulate Holland from the Continent, and the breadth of the English Channel, which was still broad enough to make the British Isles an *alter orbis*. The Dutch were found out by their Continental situation when they emerged incurably exhausted from their forty years' struggle (A.D. 1672-1713) against Louis XIV;¹ and thereafter, at the turn of the eighteenth and nineteenth centuries, both Holland and Switzerland were temporarily engulfed in the Napoleonic Empire.² On the other hand, England remained an *alter orbis* for three whole centuries until, in our own generation, she has been re-welded on to the military and political system of the Continent—and this time more closely than ever before in her history—by the ever-accelerating progress of those recent mechanical inventions which are largely the fruits of English ingenuity.³ In this post-war age, the English Channel is no broader—in the subjective human terms of measurement which have to be applied in this context—than a Dutch dyke in the age of Alva and William the Silent; and the Atlantic itself is no broader than the Channel at the time when Napoleon's army of invasion was encamped at Boulogne. It now seems not improbable that the fate of Holland in the eighteenth century may be the fate of England in the twentieth; but this possible coming change in England's position belongs to a new chapter in Western history which is only just beginning. The chapter that concerns us here is the last; and in that chapter the prolongation of England's period of privileged insulation for some two centuries beyond the term of Holland's enjoyment of the same privilege has been an historical fact of capital importance. Her prolonged immunity has enabled England to surpass and supplant Holland, in this chapter, in the role of the creative minority that withdraws from communion with Society in order to return in the fullness of time with an original solution for a general social problem.

¹ The experience of Holland in the General War of A.D. 1672-1713 was not unlike the experience of Athens in the Atheno-Peloponnesian War of 431-404 B.C. 'The Old Oligarch' (Pseudo-Xenophon: *Respublica Atheniensium*, ch. ii. 14-16) observes that the one defect of Athenian sea-power is that Attica itself is not an island. The observation is equally applicable to Holland, *mutatis mutandis*.

² Switzerland was as much in Napoleon's power *de facto* as Holland, though only the fringe of Switzerland was formally incorporated into France.

³ For this, see further Toynbee, A. J.: *The Conduct of British Empire Foreign Relations since the Peace Settlement* (London 1928, Milford), pp. 7-8, and the passages there quoted from an address on 'The Dominions and Foreign Policy' which was broadcast on the 14th November, 1924, by Lord Grey of Fallodon.

In the competition for this role between the three minorities in question the English also had the advantage over the Dutch and the Swiss in another way. The Kingdom of England—and *a fortiori* the subsequent United Kingdom of Great Britain—was a state of large calibre on the traditional Transalpine scale. Indeed, in the eighteenth century, after the Union between England and Scotland in A.D. 1707, Great Britain, while by no means the largest state in the Western World in point of sheer territorial magnitude, was by far the largest single area that had been consolidated into a really effective political and economic unity. And her political and economic unification on this large scale made Great Britain an admirable laboratory for solving the crucial Western problem of the day: the problem of finding ways and means of adapting to the original kingdom-state scale of the Western Society the latter-day city-state achievements. In this matter, both Holland and Switzerland were at a disadvantage because both these states were really survivals of the abortive city-state cosmos—a régime which had been preserved in these two localities behind the shelter of dykes and mountains when it had perished in other parts of Western Christendom. The Swiss Confederation and the United Netherlands were virtually two local combines of city-states;¹ and, from the institutional standpoint, they were anachronisms in the modern Western World—in the same category as the two surviving Italian city-states of Venice and Genoa. They were incapable, *a priori*, of solving the problem of the age, because they themselves were constructed on the city-state basis and therefore on the city-state pattern. For these several reasons, it was not in Switzerland or in Holland but in England that the problem was eventually solved.

The problem, as we have seen, was to emulate the social achievements of the city-state régime in kingdom-states with a feudal heritage; and these achievements had been three in number: the substitution of a democratic for an aristocratic form of government; the substitution of a commercial and industrial for a purely agricultural economy; and the introduction of a new standard of business-like efficiency into the conduct of both economics and politics. All these achievements had now to be emulated on the supra-city-state scale of the feudal kingdom; and the accomplishment which was actually translated on to the larger scale most rapidly and easily was efficiency on the political plane.

The first attempt to translate the accomplished political efficiency of the city-state on to a supra-city-state scale was made within the

¹ Juridically, the Swiss Confederation was a union of cantons and the United Netherlands a union of provinces; but in both commonwealths the principal constituent states were city-states *de facto*.

city-state cosmos itself. It declared itself in a widespread movement to weld local clusters of city-states together into larger commonwealths which should be as solid and as enduring as their individual city-state constituents. This movement was particularly active in Italy. At the opening of the fourteenth century of the Christian Era, the North and Central Italian regions of Lombardy, Romagna, Tuscany, Umbria, and the Marches were partitioned between seventy or eighty city-states; or, in other words, there was a larger number of fully-self-governing states in one-half of Italy in A.D. 1300 than can be counted in 1935 in the whole World. On the other hand, by the time of Machiavelli's death, in A.D. 1527, the number of sovereign states in the same Italian area had been reduced from seventy or eighty to ten, including the Papal Principality. Switzerland and Holland are monuments of the spread of the same movement of consolidation, at a later date, to those portions of the city-state cosmos that lay beyond the Alps. But the Swiss and the Dutch were more successful than the Italians in one respect. Swiss and Dutch statesmanship succeeded in welding a number of city-states together into larger commonwealths without abandoning the democratic kind of government that was the soul of political life under the city-state régime; and though their city-state federal structure debarred the Swiss and the Dutch from going on to make those new experiments in democratic government that were eventually made by the English, the Swiss and the Dutch did avoid the loss of their hereditary form of political liberty. In Italy, on the other hand, the benefits of territorial consolidation were purchased at the price of a forfeiture of political liberty in a twofold sense.

In the first place, when the seventy or eighty Italian city-states were welded together into ten agglomerations of seven or eight city-state units each on the average, the unification was not brought about here through the voluntary federation of the component states on an equal footing, but through the conquest and subjugation, in each case, of half a dozen weaker city-states by some powerful and domineering neighbour. The Grand Duchy of Tuscany was the outcome of the conquest of Fiesole and Volterra and Arezzo and Pistoia and Pisa and Siena¹ by Florence. The Venetian dominions on the Continent were built up by the imposition of

¹ The territory of Siena was only annexed by Florence or, rather, partitioned between Florence and Spain, in A.D. 1557, thirty years after Machiavelli's death. It was after this, again, that the Florentine Commonwealth was officially transformed into the Grand Duchy of Tuscany. (The title was conferred on the ruling Medici Duke of Florence by the Pope in A.D. 1567 and was recognized by the Holy Roman Emperor in A.D. 1576.) The foregoing siege and capture of Siena, in 1555, by a combined Florentine-Spanish expeditionary force was as brutal an act of conquest as any of the preceding steps in the formation of the Florentine empire.

Venetian rule upon Treviso and Padua and Vicenza and Verona and Brescia and Bergamo. The Papal State was rounded off—or, in theory, reconstituted—by the political degradation of the former city-states of Bologna and Ferrara to the status and style of 'the Legations'. There was, of course, a considerable variety in the imperial policy of these different empire-building Italian Powers. The city-states that fell under the Venetian hegemony were comparatively well treated, whereas Pisa was deliberately and malignantly ruined by her Florentine conquerors in the fifteenth century. As for the vigorous and turbulent Bolognesi, they could never reconcile themselves to being governed as a satrapy of the Holy See by Papal Legates. The local conditions and reactions varied; but the forfeiture of political liberty was the general rule, and downright oppression at the hands of the conquering Power was not infrequent. This was one sense in which the territorial consolidation of Italy entailed the loss of political freedom; and in the second place the empire-building city-states—with the notable exception of Venice¹—all paid for their dominion over their neighbours by the loss of their own domestic liberties before the process of empire-building was completed. The formation of these miniature Italian empires was contemporary with the rise of the Italian despots who were the miniature predecessors of a Transalpine Louis XI or Henry VII; and these two Italian political developments were not only contemporary but were inter-connected. A city-state which had set its heart upon conquering its neighbours could not accomplish this formidable ambition with the amateur instruments of a civic militia and a republican constitution. Imperialism required a professional army of mercenaries; and a mercenary force required in its turn a despotic government with the twofold function of keeping the mercenaries in order and organizing the city's resources to maintain them. Venice was the only Italian city-state that succeeded in building up an Italian empire without finding itself driven to place the lives and fortunes of its own citizens in the hands of an autocrat.

This price which was paid in Italy for the reduction of the number of Italian states from seventy or eighty to ten was actually paid in vain from the Italian standpoint; for the new Italian principalities, large as they were by comparison with the former Italian city-states, were still not large enough to serve the purpose of enabling them to hold their own against the Transalpine Powers. They might, perhaps, have held their own if the Transalpine Powers

¹ Genoa, of course, besides Venice, retained her republican institutions, as well as her independence, until she was engulfed in the Napoleonic Empire; but Genoa can hardly be reckoned among the empire-building Italian city-states, for none of the communities on the Riviera which she brought under her rule were of anything like her own calibre.

had remained enveloped in their ancient feudal darkness without receiving any irradiation of Italian light; and there was possibly a period in the fourteenth century when the Duchy of Milan or the Commonwealth of Venice was capable of holding its own against the House of Anjou or the House of Luxemburg. This theoretical equilibrium, however, was of short duration, if it ever really existed; for Italian political efficiency in the shape of Italian despotism proved to be the easiest of all Italian accomplishments to acclimatize in Transalpine Europe and to accommodate to the Transalpine scale; and before the end of the fifteenth century every one of the latter-day Italian principalities had been decisively outclassed in political strength by the new Italianized autocracies of Louis XI in France and Ferdinand and Isabella in Spain and Henry VII in England.¹

This propagation of Italian autocracy beyond the Alps was

¹ In Hellenic history, the analogue of the relation between political despotism and territorial consolidation in the history of modern Italy is to be found, not in the Hellenic World at large and not in Continental Greece or in the Aegean, but in the colonial domain of Hellas in Sicily and Magna Graecia.

In Continental Greece, despotism and consolidation did not go together. On the contrary, the city-states round about the Isthmus of Corinth were associated in an interstate union for the first time in their histories at the moment when they were liberated from the despots who had ruled them during the seventh and the sixth centuries B.C. The overthrow of the Isthmian despots and the formation of the Peloponnesian League were both the work of the Spartan Government; and these two Spartan acts were not only simultaneous but were actually two complementary parts of a single policy.

In Sicily and Magna Graecia, on the other hand, Hellenic history developed on lines which are parallel to the modern Italian developments which we have just been examining. In this western region of the Hellenic World, the movement towards consolidation in the fifth and fourth centuries B.C. was more radical and more persistent than any corresponding movement in Continental Greece until the Aetolian and Achaean movements of the third century. And whereas these Achaean and Aetolian movements, when they came, resembled the modern Swiss and Dutch movements in seeking to reconcile solidarity with liberty and equality, the earlier movement in Sicily and Magna Graecia resembled the modern Italian movement in both its leading characteristics. In Hellenic Sicily and Magna Graecia, as in modern Italy, the process of consolidation did not take place voluntarily on a footing of equality, but was accomplished through the subjugation of the weaker city-states by the stronger (a subjugation which went much further than the 'hegemonies' that were being imposed in the same age upon the weaker city-states of Continental Greece and the Aegean by Athens and Sparta and Thebes). A Catana and a Leontini were dealt with by a Syracuse as ruthlessly as Florence dealt with Arezzo or with Pisa, while the dominion which was established by Tarentum over Metapontum and Heraclea and Messapia was as positive as the Venetian dominion over Treviso and Padua and Friuli. Again, the persistent republicanism of empire-building Tarentum was as much of an exception in Magna Graecia and Sicily as the persistent republicanism of Venice in Italy. The typical story was the story of Syracuse, in whose history empire-building went hand in hand with despotism at home, as it went in Milan or Florence. The Milanese Visconti and the Florentine Medici of our modern Western history have their Hellenic analogues in the successive dynasties of Syracusan despots: the Deinomenidae (circa 485-466 B.C.), the Dionysii (405-344 B.C.), Agathocles (316-289 B.C.), and Hiero with his grandson Hieronymus (266-214 B.C.).

Finally we may observe that the consolidation of the Greek city-states of Sicily and Magna Graecia under the empires of Syracuse and Tarentum in the fifth and fourth and third centuries B.C. was as ineffectual as the consolidation of the Italian city-states under the empires of Milan and Venice and Florence in the fourteenth and fifteenth and sixteenth centuries of the Christian Era for the purpose of enabling these little principalities to hold their own against the surrounding 'barbarians'. The Greeks of Sicily and Magna Graecia suffered the same fate at the hands of the Carthaginians and the Oscans and the Romans that the Italians suffered at the hands of the Hapsburgs and the Bourbons.

It will be seen that the parallel works out with remarkable exactitude.

Italy's undoing; but it brought the Transalpine countries no equivalent gain because this Italian political efficiency was only one of the Italian accomplishments which Transalpine Europe had to assimilate. Transalpine Europe would not be laying hands upon the greatest political gift that Italy had to give her until she found for herself some equivalent of the Italian political democracy which Italy herself had already lost; and without the achievement of some kind of political democracy it was difficult for the Transalpine countries to emulate the Italian economic accomplishment of advancing from agriculture to commerce and industry.
